PREFACE

The twenty-seventh issue of the NEW INTERNATIONAL YEAR BOOK covering the year 1928 continues this useful series long since established as a convenient and necessary aid to those who would appreciate world affairs and understand the history of their own times. The YEAR BOOK requires little in the way of introduction or explanation, as its purpose and function are quite as apparent to those using it for the first time as to the habitual reader. However, it is desirable to call attention to certain features appropriate to the year as well as innovations and developments which aim to make the YEAR BOOK even more serviceable to its readers. International in scope as well as in title, it presents the usual authentic summaries of statistics, progress, and history, for the nations of the world. In the UNITED STATES the historical record deals comprehensively with the Presidential Election of 1929, reciting the party differences, the actions of the National Conventions, and the progress and results of the political campaign. PROHIBITION continued not only as a great social experiment, but as a topic of general discussion and engrossing political concern. Accordingly, the YEAR BOOK carries along its dispassionate summary in an unbiassed manner which follows and supplements similar accounts in previous volumes, and taken in connection with them supplies an interesting history of this movement. PUBLIC FINANCE, though less striking, is of hardly minor importance, while TAXATION is equally a subject of general interest.

In Europe, the political affairs of the various countries and their continued attempts to attain increased economic stability are discussed under the heads of the different nations, along with the more significant and recent statistics. Naturally, the countries of Europe must be considered in their relations to such developments of the World War as the LEAGUE OF NATIONS, the present state of the REPARATIONS situation, and the growth of the WORLD COURT. In JAPAN, a new ruler was placed on the throne; in CHINA, the political situation continued involved and unsettled, while in INDIA, there were rumblings of unrest. Returning to the American Continent, the PAN-AMERICAN CONFERENCE held at Havana aroused general interest as a matter of world concern, while the South American tour of President-elect Hoover held possibilities of importance later to be revealed.

Individuals make the history of nations, and there will be found not only the usual obituary sketches of prominent persons who died during the year, but an enlarged and complete NECROLOGY which has been extended in scope over that of previous issues to afford information as to the lives of individuals of general or special interest.

In the YEAR BOOK's list of contributors will be found the names of a number of new authors and contributing editors as the result of a policy involving a further subdivision of departments and the securing of authorities more qualified to write in their respective fields. Thus, in Civil Engineering and Electrical Engineering, recognized educators and engineers have taken over these important departments, and such articles as BRIDGES, DAMS, DYNAMO-ELECTRIC MACHINERY, ELECTRIC POWER PLANTS, POWER, RADIO TELEPHONY AND BROADCASTING are adequately summarized. For the first time in the YEAR BOOK, adequate space is given to

PREFACE

PHOTOGRAPHY in a special article and the important progress of the year in this field is treated by a recognized expert. Under AUTOMOBILES, an interesting summary from the economic as well as the engineering standpoint is presented by a special writer. In PHILOSOPHY and PSYCHOLOGY, two new contributors of academic reputation present the developments in these respective fields.

Not only are the usual summaries in English and other literatures as carried for a number of years retained, but in this YEAR BOOK there is added a comprehensive sketch on ITALIAN LITERATURE; while under MODERN PHILOLOGY the outstanding advances in this field allied to literature are indicated. The striking developments in National and International Finance and Industry, requiring as they do for complete understanding an appropriate background, are summarized by a leading economist. In fact, throughout the fields of Art, Science, Education, Religion, Politics, and other activities, the YEAR BOOK continues to record the progress of the interesting year 1928, which marked the end of the ten-year period since the termination of hostilities at the Armistice in 1918.

In the preparation of this volume, the editor and the contributors must acknowledge the friendly coöperation and assistance from many agencies official and otherwise. It almost might seem from the aid thus furnished by the bureaus of the Federal and State governments, from the Dominion Bureau of Statistics of Canada, from various foreign governmental agencies, not to mention leading educational institutions, religious bodies, and learned and other societies, that all not only were actually interested in the undertaking but were proud to consider themselves as in a measure responsible for its preparation. Accordingly, to them, as well as to such industrial organizations as the General Electric Company, the American Telephone and Telegraph Company, the Silk Association of America, the Rubber Association of America, American Paper and Pulp Association, the American Gas Association, and many other friends, individual as well as corporate, the thanks of the editor and publishers are extended.

HERBERT TREADWELL WADE.

EDITOR
HERBERT TREADWELL WADE

LIST OF CONTRIBUTORS

AGRICULTURE, BOTANY, FOOD, FORESTRY, HORTICULTURE, ETC.

EDWIN WEST ALLEN, PH.D.,
UNITED STATES DEPARTMENT OF AGRICULTURE,
AND
ALFRED CHARLES TRUE, PH.D.,
UNITED STATES DEPARTMENT OF AGRICULTURE;
WALTER H. EVANS, PH.D. (BOTANY AND
PLANT DISEASES); JOHN I. SCHULTE (CROP
PRODUCTION); GEORGE HAINES (LIVESTOCK;
DAIRYING); WALTER H. BEAL (FERTILIZERS
AND SOILS); SYBIL L. SMITH (FOOD AND
NUTRITION); HOWARD L. KNIGHT (AGRICULTURAL
LEGISLATION); JOSEPH W. WELLINGTON (HORTICULTURE
AND FORESTRY); AND WILLIAM A. HOOKER (ECONOMIC
ENTOMOLOGY; VETERINARY MEDICINE).

ANTHROPOLOGY (WITH ETHNOLOGY)

LESLIE SPIER, PH.D.,
PROFESSOR OF ANTHROPOLOGY, UNIVERSITY OF
OKLAHOMA.

ARCHAEOLOGY

OLIVER SAMUEL TONKS, PH.D.,
PROFESSOR OF ART, VASSAR COLLEGE.

ARCHITECTURE

TALBOT F. HAMLIN,
MEMBER OF AMERICAN INSTITUTE OF ARCHITECTS.

ASTRONOMY; METEOROLOGY; EARTHQUAKES; FLOODS; RELATIVITY

EDGAR W. WOOLARD,
DEPARTMENT OF MATHEMATICS, GEORGE WASHINGTON
UNIVERSITY.

AUTOMOBILES

HENRY R. COBLEIGH, M.E.,
SECRETARY OF SERVICE, NATIONAL AUTOMOBILE
CHAMBER OF COMMERCE.

BIOGRAPHY

CHARLES N. LURIE,
EDITOR, *New York Times Index*
FRANCES N. CHRYSTIE.

CHEMISTRY; EXPOSITIONS; CELEBRATIONS

MARCUS BENJAMIN, PH.D., Sc.D., LL.D.,
EDITOR FOR THE UNITED STATES NATIONAL
MUSEUM.

CIVIL ENGINEERING

JAMES K. FINCH, C.E.,
PROFESSOR OF CIVIL ENGINEERING, COLUMBIA
UNIVERSITY.

DRAMA AND THEATRE

RALPH W. CAREY,
NEW YORK DRAMATIC CORRESPONDENT, *The
Hartford Courant*.

**ECONOMIC, SOCIAL, AND POLITICAL
SCIENCE SUBJECTS**

LOUIS M. HACKER, A.M.

EDUCATION; UNIVERSITIES

MILO B. HILLEGAS, PH.D., LL.D.,
PROFESSOR OF EDUCATION, COLUMBIA UNIVERSITY.

ELECTRICAL ENGINEERING SUBJECTS

WALTER I. SLICHTER, E. E.,
PROFESSOR OF ELECTRICAL ENGINEERING, COLUMBIA
UNIVERSITY.

EUROPEAN HISTORY AND GAZETTEER

IRWIN SCOFIELD GUERNSEY, A.M.,
PROFESSOR OF AMERICAN HISTORY, DE WITT CLINTON
HIGH SCHOOL, NEW YORK CITY.

EXPLORATION; POLAR RESEARCH

MARGARET WARTHIN, M.S.

**FINANCIAL REVIEW; BANKS AND
BANKING; BUSINESS REVIEW; PUBLIC
FINANCE; TAXATION**

H. PARKER WILLIS, PH.D.,
EDITOR, *The Journal of Commerce*, NEW YORK;
PROFESSOR OF BANKING, COLUMBIA UNIVERSITY.

FRENCH LITERATURE

ALBERT SCHINZ, PH.D.,
PROFESSOR OF ROMANIC LANGUAGES AND LITERATURES,
UNIVERSITY OF PENNSYLVANIA.

GEOLOGY

DAVID HALE NEWLAND,
STATE GEOLOGIST OF NEW YORK.

GERMAN LITERATURE

AMELIA VON ENDE.

INSURANCE

WILLIAM S. CRAWFORD,
INSURANCE EDITOR, *The Journal of Commerce*,
NEW YORK.

ITALIAN LITERATURE

O. A. BONTEMPO, PH.C.,
ROMANCE LANGUAGE DEPARTMENTS, COLUMBIA
UNIVERSITY AND NEW YORK UNIVERSITY; DIRECTOR,
ITALICA ASSOCIATION OF AMERICA;
EDITORIAL STAFF, *Romanic Review*.

**INTERNATIONAL ARBITRATION; INTERNATIONAL
LAW; LEAGUE OF NATIONS; WORLD COURT; PEACE
MOVEMENTS; ETC.**

CLINTON ROGERS WOODRUFF, LL.D.,
HONORARY SECRETARY OF THE NATIONAL MUNICIPAL
LEAGUE AND MEMBER OF THE MOHONK CONFERENCE;
FORMERLY PRESIDENT OF THE BOARD OF PERSONAL
REGISTRATION, PHILADELPHIA.

LABOR LEGISLATION

JOHN B. ANDREWS, PH.D.,
SECRETARY OF THE AMERICAN ASSOCIATION FOR
LABOR LEGISLATION AND EDITOR OF *American
Labor Legislation Review*.

LITERATURE, ENGLISH AND AMERICAN

WILLIAM BENFIELD PRESSEY, A.M.,
ASSISTANT PROFESSOR OF ENGLISH, DARTMOUTH
COLLEGE.

MANUFACTURES: AERONAUTICS

HERBERT TREADWELL WADE

MEDICAL SUBJECTS

EDWARD PREBLE, M.D.

METALLURGY

EDWARD HODGES ROBIE,
ASSOCIATE EDITOR OF *Engineering and Mining
Journal*.

MILITARY PROGRESS

JOHN J. BRADLEY,
COLONEL, INFANTRY, UNITED STATES ARMY,
RETIRED.

MINERALOGY

HERBERT P. WHITLOCK, C.E.,
CURATOR, DEPARTMENT OF MINERALOGY, AMERICAN
MUSEUM OF NATURAL HISTORY, NEW YORK
CITY.

MUSIC

ALFRED REMY, M.A.,
EDITOR, *Baker's Biographical Dictionary of
Musicians*; FORMERLY EXTENSION LECTURER,
COLUMBIA UNIVERSITY; AND LECTURER ON THE
HISTORY OF MUSIC, NEW YORK COLLEGE OF MU-
SIC.

NAVAL PROGRESS AND RELATED SUBJECTS

LEWIS SAYRE VAN DUZER,
CAPTAIN UNITED STATES NAVY, RETIRED; WRITER
ON NAVAL AND NAUTICAL SUBJECTS.

PAINTING AND SCULPTURE

JEAN LEONARD,
ASSISTANT, EDITORIAL DIVISION,
METROPOLITAN MUSEUM OF ART.

PHILOLOGY (CLASSICAL)

CHARLES KNAPP, PH.D.,
PROFESSOR OF GREEK AND LATIN, BARNARD COL-
LEGE, COLUMBIA UNIVERSITY; MANAGING EDI-
TOR OF *The Classical Weekly*.

PHILOLOGY (MODERN)

JOHN LAWRENCE GERIG, PH.D., LITT.D.,
AD. HON. (UNIVERSITY OF ROME); PROFESSOR
OF CELTIC, EXECUTIVE OFFICER, DEPARTMENT OF
ROMANCE LANGUAGES, COLUMBIA UNIVERSITY;
HONORARY DIRECTOR, DEPARTMENT OF SPANISH
STUDIES, UNIVERSITY OF PORTO RICO; CAVA-
LIERE DELLA CORONA D'ITALIA; CHEVALIER DE LA
LEGION D'HONNEUR; EDITOR OF *Romanic Re-
view*, etc.

PHILOSOPHY

V. JERAULD MCGILL, PH.D.,
PROFESSOR OF PHILOSOPHY, BARNARD COLLEGE,
COLUMBIA UNIVERSITY.

PHOTOGRAPHY

GLENN E. MATTHEWS, M.S.C.,
TECHNICAL EDITOR, KODAK PARK RESEARCH
LABORATORIES, ROCHESTER, N. Y.

PHYSICS

HENRY D. HUBBARD,
SECRETARY, UNITED STATES BUREAU OF STAND-
ARDS.

POWER ENGINEERING; POWER PLANTS; ETC.

ALFRED D. BLAKE, M.E.,
ASSOCIATE EDITOR OF *Power*.

PSYCHICAL RESEARCH

WALTER FRANKLIN PRINCE, PH.D.,
RESEARCH OFFICER, THE BOSTON SOCIETY FOR
PSYCHICAL RESEARCH.

PSYCHOLOGY; PSYCHOANALYSIS

ALBERT T. POFFENBERGER, PH.D., SC.D.,
PROFESSOR OF PSYCHOLOGY, COLUMBIA UNIVER-
SITY.

RADIO TELEPHONY AND BROADCASTING

JOHN HAROLD MORECROFT, E.E.,
PROFESSOR OF ELECTRICAL ENGINEERING, COLUM-
BIA UNIVERSITY.

RAILWAYS

WILLIAM E. HOOPER,
FORMER FINANCIAL EDITOR, *Railway Age*.

RELIGIOUS BODIES AND SOCIETIES

ELLEN NELSON COLLERAN, A.M.,
OFFICE EDITOR.

ROMAN CATHOLIC CHURCH

THOMAS F. MEEHAN,
EDITORIAL STAFF, *America*.

SANITARY ENGINEERING AND MUNICIPAL SUBJECTS

MOSES NELSON BAKER, PH.D., C.E.,
ASSOCIATE EDITOR OF *Engineering News-Record*.

SCANDINAVIAN LITERATURE

HARRY V. E. PALMBLAD, PH.D.,
PROFESSOR OF GERMAN AND FRENCH, PHILLIPS
UNIVERSITY.

SPANISH LITERATURE; SPANISH-AMERICAN LITERATURES

JOHN D. FITZ-GERALD, PH.D., LITT.D.,
PROFESSOR OF ROMANCE PHILOLOGY, UNIVERSITY
OF ILLINOIS; MEMBER OF THE HISPANIC SO-
CIETY OF AMERICA; CORRESPONDING MEMBER OF
THE SPANISH ROYAL ACADEMY AND OF THE
ROYAL ACADEMY OF HISTORY OF MADRID; HON-
ORARY MEMBER OF THE NATIONAL ACADEMY
OF ARTS AND LETTERS OF CUBA; COMENDADOR
CON PLACA DE LA REAL ORDENDE ISABEL LA
CATOLICA.

SPORTS

CHARLES A. TAYLOR,
SPORTING DEPARTMENT, *New York American*.

UNITED STATES AND STATE ARTICLES

PHILIP COAN,
EDITORIAL STAFF, *The Brooklyn Daily Eagle*;
FORMER EDITOR, *The New York Sun*.

ZOOLOGY AND EVOLUTION

AARON L. TREADWELL, PH.D.,
DEPARTMENT OF ZOOLOGY, VASSAR COLLEGE.

KEY TO PRONUNCIATION

ā as in ale, fate. Also see **ɛ**, below.
â " " senate, chaotic.
â " " glare, care, and as *e* in there. See **ɛ**, below.
ā " " am, at.
ā " " arm, father.
ā " " ant, and final *a* in America, armada, etc.
 In rapid speech this vowel readily becomes more or less obscured and like the neutral vowel or a short *u* (**ū**).
“ " " final, regal, where it is of a neutral or obscure quality.
a " " all, fall.
ē " " eve.
ē " " elate, evade.
ē " " end, pet. The characters **ɛ**, **ā**, and **ā** are used for **ā**, **ae** in German, as in Baedeker, Gräfe, Händel, to the values of which they are the nearest English vowel sounds. The sound of Swedish **ā** is also sometimes indicated by **ɛ**, sometimes by **ā** or **ā**.
ɛ " " fern, her, and as *i* in sir. Also for **ō**, **oe**, in German, as in Göthe, Goethe, Ortel, Oertel, and for **eu** and **œu** in French, as in Neufchâtel, Crèvecœur; to which it is the nearest English vowel sound.
e " " agency, judgment, where it is of a neutral or obscure quality.
i " " ice, quiet.
i " " quiescent.
i " " ill, fit.
ō " " old, sober.
ō " " obey, sobriety.
ō " " orb, nor.
ō " " odd, forest, not.
o " " atom, carol, where it has a neutral or obscure quality.
oi " " oil, boil, and for **eu** in German, as in Feuerbach.
ō " " food, fool, and as *u* in rude, rule.
ou " " house, mouse.
ū " " use, mule.
ū " " unite.
ū " " cut, but.
u " " full, put, or as *oo* in foot, book. Also for **ū** in German, as in München, Müller, and *u* in French, as in Buchez, Budé; to which it is the nearest English vowel sound.
û " " urn, burn.
y " " yet, yield.
B " " the Spanish Habana, Córdoba, where it is like a *v* made with the lips alone, instead of with the teeth and lips.
ch " chair, cheese.

D as in the Spanish Almodovar, pulgada, where it is nearly like *th* in English then, this.
g " " go, get.
g " " the German Landtag, and **ch** in Feuerbach, buch; where it is a guttural sound made with the back part of the tongue raised toward the soft palate, as in the sound made in clearing the throat.
h " **j** in the Spanish Jijona, **g** in the Spanish gila; where it is a fricative somewhat resembling the sound of **h** in English hue or **y** in yet, but stronger.
hw " **wh** in which.
κ " **ch** in the German ich, Albrecht, and **g** in the German Arensberg, Mecklenburg; where it is a fricative sound made between the tongue and the hard palate toward which the tongue is raised. It resembles the sound of **h** in hue, or **y** in yet; or the sound made by beginning to pronounce a **k**, but not completing the stoppage of the breath. The character **κ** is also used to indicate the rough aspirates or fricatives of some of the Oriental languages, as of **kh** in the word Khan.
ñ " " in sinker, longer.
ng " " sing, long.
N " " the French bon, Bourbon, and **m** in the French Étampes; where it is equivalent to a nasalizing of the preceding vowel. This effect is approximately produced by attempting to pronounce "onion" without touching the tip of the tongue to the roof of the mouth. The corresponding nasal of Portuguese is also indicated by **N**, as in the case of São Antão.
sh " " shine, shut.
th " " thrust, thin.
th " " then, this.
zh " **z** in azure, and **s** in pleasure.
 An apostrophe [**’**] is sometimes used to denote a glide or neutral connecting vowel, as in **tā'b'l** (table), **kāz'm** (chasm).
 Otherwise than as noted above, the letters used in the respellings for pronunciation are to receive their ordinary English sounds.
 When the pronunciation is sufficiently shown by indicating the accented syllables, this is done without respelling; as in the case of very common English words, and words which are so spelled as to insure their correct pronunciation if they are correctly accented. Pronunciation is discussed in the NEW INTERNATIONAL ENCYCLOPEDIA.

THE NEW INTERNATIONAL YEAR BOOK

ABBE, ROBERT. American surgeon and educator, died at New York, March 7. He was born at New York, Apr. 13, 1851, and was graduated from the College of the City of New York in 1870 (A.B.), and from the College of Physicians and Surgeons, Columbia University, in 1874 (M.D.). While studying medicine he served for two years as an instructor in English, drawing and mathematics at the College of the City of New York. He was a general medical practitioner before becoming, in 1877, attending surgeon in the out-patient department of the New York Hospital. Among the other positions which he held were those of professor of didactic surgery at the Women's Medical College, surgeon to St. Luke's Hospital and to the New York Cancer Hospital, professor of surgery at the New York Post-Graduate Medical School, and lecturer of surgery at the College of Physicians and Surgeons. He specialized in the study and treatment of cancer, and was the first surgeon in America to substitute radium treatment for the knife. He spent some time in Paris with M. and Mme. Curie, and wrote a book about them and their work. Dr. Abbe retired from active practice and teaching in 1923.

ABBOT, FREDERIC VAUGHAN. American military engineer, died at Nonquitt, Mass., September 26. He was born at Cambridge, Mass., Mar. 4, 1858, and having been graduated from the United States Military Academy in 1879, he was commissioned second lieutenant in the Corps of Engineers on June 13 of that year. He rose through the successive grades until he was made brigadier general, Aug. 5, 1917. He served with the engineer battalion at Willetts Point, N. Y., 1879-82, and becoming assistant to Major Ernst, he worked on the survey of the boundary line between Maryland and Virginia 1883-84. For the next four years he was assistant to Colonel Gilmore, until he was put in charge of various defenses, and of river and harbor projects in South Carolina. He was lighthouse engineer of the Sixth District 1895-97, in the latter year being given charge of river and harbor works in Wisconsin and Minnesota. From 1900-10, he served as assistant to the Chief Engineers of the United States Army, later taking charge of harbor and defense works in Massachusetts and Rhode Island. In 1913 he was placed in charge of river and harbor engineering in the Third New York District, acting in this capacity until he was put in charge of the defenses at the southern and eastern entrance of the New York Harbor in 1915. In 1917 he was made

principal assistant to the Chief of Engineers, and commanding officer at Washington Barracks. He was acting Chief of Engineers from 1918 to 1919 and retired May 10, 1920.

ABORTION IN LIVESTOCK. See VETERINARY MEDICINE.

ABYSSINIA. See ETHIOPIA.

ACADEMY, FRENCH (ACADEMIE FRANÇAISE). The oldest of the five academies which make up the Institute of France, and officially considered the highest; founded in 1635, reorganized in 1816. The membership is limited to 40. The list of the Immortals at the beginning of 1928, in order of their election, was as follows: Paul Bourget; Gabriel Hanotaux; Henri Lavedan; René Bazin; Maurice Donnay; Raymond Poincaré, Eugène Brieux; René Doumic; Marcel Prévost; Henri de Régnier; le maréchal Louis Lyautey; Pierre de La Gorge; Henri Bergson; le maréchal Joseph Joffre; Louis Barthou; Monseigneur Alfred Baudrillart; le vicomte François de Curel (died, April 26); Jules Cambon; Georges Clémenceau; le maréchal Ferdinand Foch; Henry Bordeaux; Charles Bédier; André Chevrillon; Pierre de Nolhac; Georges Goyau; Marie Bremond; Georges de Porto-Riche; Edouard Estaunié; Henri Robert; Camille Julian; Georges Lecomte; Émile Picard; Albert Besnard; Émile Bertrand; Joseph de Chaumont, duc de La Force; Paul Valéry; Abel Bermant; Émile Male; Louis Madelin.

Émile Male was formally received in a public meeting in June. On June 7, Maurice Paléologue, diplomat and writer, was elected to membership in the Academy to fill the place made vacant by the death of Charles Jonnart, also a diplomat, who died in September, 1927. M. Paléologue, a descendant of the Byzantine Emperors, was born at Paris in 1859. He represented France at the marriage of the Spanish King in Madrid in 1906, served as French Ambassador in Rome, and has written a number of books on art, archaeology, and diplomatic subjects. He was formally received into the Academy in December.

M. Hermant, who was received into the Academy at the February meeting, was elected in 1927 to occupy the chair of René Boylesse, a case of one novelist succeeding another. He had published 103 volumes at the time of his election.

Late in the year the Academy awarded to André Perraud-Charmentier le prix du Budget of 2000 francs, for a monograph on *Le droit de réponse en matière de presse*, and two triennial awards of 3000 and 1500 francs to MM.

Langrand and Letellier. At the monthly meetings of the Academy, considerable time was devoted to the revision of its dictionary, in the consideration of certain words, each one being dealt with in all its meanings, uses, etc. See FRENCH LITERATURE; MODERN PHILOLOGY, *France*. The permanent secretary of the Academy is René Doumic, and the director, elected annually, was Émile Picard. The annual meeting is held in November.

ACADEMY OF ARTS AND LETTERS, AMERICAN. A society founded in 1904 by members of the National Institute of Arts and Letters, and incorporated and given a charter by Act of Congress approved April 17, 1916. The purposes of the organization are the furtherance of the interests of literature and the fine arts. The membership, limited to 50 chairs, is similar to that of the French Academy, and vacancies caused by death are filled by election by the members from the National Institute on the basis of life-time achievement in literature, painting, sculpture, architecture, and music.

At the annual meeting in November, 1928, announcement was made that the Academy had received funds for the erection of a new building, near the site of the headquarters building. The session was also made the occasion of the opening of an exhibition of the works of the late Edwin Austin Abbey, and plans were made for the observance of the twenty-fifth anniversary of the Academy in 1929. At this meeting Prof. Bliss Perry of Harvard read a paper in appreciation of William Crary Brownell, literary critic and author, who died on July 22, and a tribute was paid to William Milligan Sloane, historian, and late president of the Academy, who died on September 11, by Dr. Henry van Dyke. A third member of the Academy, William Rutherford Mead, architect, who died at Paris, June 20, 1928, was to be honored at a special meeting, for which plans were being formed. At a meeting of the Board of Directors in October, 1928, Dr. Nicholas Murray Butler, was unanimously elected president of the Academy, to succeed the late Prof. Milligan Sloane and was reelected as president at the annual meeting.

The membership at the time of the annual meeting on November 8, included the following in order of election: Daniel Chester French; Robert Underwood Johnson; Henry van Dyke; Arthur Twining Hadley; Edwin Howland Blashfield; Thomas Hastings; Brander Matthews; George Edward Woodberry; George Whitefield Chadwick; George de Forest Brush; Bliss Perry; Abbott Lawrence Lowell; Nicholas Murray Butler; Owen Wister; Herbert Adams; Augustus Thomas; Timothy Cole; Cass Gilbert; Robert Grant; Frederick MacMonnies; William Gillette; Paul Elmer More; Gari Melchers; Elihu Root; Brand Whitlock; Hamlin Garland; Paul Shorey; Charles Adams Platt; Archer Milton Huntington; Childre Hassam; David Jayne Hill; Lorado Taft; Booth Tarkington; Charles Dana Gibson; John Charles Van Dyke; Royal Cortissoz; Henry Hadley; Charles Downer Hazen; George Pierce Baker; Edwin Anderson Alderman; Edward Channing; Wilbur L. Cross; Hermon A. MacNeil; John Russell Pope; Edwin Arlington Robinson; James Earle Fraser; and John Huston Finley.

At a public meeting held on April 23, 1928, the Academy presented to Otis Skinner its

gold medal for good diction on the stage, which had been awarded by a ballot of the Academy.

The Directors elected in 1928 were: President, Nicholas Murray Butler; secretary, Robert Underwood Johnson; treasurer, Thomas Hastings; Herbert Adams, Wilbur L. Cross, Hamlin Garland, Cass Gilbert, Archer Milton Huntington, and Augustus Thomas. The headquarters are in the Academy building at 633 West 155th Street, New York.

ACADEMY OF SCIENCES. See NATIONAL ACADEMY OF SCIENCES.

ACCIDENTS. See RAILWAY ACCIDENTS; SAFETY AT SEA; WORKMEN'S COMPENSATION.

ACTINOMYCOSIS, äk'ti-nō-mī-kō'sis. This affection, while relatively rare, has recently come into prominence because the old treatment by surgery and iodide of potassium has been found inferior in the long run to the röntgen rays. Textbooks have for years stressed the older method of treatment as curative, but according to Desjardins of the Mayo Clinic the combination of surgical drainage and drugs has seldom cured a patient radically. During the period 1920-25 about thirty patients with this affection were treated at the Mayo Clinic and their cases are reported in *Radiology* for October, 1928. It is not to be understood that the older measures have been discarded for the contrary is the case; but the addition of the rays is sufficient to turn an unfavorable result to a favorable one. In stating that these patients are cured, this refers naturally only to the external location of the disease about the head and neck, which fortunately is much more commonly encountered than the internal location in the lungs, intestines, etc., where the outlook is bad. The X-rays are no new remedy for this condition for they have been on trial at least a quarter-century; but it is only recently that their importance has become recognized.

ADAMS, CYRUS CORNELIUS. American geographer, died at New York, May 4. He was born at Napierville, Ill., Jan. 7, 1849, and was graduated from the University of Chicago in 1876. While at the university he engaged in newspaper work. He removed to New York in 1884. His interest in foreign affairs led him into the study of geography, and he became one of the leading authorities in America on that subject. He was the first president of the department of geography of the Brooklyn Institute of Arts and Sciences, geographical writer for the *New York Sun* (1884-1906), editor of the *Bulletin* of the American Geographical Society (1908-15) and president of the American Society of Geographers, 1906. He wrote: *Commercial Geography for High Schools* (1901); *Elementary Commercial Geography* (1902); and *David Livingstone, African Development* (in *Beacon Lights of History*) (1902).

ADDISON'S DISEASE. This uniformly fatal although fortunately rare disease, which is characterized by low blood pressure, extreme weakness, brown discoloration of the skin, loss of appetite, extreme emaciation, etc., has long been known to be due to progressive destruction of the suprarenal glands with resulting shortage of the hormone known as adrenalin. In the great majority of cases this destruction is due to a local tuberculosis. Hardly any benefit can be claimed for organotherapy (suprarenal feeding), while the results of adrenalin injection are only temporary. It has often been suggested that healthy adrenal glands be grafted or im-

planted into the patient's body and this procedure is available because in the surgical removal of tuberculous kidneys it is possible to gain possession of a sufficient portion of healthy adrenal tissue. In the *Münchener medizinische Wochenschrift* for June 15, 1928, Dr. A. Reinhardt, a urological surgeon of Wiesbaden, announces the first operation of the kind and at the same time the first successful operation. The woman patient was in an advanced stage of Addison's disease and a piece of glandular substance was implanted in the abdominal wall. After several days a remarkable response was noted and six months later the patient was in fairly good condition with good appetite, a much improved blood pressure, return of the menses, etc. Doubtless the method will be tried out extensively.

ADELBERT COLLEGE. See WESTERN RESERVE UNIVERSITY.

ADELPHI COLLEGE. A non-sectarian college of arts and sciences for women, at Brooklyn, N. Y., incorporated in 1896. In the autumn of 1928 there were 626 students in the regular courses leading to the A.B. degree, distributed as follows: Seniors, 141; juniors, 149; sophomores, 185; and freshmen, 151. The summer session registration was 89 and the faculty numbered 44 in the autumn of 1928 and included the following additions: One professor in religion and Bible literature; one assistant professor in chemistry, and an assistant in physics. The income for the year was \$216,437. The library contained over 22,000 volumes. Three new buildings, under construction during the year on the new campus at Garden City, L. I., were to be completed by the autumn of 1929 in order that the college might be established there at that time. President, Frank Dickinson Blodgett, LL.D.

ADEN, a'den or a'den. A volcanic peninsula on the Arabian coast belonging to Great Britain: about 100 miles east of Bab-el-Mandeb. Area, 75 square miles; including the protectorate, about 9000 square miles. The settlement comprises also the peninsula of Little Aden, and some villages on the mainland, and the island of Perim, the last named having an area of 5 square miles. In 1921 the population of Aden and Perim was 54,923, of whom 80 per cent were Mohammedans. The population of the protectorate was about 100,000. The manufactures, which are unimportant, consist chiefly of salt and cigarettes.

As the principal commercial centre of the Arabian peninsula, Aden is the entrepôt for the Red Sea markets of Ethiopia, Eritrea, and Somaliland. It is also important as a fueling station, largely due to its position halfway between the Orient and Europe. The total imports during 1926-27 amounted to 88,060,903 rupees and the total exports for the same period to 69,540,118 rupees. The chief imports were cotton piece goods, grain, hides and skins, tobacco, coal, and provisions; the chief exports were coffee, gums, hides and skins, provisions, sugar, and tobacco. Most of the goods entering the foreign trade are transshipments. In the same year 1496 merchant vessels of 5,291,617 tons entered the port of Aden.

Attached to Aden are the Kuria Muria Islands off the Arabian coast, five in number, ceded by the Sultan of Muskat. Aden is under a British political resident with four assistants, the British Colonial Office having charge of all political questions and the British War Office

of military questions. The internal administration is in the hands of the Government of India. The gross revenue of the settlement in 1926-27 was 701,390 rupees. Political resident and General Officer Commanding in 1928, Maj. Gen. J. H. K. Stewart.

ADULT EDUCATION, AMERICAN ASSOCIATION FOR. An organization formed in 1926 to serve as a source of information concerning adult educational activities, and particularly to act as a clearing house through which the experience and findings of every adult educational enterprise may be made available to others. The Association seeks, also, to advise those who are already engaged in adult education, to aid those who are planning to initiate such work, to publish and secure the publication of material useful to those in the field, and to assist in studies of problems fundamental to adult education. It is the Association's view that adult education should count in its enrollment those men and women, young and old, who are no longer in contact with formalized education, whose primary interest lies in a vocation but who possess a secondary interest in their own educational improvement as a sustained and continuing process. Organizations directly concerned with adult education include libraries; universities and colleges, largely through their extension and other extra-mural departments; the public school system; chautauquas; open forums; people's colleges, labor schools; corporation schools; and numerous other agencies, including radio broadcasting, motion pictures, and newspapers. In rural communities and small towns, experiments have been made linking community organization with educational programmes, and in organizing and conducting classes with a traveling teacher, and various other experimental projects and studies were fostered by the Association in the urban field.

Toward the working out of teaching methods and subject matter for adult education, the Association has cooperated with the New School for Social Research, New York, in four teacher-training courses, and with the People's Institute of New York in experimental classes in various sections of Greater New York. *Adult Learning*, by Edward L. Thorndike and others, which was published during the year, embodies the results of experiments, conducted for the Association, to test the ability of adults to learn at various age levels. A study seeking to determine the influences which account for the formation of reading habits, desirable or otherwise, was undertaken, at the instance of the Association, by a committee of which Dean Gray of the College of Education, University of Chicago, was chairman. Other special studies undertaken were concerned with prison educational programmes, correspondence school methods, and collegiate alumni educational programmes. Membership in the Association is open to individuals or groups interested in adult education. It depends for its financial support upon dues from members, upon the interest of private individuals, and of educational foundations. The national conference in May, 1928, was held at Swarthmore College, Swarthmore, Pa. The officers elected in 1928 were: President, Dean Emeritus James E. Russell, Teachers College, Columbia University; vice president, Prof. Leon J. Richardson, University of California; treasurer, J. H. Puelicher, American

Bankers' Association, Milwaukee; secretary, Miss Margaret Burton, National Board of the Young Women's Christian Association, New York; executive director, Morse A. Cartwright, New York. The foregoing with fourteen other members composed the executive board of the Association. National headquarters are at 41 East 42nd Street, New York.

ADVANCEMENT OF SCIENCE. AMERICAN ASSOCIATION FOR THE. Founded in 1848 to advance science, to give a stronger and more general impulse and more systematic direction to scientific research, and to procure for the labors of scientific men increased facilities and a wider usefulness. In 1928 its membership included over 17,300 individuals interested in the advancement of science and the progress of knowledge and education, 118 autonomous and independent associated scientific societies of which 87 were officially affiliated with the Association, 23 being local academies of science. The direction of the Association rests in a council consisting of the officers, representatives of the affiliated societies and academies, and eight members elected at large by the council. It holds an annual meeting at the same time as the Association and operates in the interim through an executive committee. The activities of the Association are of three kinds: Those related to the holding of the annual and other meetings; those related to publications; and those related to the advance of knowledge by research. It has 15 sections representing the main current subdivisions of science, as follows: Mathematics, physics, chemistry, astronomy, psychology, social and economic sciences, historical and philological sciences, anthropology, geology, zoölogical sciences, botanical sciences, engineering, medical science, agriculture, and education.

The official organ of the Association is a weekly journal, *Science*, which furnishes an open forum for the discussion of questions regarding science and education, almost every branch of scientific knowledge being represented in its columns. In addition the Association issues an elaborate programme for each annual meeting, and it publishes at four-year intervals a volume of *Summarized Proceedings*, including a directory of members. The permanent endowment of the Association, the income from which is employed to advance scientific research, amounted in 1928 to \$150,095.66; grants are made annually to individuals or scientific organizations to promote research. Two regional divisions are conducted by the Association: The Pacific Division, including the Pacific States, Alaska, the Philippines, and the Hawaiian Islands, and the Southwestern Division, including Arizona, New Mexico, Colorado, western Texas, and northern Mexico. These divisions are autonomous, holding annual and other meetings and engaging in other projects in their respective fields.

The eighty-fifth meeting of the association was held at New York City, Dec. 27, 1928, to Jan. 2, 1929, with an attendance of about 5000, this being the largest meeting ever held. Forty-six independent societies met with the association and there were about 250 sessions, at which about 2200 papers and addresses were given by about 1900 persons. The science exhibition was well developed, with exhibits by commercial firms, individuals, and scientific organizations. Henry Fairfield Osborn, president of the American Museum of Natural History, eminent palæontol-

ogist and educator, was president. The president elected for 1929 was Robert A. Millikan, eminent physicist, director of the Norman Bridge Physical Laboratory of the California Institute of Technology, at Pasadena. The annual association prize of \$1000 was awarded to Dr. Oliver Kamm, of Parke, Davis & Co., Detroit, for his paper, "Hormones from the Pituitary Gland," abstracted in *Science* for Jan. 25, 1929. Information about the association may be obtained by addressing the office of the permanent secretary, Dr. Burton E. Livingston, which is in the Smithsonian Institution Building, Washington, D. C. The 1929 meeting of the Association was arranged for Des Moines, Iowa, from Dec. 27, 1929, to Jan. 2, 1930.

ADVANCEMENT OF SCIENCE, ASSOCIATIONS FOR. The eighty-fifth annual meeting of the American Association for the Advancement of Science (q.v.) was held in New York City, December 26 to 31, 1928, with about 45 affiliated societies. The Southwestern division of the American Association for the Advancement of Science met at Flagstaff, Ariz., April 23 to 26. The Pacific division met at Claremont, Calif., June 13-16, 1928. The British Association for the Advancement of Science (q.v.) met at Glasgow, September 5 to 12; the French Association, at Le-Rochelle, July 23 to 28, and the Swiss Society of Natural Sciences, at Lausanne, August 30 to September 24.

ADVENT CHRISTIANS. See ADVENTISTS.

ADVENTISTS. The Advent Movement had its origin in America with William Miller, who believed not only in the coming of Christ in person, power, and glory, but that such an advent was at hand and that the date might be fixed with some definiteness. The movement, however, began in England and on the Continent, under the leadership of the Rev. Hugh McNeile and the Rev. Edward Irving, in England, and the Rev. Joseph Wolfe, DD., LL.D., in Prussia. A Prophetic Conference was held at Albany Park in 1836, at the residence of Henry Drummond, Esq., afterwards a member of the British Parliament, with "Eight days of serious study of the prophecies," at which the Rev. Hugh McNeile presided. The first general gathering in America of those interested took place in Boston, October, 1840, the movement at that time being wholly within the existing churches, but in April, 1845, a conference was held at Albany, N. Y., at which the adherents of the Adventist doctrine were organized and a declaration of principles adopted, embodying the views of Mr. Miller. For the next ten years this organization included practically all the Adventists, but gradually separate bodies developed, beginning with the Advent Christian Church, in 1855, and including the Seventh-Day Adventists, organized in 1860; Life and Advent Union, in 1864; The Church of God (Adventists), in 1866; and The Churches of God and Christ Jesus, in 1888.

ADVENT CHRISTIAN CHURCH. This church, which is congregational in church government, holds simply to the general imminence of Christ's return but takes the position that the day cannot be determined. It holds a biennial general conference, the 1928 meeting being held at Dowling Park, Florida, June 17-24. Statistics for 1927, covering 44 conferences, showed 447 churches; 541 ordained ministers; 106 licensed ministers; 26,237 church members; 306 Sunday schools; 20,600 Sunday-school members; 121 Young People's Societies of Loyal Workers, with

4307 members. Eighteen conferences are not included in these totals. The denomination maintains four publication societies and two educational institutions, Aurora College of Aurora, Ill., and the New England School of Theology in Boston. Periodicals published include the *World's Crisis* (Boston), *Messiah's Advocate* (Oakland, Calif.), *Our Hope* (Mendota, Ill.), and *Present Truth Messenger* (Live Oak, Fla.). Among the philanthropic institutions of the denomination are the American Advent Christian Home and Orphanage at Dowling Park, Fla., and the Vernon Home for ministers and missionaries at South Vernon, Mass. The Rev. J. William Denton was general director in charge of the headquarters at 160 Warren Street, Boston 19, Mass.

SEVENTH-DAY ADVENTISTS. The largest denomination of the Adventist group, embracing 12 union conferences in the United States and Canada. This denomination believes that the seventh day of the week, from sunset on Friday to sunset on Saturday, is the Sabbath established by God's law and that immersion is the only proper form of baptism. The local church is congregational in government, although under the general supervision of the conference. The statistical report of the denomination for 1927 indicated 2222 churches in the North American Division, 850 ordained ministers, and 112,276 church members. Sabbath schools numbered 2775 and the membership, 119,557. Figures for the foreign division were 3765 churches; 924 ordained ministers; 161,788 church members; and 5727 Sabbath schools, with an enrollment of 204,435. The movement maintained, in the United States and Canada, 67 educational institutions, which in 1927 had 13,559 students enrolled. Of the colleges and seminaries, Loma Linda Medical College, Calif., and Pacific Union College, St. Helena, Calif., were the largest. There were also 78 educational institutions maintained in foreign countries. The denomination had 18 publishing houses in North America, and 38 in foreign countries; denominational literature was issued in 132 languages; and evangelistic work was conducted in 127 countries. Periodicals of the movement included: *Advent Review and Sabbath Herald* (Washington); *Signs of the Times* (Mountain View, Calif.); and *Watchman* (Nashville, Tenn.).

AERONAUTICS. The year 1928, marking as it did the twenty-fifth anniversary of successful flight of a heavier-than-air machine, was a year of progress and development in all fields of aeronautical activity. More and more was the interest of the public aroused in aerial transportation and the facilities offered for the transport of persons, mail, and freight were being utilized to an ever-increasing degree. Technical developments were to be noticed on a proportionate scale, while the year's record of notable flights was replete with trips that showed greater range and reliability for airplanes as well as the operation of dirigibles under unusual conditions.

Observing the usual arrangement of the YEAR BOOK, some of the more significant developments of the year 1928 are recorded in the following paragraphs:

BALLOONS

NATIONAL ELIMINATION BALLOON RACE. This competition for 1928 was started at Bettis Field, Pittsburgh, Pa. on May 30, with a field of 14 entrants and was won by Capt. W. E. Kepner in the balloon, *Army No. 1*, landing 1 mile north of Weems, Va., a distance of 261½ miles. The National Balloon Race for 1928 was hardly as successful as in previous years, and in fact the distance accomplished was the shortest recorded in the history of this competition which began in 1909. The previous low record was made in 1914 by R. A. D. Preston, who landed 301 miles from the starting point at St. Louis. The reason for the short flights was a sudden thunderstorm area which developing quickly brought 11 of the 14 competing balloons to the ground in the vicinity of Pittsburgh within approximately three hours, leaving but 3 to accomplish substantial distances as indicated by the accompanying tabulation. The storm resulted in a series of casualties, Lieut. Paul Evert, pilot of the *Army No. 5* and Walter W. Morton, aid to W. T. Van Orman in *Goodyear No. 5*, being killed; while Van Orman suffered a fractured leg and James F. Cooper, an aid on the *City of Cleveland* piloted by C. K. Wollan, was severely bruised. The pilot jumped and landed safely with his parachute. The record for the 14 starters with their standing is given herewith.

Place Entry	Pilot and Aid	Place of Landing	Distance miles
1. Scott Field	Capt. W. E. Kepner	1 mi. N. Weems, Va., 22 mi. W. Irvington, Va.	261½
2. C. A. Palmer	Lt. Wm. O. Eareckson	4 mi. E. SSE Cumor, Va.	248
3. Detroit Balloon Club	C. A. Palmer		
	J. W. Mell	3 mi. W. Widewater, Va.	187½
4. Detroit Balloon Club	W. C. Naylor		
	Russell Wherritt	3½ mi. E. Connellsville, Pa.	30½
5. NAS Lakehurst, N. J.	G. M. LeGallee	1½ mi. S. Perryopolis, Pa.	21½
	W. A. Kilgoff		
6. Langley Field, Va.	Lt. T. G. W. Settle	Foxdale, Pa. 1 mi. S. Youngwood, Pa.	18¾
	Lt. Paul Evert		
7. Goodyear Tire & Rubber Co.	Lt. U. G. Ent	Youngwood, Pa.	17¾
	W. T. Van Orman		
8. Cleveland Chamber of Commerce	W. W. Morton	Christy Park near Youngwood, Pa. W. Newton Road	14¼
	C. K. Wollan	3 mi. E. Irwin, Pa.	12¾

14. Sun Telegraph	Lt. Geo. F. Watson		
	W. G. Bennett		
	Walter Chambers		

THE GORDON BENNETT INTERNATIONAL BALLOON RACE. The Gordon Bennett 1928 Balloon Race was won by Captain W. E. Kepner, U. S. Army, who piloted the Army balloon which landed July 1 following its ascent on June 30 at Detroit. As this was the third consecutive victory this trophy became the permanent property of the United States. There were 12 contestants representing 7 different nations who went aloft on June 30, with adverse weather conditions, and as a result the record of the winner, Captain Kepner, who landed at Kenbridge, Va., a distance of 460.9 miles, was considerably less than 1927 record of 800 miles. The competition, however, was close as the German balloon, *Barmen*, piloted by Hugo Kaulen, landed at Chase City, Va., a distance of 459.4 miles, and the French balloon, *Blanchard*, piloted by Capt. Charles Dollfus, was third, with a distance of 447.9 miles. Of the other contestants, four landed in West Virginia in mountainous country, these being *The Detroit*, piloted by William C. Naylor who landed at Cass, West Virginia; the Belgian balloon, *Wallonie*, piloted by Joseph Thonnard, which landed at Beverly, W. Va.; the German balloon, *Brandenburg*, piloted by Otto Bertram, which landed at Davis, W. Va.; and the Swiss balloon, *Helvetia*, piloted by E. L. Maag, which landed near South Worthington, W. Va. The other competitors included a Danish balloon, *Denmark*, S. A. M. Rasmussen, pilot, which landed at Roanoke, Va.; an American balloon, *American Business Club*, from Akron, Ohio, C. A. Palmer, pilot, which also landed at Roanoke, Va.; an Argentine balloon, *Argentine*, with Eduardo Bradley, pilot, which landed at Millboro, Va.; a French balloon, *Lafayette*, George Blanch, pilot, which landed near Bulay, Va., and a German balloon, *Munster*, F. Eimermacher, pilot, which landed near Big Roland, W. Va.

AIRSHIPS

NEW UNITED STATES NAVY AIRSHIPS. On Oct. 5, 1928, the United States Navy Department awarded to the Goodyear-Zeppelin Corporation of Akron, Ohio, a contract for the construction of two rigid airships at a total cost of \$7,825,000; one to cost \$5,375,000 and the other to cost \$2,450,000. These new dirigibles were to be known as the *ZRS-4* and the *ZRS-5*, and were to be built with hulls of duralumin longitudinal and transverse girders and steel wire bracing. These girders were to be of a new design with greater strength and efficiency than any hitherto used. The engines and the engineers were to be housed within the hull doing away with external cars to contain the motors, so that the air resistance of the craft would be reduced and its safety increased, as it was found in the wreck of the *Shenandoah* that no one who remained in the hull suffered any injury. The propellers were to be supported on brackets from the hull and were to be driven from the engines through transverse shafts and bevel gears. The propeller axes were so arranged that they could be turned into the vertical position so as to exert up or down thrust to aid in the taking-off or landing of the airship.

The outside of the hull was to be covered with aluminized fabric stretched smooth and tight; while there would be 11 separate cells of gas-tight fabric containing the helium gas used for buoyancy, affording a nominal gas volume of 6,500,000 cubic feet. The new airships were to be

fuller and less slender than the *Los Angeles*, designed in 1922, and would have a range of operation $2\frac{1}{2}$ times greater than that craft. The hull would be of sufficient strength for storm or squall conditions approximately twice as severe as the *Los Angeles* could encounter with success. There would be provided three longitudinal corridors and passageways completely around the circumference of each main transverse frame, affording opportunity of access and inspection at all parts of the ship. Such facilities were provided so as to make possible the execution of repairs in flight. Another notable feature of the two airships would be provision for housing airplanes in special hangars within the hull so that they could be launched while the dirigible was in flight.

PRINCIPAL CHARACTERISTICS OF THE LOS ANGELES AND THE ZRS-4

	<i>Los Angeles</i>	<i>ZRS-4</i>
Nominal gas volume, cu. ft.	2,470,000	6,500,000
Length overall, ft.	658.3	785
Maximum diameter, ft.	90.7	132.9
Height overall, ft.	104.4	146.5
Gross lift, lb.	153,000	403,000
Useful lift, lb.	60,000	182,000
Number of engines	5	8
Total horse power	2,000	4,480
Maximum speed, knots	63.5	72.8
Range without refueling at 50 knots cruising speed, nautical miles	3,500	9,180

BRITISH AIRSHIPS. In Great Britain active progress was being made during the year on two dirigibles of 500,000,000 cubic feet capacity. The State airship, *R-101*, was under construction at the Royal Airship Works at Cardington, where was to be located the home station of the British Empire Air Service, and the *R-100* was being built by the Airship Guarantee Company at Howden. The *R-101* is designed to accommodate 100 passengers and to have a lifting force up to 150 tons. She is to have a range in still air with the ordinary commercial load of 4000 miles at a cruising speed of 63 miles per hour with a minimum speed under the specifications of 70 miles an hour at an altitude of 5000 feet. The length of the airship is 724 feet. The passenger accommodations are arranged on two floors stretching over two bays of the ship, with an area of 5550 square feet on the upper deck exclusive of the promenades, but including a large single lounge. The ship carries a dining room for 50 passengers and on the deck below is a smoking room, while two-berth sleeping cabins are located on both decks. A long covered corridor connects the passengers' quarters with the nose of the ship and steam radiators are employed to warm the quarters of the passengers.

The *R-101* has engines using a heavier fuel instead of gasoline as hitherto, and employs the ordinary commercial fuel oil that was used in the 650-horse-power Beardmore Tornado engines. Five of these units are employed driving air screws with blades of variable pitch, which also can be reversed and set to a neutral pitch. An auxiliary engine using gasoline is required to start the main engine in each car to drive the air compressor and to generate electric current until the air screw operated dynamo is at work under the influence of the air stream.

The *R-100* differs from the *R-101* in that she has the more usual type of gasoline engines. It was anticipated that both ships would be available for tests early in 1929 and a demonstration

P. & A. Photo

TRANSATLANTIC FLIGHT OF THE GERMAN AIRSHIP "GRAF ZEPPELIN"
OVER PERTH AMBOY, N. J.

OCTOBER 15, 1928

flight to America was contemplated for the *R-100*. Five mooring towers and sheds had been designed at various points throughout the British Empire and it was planned to establish complete service throughout its wide extent.

TRANSATLANTIC FLIGHT OF THE GRAF ZEPPELIN. One of the notable events of the year was the successful transatlantic crossing of the German dirigible, *Graf Zeppelin* (LZ-127) which leaving Friedrichshafen October 11 arrived in the United States in 111 hours and 38 minutes after a trip of approximately 6300 miles. Leaving Friedrichshafen at 2 A. M. on the morning of October 11, the great dirigible headed southwest over France and Spain and passed Gibraltar at approximately midnight, and then laying a westerly course across the Atlantic the airship flew over Funchal, Madeira Islands, and passed the Azores in the afternoon of October 12. From here a course was laid to Bermuda, and near this island on October 13 a severe storm was encountered in which a portion of the fabric of the lower surface of the port fin, as well as a portion of the upper surface, was ripped by the heavy wind pressure. This mishap impaired the stability of the airship and required temporary repairs by four members of the crew who climbed out on the metal spars and removed or made fast the flapping fabric.

Careful navigation was required to avoid further storms and speed was materially reduced, the ship being affected seriously by the inefficiency of the stabilizer on the port side. Progress was slow on October 14, but on the following day, when at 6 P. M. the airship passed over Bermuda, with better atmospheric conditions the Virginia coast was reached and the *Graf Zeppelin* flew over Washington, Baltimore, and Philadelphia, proceeded to New York where she turned and then finished the long journey at the Lakehurst, N. J., mooring mast. On the following day as the wind died down, the *Graf Zeppelin* was placed in the hangar alongside the United States Navy dirigible, *Los Angeles*.

The reception of the Zeppelin on reaching the coast of the United States and at its picturesque passage over the Eastern States was enthusiastic in the extreme. Dr. Hugo Eckener, the designer of the ship, who also had brought over the *Los Angeles* from Germany, was commander and with him were, E. A. Lehmann, first officer; H. C. Fleming, second officer; Wilhelm Siegle, chief engineer; and E. von Schiller, Anton Wittemann, Max Pruess, and Walter Scherz, navigators. The crew numbered 40. Lieutenant-Commander Charles Rosendahl, U. S. N., who was the commander of the *Los Angeles*, made the journey as a guest and observer. Twenty passengers, one of whom was a woman, were carried.

The *Graf Zeppelin* after making repairs at the Navy hangar at Lakehurst, N. J., arranged for an extensive trip through the Middle West, passing over the more important cities, but unfavorable weather conditions interfered so that this was abandoned, and after refuelling with ethane gas made by distilling off the heavier constituents of natural gas at Winchester, Ky., the ship departed at 1.45 A. M., October 29, on its eastward return trip, taking a course slightly south of the great circle route, but close to the steamship lanes. Sixty-four persons, 48 bags of mail, and 341 pounds of freight were carried and while rough weather at first was

encountered the flight from Lakehurst to Friedrichshafen was made in 71 hours and 10 minutes which was a better record than that made by the British dirigible, *R-34*, when it flew from Roosevelt Field to England in 75 hours, in 1919.

The *Graf Zeppelin* encountered a severe storm off Newfoundland during the first day which continued during the night, the wind at times having a velocity as great as 88 miles per hour driving the ship backwards. Bad weather was also encountered in the Bay of Biscay and fog and clouds over western Europe. However, the return trip was made successfully and the experience of Dr. Eckener and his crew added materially to the available knowledge of long flights of dirigibles.

While the westward trip was neither the first nor by any means the fastest transatlantic trip for a large dirigible, yet on account of the stress of unfavorable conditions it was in many respects more valuable than other voyages more auspiciously carried on. A new world's record was made for duration in the air for both heavier and lighter than air craft, and naturally the flight of the *Graf Zeppelin* was compared with that of the British dirigible, *R-34*, made in July, 1919, from East Fortune, Scotland, to Mineola, N. Y., 3130 miles in 108 hours; and that of the *Los Angeles* which flew from Friedrichshafen to the United States in 1924. The *R-34* returned to England without mishap, while the *Los Angeles* cruised extensively over the United States in the service of the Navy Department.

The *Graf Zeppelin*, the general plans of which have been described in earlier YEAR BOOKS, was the 117th rigid type dirigible to be built by the Zeppelin Corporation at Friedrichshafen, Germany, and with an overall length of 778 feet and a maximum diameter of 100 feet was the largest dirigible to be constructed up to that time. The total weight of the craft was 121 tons and the gross lift 107 tons. It carried fuel for 6200 miles and with a crew of 26 men it afforded space for a pay load of 15 tons. In the test flights which were carried on during September and October from Friedrichshafen, a maximum speed of 80 miles per hour and a cruising speed of 73 miles per hour was demonstrated.

The hull in its general design resembled the *Los Angeles* of the United States Navy, being thicker and blunter than the earlier Zeppelins, though of streamline form. The main frames consisted of 28-sided polygons made of duralumin, spaced 49 feet apart with two auxiliary frames between each of the main frames. The frames were braced by wire and trusses. The frame and the longitudinal girders were triangular in section with circular section booms replacing the open angle sections which previously had figured in the Zeppelin design. There was a keel-framing system which reinforced the bottom sides of each polygonal frame. The navigation and control cabins together with accommodations for passengers were provided in the main, or forward, gondola rigidly attached to the keel framing with its forward part brought into the upward curve of the hull; while its bottom was so designed as to make an easy curve with the hull proper.

In the forward part of the main gondola was the control room with telegraph and other communications with the engine gondolas and other parts of the ship. Adjoining the control room

was the chart or navigation room and behind this was the radio room on one side and the galley on the other. Next came the passenger saloon and dining room, luxuriously furnished, and still further aft opening on a central corridor were 10 double-berthed sleeping compartments with lavatories. A passage led to the crew's quarters and the storage space for supplies, mail, and baggage inside the keel framing of the hull. Along the keel framing a main gangway was provided from bow to stern with branch galleries affording access to the engine gondolas. The hull of the ship is traversed by a second fore-and-aft gangway located just below the longitudinal axis to which access is given to the 30 gas bags or ballonets. Sixteen of these contain 3,710,000 cubic feet of hydrogen gas used for buoyancy, while the remainder carried the blau gas employed for fuel.

This gas is a hydrocarbon product with a specific gravity ranging from 1.04 to 1.08, developed by Herman Blau of Augsburg, Germany, and was employed on account of its low specific gravity as preferable to liquid fuel where a variation in weight due to consumption requires the release of hydrogen in order to maintain the equilibrium of the airship. Here as the gas is consumed it is replaced by air so that the variation in the gross weight of the craft need not be considered. It is obtained by an oil-cracking process and has a heat content of about 1800 B.t.u. per cubic foot. Its specific gravity is 1.08 compared with air. Power was supplied by 5 Maybach-Zeppelin VL-2, 12-cylinder, water-cooled, V-type engines each of 550 horse power, placed in individual gondolas two pair abreast beneath the hull amidships, and one along the keel near the stern. The weight of each engine was 2450 pounds, or greater per horse power than an airplane engine, but as designed they were more economical in fuel consumption. The placing of the engines was so planned that there was no interference in the separate slip streams. Each engine could be directly reversed by the simple shifting of the cam shaft.

In place of large quantities of water ballast ordinarily used in airships which could be released to compensate for diminished buoyancy, the *Graf Zeppelin* carried approximately eight times the gasoline which was used for fuel in order to decrease the weight. The general specifications of the *Graf Zeppelin* were stated as follows:

Overall length	778 ft.
Maximum diameter	100 ft.
Maximum height	111 ft.
Form ratio	7.7
Displacement	3,710,000 cu. ft.
Maximum speed	80 m. p. h.
Cruising speed	73 m. p. h.
Power plant (5 Maybach VL-2 engines)	2,750 h.p.
Cruising range	7,000 mi.
Crew (normal)	30
Passenger capacity	20
Gross lift	107 tons
Designed pay load	15 tons

AIRSHIP ITALIA. Another attempt at Arctic exploration with a dirigible occurred during the year when Gen. Umberto Nobile made a successful flight over the North Pole on May 24, but was forced down on May 25 when the airship encountered a gale of snow and wind. The crash occurred less than five miles off Foyn

Island north of Spitsbergen at 80.30 degrees north and 28 degrees east. The *Italia* left Stolt, Germany, at 3.23 p.m. on May 3 and arrived at Vadsoe, North Norway, on May 4, in the course of which the envelop was torn and the machinery damaged. On May 5 the *Italia* landed at Kings Bay, Spitsbergen, where several days were spent in repairs. On May 11 at 7.48 A.M. a flight was made from this base, but lasted only 8 hours on account of dense fogs and heavy winds so that after an eight-hour trip the ship returned to its station. On May 15 in the afternoon, the *Italia* started and progressed through unexplored regions of the Arctic, notwithstanding that fog was encountered and ice formed on the sides of the dirigible. On May 16 Franz Josef Land was left behind and the *Italia* headed toward Lenin Land, crossing the Polar Sea and after sighting Cape Nicholas and making a thorough exploration, a return was made to King's Bay. Here activity was suspended on account of adverse winds until May 23, when at 4.40 in the morning the *Italia* set out and the following day crossed over the North Pole at 1.20 A.M. after a flight of 750 miles from King's Bay, reporting its position and its passage over the pole by radio. The ship then headed south for Spitsbergen, but the following day, Friday, May 25, radio reports ceased and it was feared that the airship had been forced down on the ice. The *Citta di Milano*, Nobile's relief ship, planned to start north, but a call was sent out from the wrecked expedition. Various means of relief were organized as discussed under POLAR RESEARCH. Late in the year was published *Tragedy of the Italia* by Davide Giudici.

NOTABLE FLIGHTS

LINDBERGH'S CENTRAL AMERICAN FLIGHT. The notable good-will flight of Col. Charles E. Lindbergh in his *Spirit of St. Louis* which had begun in December of 1927 continued during the following year and on January 1 the distinguished aviator left Belize, British Honduras, for San Salvador. Staying here until January 3 he proceeded on a rather rough trip to Honduras and on January 5 continued to Managua, the capital of Nicaragua. Costa Rica was reached on January 7, where a notable reception was given to the American aviator, and two days later he flew to Panama where the field on which he landed was named for him. On January 12 Colonel Lindbergh proceeded to Colon in the Canal Zone, being received by the airplanes of the U. S. Army having their headquarters at France Field. He remained in the Canal Zone until January 26, on account of a change in his plans, and then proceeded to Cartagena in Colombia in response to the invitation from that State and from Venezuela. On January 27, he flew to Bogota where again he was the recipient of notable attention both official and popular, and two days later he proceeded to Maracay, Venezuela. From Maracay to St. Thomas in the Virgin Islands was the next stage in his journey and was about 1000 miles, being the longest flight he had attempted after leaving Washington. This port was reached successfully and on February 2, he proceeded to Porto Rico and two days later to Santo Domingo where he visited the historic places connected with the memory of Christopher Columbus. On February 6 he flew to Port-au-Prince in Haiti, and on February 8 he made a flight of nearly

900 miles to Havana where once more he received a most enthusiastic welcome and the highest official honors. Leaving Havana on February 13 early in the morning, he passed over Florida and reached his destination at St. Louis, Mo., that same evening. Colonel Lindbergh made 16 stops on this flight of 9060 miles and was 116 hours and 30 minutes in the air.

It was interesting in this connection that Colonel Lindbergh reported on February 6 when landing at Port-au-Prince that the *Spirit of St. Louis* had at that time been in the air more than 459 hours covering 40,000 miles in 467 flights. There had been no replacement of the original motor, which at that time had not received a major overhauling, and neither plane nor engine had over 5 per cent replacements. Colonel Lindbergh reported further that both plane and engine were in excellent condition, capable of much longer service and he expressed as his opinion that a modern plane and engine under appropriate conditions of care and maintenance should have a minimum life of 150,000 miles. The *Spirit of St. Louis* was deposited in the Smithsonian Institution, and Colonel Lindbergh was awarded during the year the Congressional Medal of Honor, a special medal voted by Congress, the Woodrow Wilson Peace Award—a medal and \$25,000—the International Aeronautical Federation's Gold Medal for the greatest achievement in aviation in 1927, and the Harmon Trophy of the International League of Aviators.

COSTES-LEBRUX FLIGHT. This notable flight by Capt. Dieudonne Costes and Lieutenant-Commander Joseph Lebrux, two French aviators, referred to in the 1927 YEAR BOOK, at the close of that year had reached Lima, Peru, in the course of an extended tour that began on October 10 from Le Bourget Airport, Paris. On Jan. 11, 1928, these French aviators proceeded to Guayaquil, Ecuador, and at Panama City on January 13 they met Colonel Lindbergh on the good-will flight referred to above. Costes and Lebrux on January 16, then proceeded to Caracas, Venezuela, and on January 21, to Baranquilla, Colombia, returning on January 24 to Colon Guatemala City on January 26, Mexico City on January 29, and New Orleans on February 4 were the next stops on this memorable trip, the 1100 miles from Mexico City to New Orleans being flown in 10 hours and 8 minutes. Montgomery, Alabama, was reached on February 6 and on February 8 they left for Washington in heavy weather, losing the escort of United States Army planes, but finding their way to Bolling Field where they were greeted by President Coolidge and many government officials. On February 11 they flew from Washington to Mitchel Field and on March 2 they started across the continent, but were forced down at Sharon, Pa. From this point their trip to San Francisco with incidental stops was successful, and they sailed from that port for Tokyo on the steamship, *Korea Maru*. Flying from Tokyo on April 8 they continued their flight and reached Paris on April 14, where they had an enthusiastic reception and official honors.

HINKLER'S FLIGHT. On February 7, Capt. Herbert John Louis Hinkler in an Avro Avian light plane left Croydon Airport, England, for a flight of 12,000 miles to Port Darwin, Australia, which he accomplished in 16 days, with actual flight time of 134 hours and an average speed of from 90 to 100 miles per hour, cutting the

flight record between England and Australia by 12 days and making the fastest trip from England to India, as well as the first non-stop flight from London to Rome. The stops and distances made on this notable trip were as follows: Rome—900 miles, Malta—420 miles, Tebrock—650 miles, Ramleh—650 miles, Basra—800 miles, Jask—700 miles, Karachi—600 miles, Cawnpore—600 miles, Calcutta—600 miles, Rangoon—750 miles, Burma—450 miles, Singapore—750 miles, Bandoeng—600 miles, Bima—850 miles, and Port Darwin—970 miles. Hinkler's flight was the longest solo flight to be made and also the longest flight ever made in a light plane, the almost 1000 miles across the open water of the Tasman Sea being a notable achievement for a small plane of the so-called "flivver" type.

EUROPE TO AMERICA FLIGHT OF THE BREMEN. On Apr. 13, 1928, the Junkers monoplane, *Bremen*, with Capt. Hermann Koehl and Commandant James Fitzmaurice, Chief of the Irish Free State Air Force, as co-pilot, and a passenger, Baron Gunther von Huenefeld who had furnished the financial support of the expedition, was forced down on Greenely Island in the Straits of Belle Isle off the coast of Labrador after the first flight by an airplane from Europe to America. The *Bremen* left Germany on March 26 at 8.20 A.M. and flew to the Baldonnell Airdrome at Dublin, Ireland, where it arrived at 4.30 P.M. after a flight of 9 hours and 35 minutes duration. Here bad weather interfered with immediate progress westward, so that it was April 12 before the Junkers machine was able to resume its flight. The *Bremen* was sighted at 7.05 A.M. over Costello, Galway, and from that time was not reported until it was forced down on Greenely Island, 400 miles off its course after flying 36½ hours, on account of shortage of fuel, an airline distance of 2125 miles. The trip was planned to terminate at Mitchel Field, Long Island, N. Y., and aroused extraordinary interest on two continents, as nothing was heard of the aviators until after their forced landing. They were relieved by a Canadian plane on April 15. In making the landing the Junkers monoplane was damaged, but it was hoped that repairs could be made with spare parts shipped by an American plane.

One of the relief planes sent for this purpose started from Detroit on April 20 piloted by Floyd Bennett and Bernt Balchen. It was a trimotored Ford plane that had been under test in snow storms and other conditions likely to be encountered in the far north in preparation for an antarctic trip. Both pilots started while ill, and, at Murray Bay, Bennett was compelled to give up and was hurried to a hospital in Quebec with pneumonia from which he failed to recover. A notable trip was made by Col. Charles A. Lindbergh on April 24 to carry a pneumonia serum, but it was in vain and the distinguished aviator died on the morning of April 25. (See BENNETT, FLOYD.) The German-American fliers in another plane reached Curtis Field at one o'clock on April 27 and after attending Bennett's funeral in Washington returned to New York for an elaborate reception which was given them on April 30 and May 1. Later they made a tour of the United States by airplane.

TRANS-PACIFIC FLIGHT. One of the most notable flights of the year was that of the *Southern Cross* a tri-motored Fokker monoplane with whirlwind engines, the sister ship of Commander Byrd's Arctic airplane, which left Oakland, Cali-

fornia, on May 31 at 8.51 A.M. and reached Honolulu June 1 at 9.49 A.M. Hawaiian time, continuing on June 3 at 5.20 A.M. for Fiji where it arrived at Suva on June 5 at 6.23 P.M. On June 8 the *Southern Cross* left Fiji at 2.52 P.M. and accomplished the 1762 miles to Brisbane, Australia, in 21 hours, 18 minutes, marking the completion of the trans-oceanic flight which, however, was continued as far as Sydney. The *Southern Cross* was piloted by Capt. Charles J. Kingsford-Smith, commander and pilot, with Capt. Charles T. P. Ulm, relief pilot, both Australians, with two Americans, Harry W. Lyon, navigator, and James W. Warner, radio operator. The flying time from Oakland Airport, Calif. to Honolulu, a distance of 2400 miles, was 27 hours and 28 minutes; while the 3200 miles, the longest over-water flight so far attempted, from Honolulu at Fiji, was made in 34 hours and 33 minutes, the 1762 miles to Brisbane, Australia, in 21 hours and 18 minutes. The fourth leg of 500 miles brought the *Southern Cross* to Sydney, and the last flight to Melbourne, the whole requiring a total of some 88 hours flying time for 7800 miles. The *Southern Cross* and its crew received a notable reception in Australia. This trip while it broke no world record was notable for the accuracy of the navigation and for the fact that the radio operator was constantly in communication with either shore stations or ships throughout the flight.

WILKINS ARCTIC FLIGHT. Capt. George Hubert Wilkins who had made many systematic explorations in the Polar Regions, in company with Lieut. Carl Ben Elson made a notable flight of 2100 miles from Point Barrow, Alaska, to Spitsbergen on April 21. The plane employed was a Vega-Lockheed monoplane with wasp engine which was transported by sea and rail to Fairbanks, Alaska. A flight of 500 miles was made from Point Barrow where the trip proper began two days later. This flight was made to demonstrate the superiority of the airplane over the dirigible in Arctic exploration, and continued the systematic work of Captain Wilkins in this region. He made copious notes both geographical and meteorological, and by a number of geographers it was believed that across the Arctic was the shortest and best air route to the Far East. After arriving at Spitsbergen, Captain Wilkins announced to the world the successful outcome of his flight and he and his companion received many honors. See POLAR RESEARCH.

AMELIA EARHART'S FLIGHT. The first aerial crossing of the Atlantic by a woman was accomplished when Amelia Earhart flew from Trepassey, Newfoundland, on June 17 in the trimotored monoplane, *Friendship*, reaching the coast of Wales in 20 hours and 40 minutes. Miss Earhart flew from Boston Harbor on June 3 for Newfoundland, accompanied by Wilmer Stultz, pilot and radio operator, and Louis E. Gordon, mechanic. The *Friendship* was a multiple-engine sea-plane constructed according to specifications prepared by Commander Richard E. Byrd, who was consulted by Miss Earhart in regard to her trip. A wait of 14 days was compelled at Trepassey on account of unfavorable weather, though a number of attempts were made to start which were unsuccessful on account of the heavily laden airplane. Reducing the weight to only sufficient fuel for the trip and a small margin for safety, or about 700 gallons in all, the *Friendship* left on June 17 for Valencia, Ireland. Notwithstanding wind, rain, and snow, the flight was ac-

complished successfully although Stultz, the pilot, went beyond his original destination in Ireland and landed the plane after 2000 miles of flight off Burryport, Carmarthenshire, Wales.

COURTNEY'S FLIGHT. Frank T. Courtney, a British aviator, in an attempt at a western Trans-Atlantic flight landed in the Azores on June 28 after a flight from England. He was flying in a Dornier-Napier whale flying boat accompanied by E. B. Hosner, his passenger and financial backer, Hugh Gilmour, wireless operator, and Fred Pierce, mechanic. The expedition was delayed at the Azores until August 1, when a start for Newfoundland was made and after unfavorable weather for several hours good conditions were encountered making possible a start across to the objective point. A fire breaking out on the plane, it was brought to the surface of the water without disaster and fortunately without an explosion. The fire was extinguished and 18 hours afterward the fliers were rescued by the steamship, *Minnewaska*, bound for New York.

CARRANZA'S FLIGHT AND DEATH. The good-will flight of Emilio Carranza, a Mexican aviation officer 23 years of age, came to an unfortunate end on July 12 when the young aviator crashed in a lonely bog in New Jersey. Carranza had flown from Mexico City to Washington with a single forced landing in North Carolina, and received many honors in Washington and New York where his trip was considered a return courtesy after the flight of Lindbergh to Mexico in the previous year. Carranza was flying in a plane which was a duplicate of the one used by Lindbergh in his flight to Paris. He left Roosevelt Field near New York on the evening of July 12 between thunderstorms. The following day his wrecked plane and body were found by three berry pickers.

FERRARIN-DEL PRETE FLIGHT. On July 4 the Italian aviator, Captain Arturo Ferrarin, and Maj. Carlo P. del Prete flew in the *Savoia-64*, a Savoia-Mardiette monoplane with Fiat motors in which on June 2 they had made a world's duration record for sustained flying of 58½ hours from Montecello Field near Rome. The object of their flight was Rio de Janeiro, Brazil, and they proceeded southerly over the Mediterranean Sea and along the African coast as far as Villa Cisneros, Rio de Oro, where they turned westerly across the South Atlantic. They made a landing at Point Genipabu near Natal, Brazil, making a non-stop distance record of 4475 miles, in 51 hours. A short delay was caused by damage to the chassis of the plane on landing, but this was repaired and the Italians flew to Rio de Janeiro where they received an enthusiastic reception.

GOEBEL-TUCKER CONTINENTAL RECORD FLIGHT. On August 20-21, Col. Arthur Goebel with Harry Tucker as passenger in the wasp engine monoplane, *Yankee Doodle*, flew from Los Angeles to New York in 18 hours and 51 minutes supplanting the previous record of 26 hours and 50 minutes made by McCready and Kelly, May 2-3, 1923, but flying from the east to the west coast. On October 25 Captain Collier with Tucker as a passenger flew the *Yankee Doodle* from east to west in 24 hours, 51 minutes, a record non-stop flight for this direction. On their return in the same airplane they crashed in Crook Canyon south of Prescott, Ariz., and both aviators were killed.

AROUND THE WORLD RECORD. Captain C. B. D. Collier also was the pilot on a record trip

around the world in which he was accompanied by John H. Mears. Leaving New York on June 29 they flew to the steamship, *Olympic*, where the *City of New York*, their Fairchild cabin monoplane with a 400 horse-power Pratt and Whitney Wasp engine was loaded and disassembled. After reaching Cherbourg six days later, they flew in the *City of New York* across Europe and Asia to Tokyo, crossing the Pacific on the steamship, *Empress of Russia*, and landing at Victoria, B. C., July 21. Thence they flew to New York stopping at Spokane, Minneapolis, Chicago, Cleveland, and Susquehanna, reaching Miller Field, Staten Island, on July 22, making the complete trip in 23 days, 15 hours, 21 minutes, and 3 seconds, using trains, planes, ocean liners, and motor cars wherever needed. Of the total of 19,725 miles traveled, 11,190 miles were actually flown in the air.

NATIONAL AIR RACES, 1928. The National Air Races for 1928, were held at Mines Field, Los Angeles, Calif., September 8-16. While the competitions did not develop any extraordinary records, yet the various commercial planes entered showed higher rates of speed than in prior contests and demonstrated the all around dependability of the new types of planes and engines participating. In connection with these air races an aeronautical exposition was held together with conventions of the Commercial Airplanes Manufacturers' Section of the Aeronautical Chamber of Commerce of America, the Society of Automotive Engineers, the National Aeronautic Association, and the National Airport Executives. The competitions opened with transcontinental races, the "On to Los Angeles Cross Country Race" from New York to Los Angeles, a distance of 2939 miles, Class A, for \$10,000 in prize money, being won by Earl Rowland of Wichita, Kansas, leading a field of 22 other entries and taking \$5000, first prize. His time was 27 hours, and 31 seconds, and he flew in a Cessna plane with a Warner motor. The Class B transcontinental race over the same distance with \$7000 as prize to the winner, was won by John Livingston in a Waco 10 plane with Whirlwind motor, his time being 22 hours, 56 minutes, 59 seconds. The Class C race also from New York to Los Angeles with a first prize of \$5000, was won by Robert W. Cantwell in a Lockheed Vega plane with a Wasp motor in 24 hours, 9 minutes, 1 second, there being three entrants in this competition. An international air race from Windsor, Canada, to Los Angeles, a distance of 2145 miles, with two entries, was won by William H. E. Drury in a Waco plane in 19 hours, 55 minutes, 41 seconds. In the California Class A race for a flight from San Francisco to Los Angeles, from a field of nine entries, H. S. Myrhes in a Simplex Red Arrow plane with Kinner engine won the first prize of \$1000, making the distance in 3 hours, 10 minutes, 20 seconds. The California Class B race from Oakland to Los Angeles with a first prize of \$1250 was won by H. C. Lippiat in a Travel Air plane with Whirlwind engine in 2 hours, 26 minutes, 49 seconds. There were eleven contestants for this prize.

The special air races at Mines Field were marked by a number of important competitions in which aviators from the United States Army and Navy competed, as well as by exhibitions by aviation units and individuals from the various services. Colonel Lindbergh made exhibi-

tion flights, as did Miss Earhart and other aviators, some of whom demonstrated new types of planes. Some of the more significant competitions and the winners are given herewith, Around the World Flight Memorial Races, limited to military VB-2B planes, distance 50 miles, first place, Lieut. Herbert P. Becker, time, 33 minutes, 21 seconds. Army Observation plane race, two-place type, won by Lieutenant Barber. United States Army, in a Douglas plane with Liberty engine, time, 28 minutes, 14.19 seconds, or a speed of 127.49 miles per hour. The United States Marine Corps 50-mile race, a closed event for Observation Squadron No. 8, was won by Michael Wodarczyk in 20 minutes, 14 seconds. The Mason M. Patrick Trophy Race over 120 miles, a closed event for pilots of the Third Attack Group, United States Army, was won by Lieut. George R. Acheson, in 51 minutes, 36.22 seconds, or a speed of 139.525 miles per hour. The John L. Mitchell Trophy Race, 120 miles, a closed event for United States Army pilots of the First Pursuit Group, was won by Lieutenant Lawson in 46 minutes, 31.72 seconds, or a speed of 154.743 miles per hour. The United States Navy Race, a closed event for navy pilots of the UB-2B Squadron, was won by Lieutenant Johnson in 20 minutes and 12 seconds. A civilian free-for-all for engines under 510 cubic inches over 50 miles, was won in the final heat by Earl Rowland in a Cessna plane with Warner motor, making the distance in 26 minutes, 50.74 seconds, or at a speed of 111.74 miles per hour. In the civilian free-for-all classes with engines of 720 cubic inches displacement or less over 50 miles, first place was taken by D. C. Warren in a Travel Air plane with a Hisso motor in 24 minutes, 18.75 seconds, or a speed of 123.39 miles per hour. In a similar race over 75 miles in the 800 cubic inches class, E. E. Ballough in a Laird plane with a Whirlwind J 4B motor won in 33 minutes, 52.78 seconds, or a speed of 130.82 miles per hour. In the Liberty Engine Builders' Trophy Race, 60 miles, for observation type two place planes, first place was taken by Lieut. J. L. Kane, United States Navy, in a Vought Corsair plane with a Pratt and Whitney Wasp engine in 25 minutes, 18.19 seconds, or a speed of 142.275 miles per hour. The Navy Pursuit race, 50 miles, for Navy pursuit pilots only, was won by Lieut. R. J. Crommelin, United States Navy, in a F-2-B 1 plane with a Pratt and Whitney Wasp engine in 20 minutes, 18.06 seconds, or a speed of 147.77 miles per hour. The Army Pursuit Race, 50 miles, for Army service pilots was won by Lieut. W. T. Cornelius in a Curtiss Hawk plane with a Curtiss D-12 motor in 20 minutes, 18.41 seconds, or a speed of 147.73 miles per hour. The Military Pursuit Race, 60 miles, for military planes only, was won by Lieut. T. P. Jeter, United States Navy, in a Boeing XF4B plane with a Pratt and Whitney Wasp motor, in 20 minutes, 53.85 seconds, or a speed of 172.26 miles per hour.

AIRPLANE RECORDS. During 1928 a number of new airplane records were made which indicated the continued advance of aviation. For Class C airplanes returning to point of departure without refuelling, the world's record for duration made at Jacksonville, Fla., Mar. 30, 1928, by Edward Stinson and Capt. George Halderman in 53 hours, 36 minutes, and 30 seconds, went from the United States to Germany. At Dessau,

Johann Risztics and Wilhelm Zimmerman in a Junkers W-33 plane with a Junkers LV 280 horse-power engine were in the air 65 hours, 25 minutes, July 5-7, 1928. Unlike other duration flights, these aviators were not forced down by lack of fuel, but from fear of landing on a field not properly lighted. The distance records both for closed circuit and airline flight went to Italy, whose distinguished aviator, Maj. Arturo Ferrarin (who had flown from Rome to Tokyo in 1920) and Com. Carlo Del Prete, in a Savoia-Marchetti S-64 plane with a 12-cylinder Fiat-22 water-cooled engine over the course Casale de Prati Torre Flaria, Fara, d'Anzio, May 31 to June 2, accomplished 7666.6 kilometers (4763 miles), until compelled to land by exhaustion of their fuel. These two aviators on their flight from Rome to Touros, Brazil, July 3-5, 1928, made the airline record of 7188 kilometers (4466 miles).

In Class C for an airplane with a pay load of 500 kilograms (1102.31 pounds) Reginald Schinzinger of Germany, in a Junkers W-34 plane with a Bristol Jupiter VII engine of 420 horse power, at Dessau on September 14, made an altitude record of 9190 meters (30,150 feet). The speed record for 500 kilometers for this class went to Great Britain, where Capt. H. S. Broad in a De Havilland "Hound" airplane with a Napier-Lion XI engine of 550 horse power at Stag Lane, Reading, made 255,333 kilometers (158,656 miles) per hour on April 27, 1928. Schinzinger on the date previously mentioned, with the same plane, achieved an altitude record with a pay load of 100 kilograms (220.412 pounds); while Captain Broad at the same time as mentioned above, made a speed record of 100 kilometers with a pay load of 100 kilograms, achieving 261.172 kilometers (160.280 miles) per hour, and also a speed record for 500 kilometers of 255,333 kilometers (158,656 miles) per hour. In this category for 1000 kilometers, the French aviator, M. Paillard, in a Bernard plane with Jupiter engine of 420 horse power on January 24 at LeMerle-Arles-Port Louis made 218,275 kilometers (135,628 miles) per hour.

With a pay load of 2000 kilograms (4409.24 pounds) Paillard and Camplan of France in a Bernard 190T plane with Hispano-Suiza 600 horse-power engine on the course from Le Bourget to Gondreville on Nov. 23, 1928, made a speed record for 100 kilometers of 223,546 kilometers per hour (138,904 miles per hour). The duration record for an airplane refueling in flight, 60 hours and 7 minutes, was made by Adjutant Louis Crooy and Sergeant Victor Groenen of Belgium in a De Havilland-9 plane with a Siddeley-Puma engine at Tirlement June 2-4, 1928.

During the year new records for light planes were made, and for two-seaters, weighing empty, less than 400 kilograms (881 pounds) records were made for closed-circuit and airline distance and altitude. The closed distance record went to Czechoslovakia, where Joseph Hermansky and François Machacek in an Avia BH-9 plane with a Walter 60 horse-power engine at Prague on July 11, 1928, made 1500 kilometers (932 miles). The airline distance record in this class went to Switzerland with 1305.5 kilometers (811.19 miles) made on October 16, by Captain Wirth and Mlle. Erika Naumann, in a Klemm-Daimler monoplane with a Mercedes-Daimler 20 horse-power engine flying from Boblingen air-

port to Mieschkance, Poland, supplanting a record of 1058.2 kilometers (657.4 miles) made on July 13 by two aviators from Czechoslovakia. In this same category an altitude record of 6054 meters (19,862 feet) was made by Capt. G. De Havilland and Mrs. De Havilland in Great Britain, flying in a DH Gipsy engine of 85 horse power at Stag Lane on July 27.

In the second category for light airplanes, comprising single-seaters weighing, empty, less than 200 kilograms (440 pounds), Charles Kaszala of Hungary in a Lampich H-MAFD plane with a Thorutskai 18 horse-power engine made an airline distance record from Budapest to Pola of 517.04 kilometers (320.03 miles).

In the third category for single-seaters weighing, empty, from 200-350 kilograms (440-771 pounds), Commandant Vichereck of Czechoslovakia on June 6-7 made a closed-circuit distance record of 2500 kilometers (1553 miles) flying in an Avia BH-11B plane with a Walter 60 horse-power engine at Prague. The airline distance record for such a plane came to the United States, where Harry J. Brooks, in a Ford Monoplane with a Ford-type AC motor of 30 horse power on Feb. 21, 1928, flew from Detroit to Titusville, Florida, a distance of 1564 kilometers (972 miles). This record on Oct. 5, 1928, was supplanted by Capt. A. Vichereck of Czechoslovakia in an Avia monoplane with a Walter 60 horse-power engine flying from Prague to Bednodenjanovsk, a distance of 2011 kilometers (1249.6 miles).

Major Mario de Bernardi, the famous Italian record holder, on Mar. 30, 1928, made a speed record for a seaplane of 512,776 kilometers per hour (318,624 miles per hour) flying in a Macchi 52 monoplane with a Fiat engine-type AS-3 over the Schneider Trophy Contest course at Venice, Italy, on March 30. A record of 319.57 miles per hour was made on November 4, at Calshot, England, by Flight Lieut. D'Arcy Greig, but it did not count as a world record, the conditions requiring at least five miles per hour better for a new record. In the class of seaplanes flying with a pay load of 500 kilograms (11,023 lbs.), Fritz Harder, of Germany, flying in a Junkers W-34 plane with a Bristol Jupiter VII engine of 420 horse power at Dessau on Nov. 6, 1928, made an altitude record of 7458 meters (27,749 feet), supplanting the American record of 22,178 of Lieut. George R. Henderson, United States Navy, made April 14, 1927.

For seaplanes with a pay load of 1000 kilograms (2204.12 pounds), records for duration and distance came to the United States. The former was accomplished by Lieutenants Zeus Soucek and Lisle J. Maxson, United States Navy, in a Navy PN-12 plane with two Wright R-1750 motors of 525 horse power each, flying at Philadelphia, May 25-26, when 17 hours, 55 minutes, 13.6 seconds was recorded. A distance record for a plane of this class of 2150 kilometers (1336 miles) was achieved by Lieut. A. W. Gorton, United States Navy, and Chief Boatswain E. E. Reber, in a Navy PN-12 plane with two Pratt and Whitney motors of 525 horse power each, flying at Philadelphia, July 11-12. In this class the altitude record went to Germany, where on November 7, 1928, Franz Kneer in a Junkers W-34 plane with a Bristol Jupiter VII engine with 420 horse power at Dessau, attained a height of 6389 meters (20,961

feet). Richard Wagner, of Germany, flying in a Dornier Superwal BR-142 plane with 4 Gnome-Rhone-Jupiter engines of 480 horse power each at Frederikshavn-Lindau on Jan. 20, 1928, made a speed record of 100 kilometers or 209.546 kilometers (130.105 miles) per hour, and on February 2, a speed record for 1000 kilometers or 177.279 kilometers (110.155 miles) per hour.

For seaplanes with a pay load of 2000 kilograms (4409.24 pounds), a number of new records were made during the year. Lieut. A. W. Gorton, United States Navy, and Chief Boat-swain E. S. Reber, flying in a Navy PN-12 plane with two Pratt and Whitney engines of 525 horse power each at Philadelphia on July 11-12, 1928, made a duration record of 16 hours, 39 minutes, a distance record of 2150 kilometers (1336 miles), and a speed record for 2000 kilometers of 130.427 kilometers (81.043 miles) per hour. Richard Wagner, of Germany, in the flight on January 20, already mentioned, made a speed record for 100 kilometers with a pay load of 2000 kilograms of 209.546 kilometers (130.105 miles) per hour, and on February 2 a speed record for 500 kilometers of 179.416 kilometers (111.483 miles) per hour, and for 1000 kilometers, a speed record of 177.279 kilometers (110.155 miles) per hour. Wagner also made a series of records in January and February with a pay load of 400 kilograms (881.8 pounds). For duration, on February 5, his record was 6 hours, 1 minute, 56 seconds; for distance on the same date, 1000.160 kilometers (621.468 miles). For altitude he achieved on January 23, 2845 meters (9334 feet), and on January 30, a speed for 100 kilometers of 209.546 kilometers (130.105 miles) per hour. On February 2 his speed for 500 kilometers was 179.416 kilometers (111.483 miles) per hour, and for 1000 kilometers, 177.279 kilometers (110.155 miles) per hour. On January 23 Wagner made a further record for the greatest pay load carried to an altitude of 2000 meters (6561.7 feet), namely, 4037 kilograms (8900 pounds).

NATIONAL AIR TOUR. This interesting annual competition to demonstrate reliability started with 25 aircraft from the Ford Airport, Detroit, Mich., on June 30, and after a trip of approximately 6500 miles, 24 of the competing craft made a landing at the starting point on July 28. One of the 25 planes dropped out of the contest in Oklahoma through failure to secure defective parts for an Americanized motor of foreign origin. First prize, with a total of 27,013.4 points for airplane efficiency and reliability, was won by John Paul Wood of Warsaw, Wis., flying a Waco 10 biplane with a Wright J-5 engine. Second place was won by a Ford plane piloted by Frank N. Hawks with a score of 24,390.8, and third by a Stinson Junior plane operated by Randolph Page with a score of 22,786.5. The point scores ran down to 5,523 for the last plane in the competition. The winner was awarded the Edsel Ford Airplane Reliability Trophy and \$2500 cash prize; while a second prize of \$2000, and a third prize of \$1750 were awarded, with cash awards to each competitor finishing in the first ten, with a special award of \$200 for every pilot completing the tour not included among the first ten winners. The flight was made over a carefully arranged course with 32 legs, the cities visited extending to the Pacific coast and comprising the leading towns of the United States. As in previous years, the scoring was based on a computation

which involved not merely speed but the weight carried per horse power, the engine displacement, and the performance over the individual legs of the flight; the aim being to determine the merits of the different planes on the basis of reliability rather than mere speed and power.

In connection with the National Air Tour of 1928 it was found that the formula used was not altogether satisfactory, and after the competition there was considerable discussion as to developing a more suitable formula for the 1929 National Air Tour. In the formula referred to, the load, speed, stick, and unsticked tests were made previous to the tour at the Ford Airport, and figures so derived were not changed, but the formula was applied to the individual planes considering the mileage and time over individual legs. It was further stated by critics of the formula that the preliminary tests were given an undue weight over actual performance in flight. The committee of the Detroit Board of Commerce having the contest in charge stated that it was perfectly willing to consider any suggestions looking to the development of more satisfactory conditions for this competition.

DIESEL ENGINES FOR AIRPLANES. During the year progress was made toward the development of an airplane engine of the Diesel type which would eliminate gasoline spark-plug-ignition systems and carburetor, affording increased safety from fire and increased economy. Furthermore the elimination of the electrical ignition system made it possible to employ the radio communication between planes without the usual interference on that account. In the United States in the early autumn the announcement was made that the Packard Motor Car Company had achieved success in its initial experiments with a Diesel type radial air-cooled engine which was installed in a standard Stinson-Detroiter monoplane and tested at the Packard Company's proving grounds near Utica, Michigan. This engine had a weight of less than 3 pounds per horse power thus bringing into practical use with airplanes a type of engine which hitherto had been considered unsuitable on account of the great weight per horse power of earlier types. In fact, the first experiments made in this field involved an engine weighing approximately 100 pounds per horse power, manifestly unsuitable for heavier-than-air aircraft. The Packard Diesel aircraft engine not only satisfied the requirements of weight, but was said to carry a plane 25 per cent further per pound of fuel than the types in use. The machine tested developed 200 horse power and had every promise of successful commercial application. No details of the engine were announced during the year as the company wished to make an exhaustive series of tests before putting the type on a production basis.

In Europe experimental engines employing heavy oil fuel and self-igniting on the Diesel principle were also developed and it was stated in November that the Junkers firm of airplane manufacturers, who were pioneers in the construction of all metal aircraft, had developed such a motor. As in the case of the Packard Diesel, details had not been supplied at the end of the year.

THE CIERVA AUTOGYRO. This remarkable invention of Juan de la Cierva, a Spanish engineer was successfully demonstrated during the year and attracted considerable attention, it being entered for the Guggenheim safety competition.

As recorded in various issues of the YEAR BOOK, the first autogyro was built about 1920 and involved two sets of rotating vanes placed one above the other and moving in opposite directions by air forces. This system did not prove successful as the vanes would not rotate at equal speed, but the subsequent arrangement was designed with but one rotating wing system where the pilot was able to control the angle of incidence with the blades, so that the required balances of lift could be secured by changing the incidence where the air speed was low. This plane also failed to accomplish the inventor's purpose as did a number of other attempts to secure mechanical control. In the successful autogyro in 1928 each blade was hinged freely to a bearing about which the system rotated so that it had a wide range of movement, being free to fold upward or droop downward. The usual type of rotating vane system designed for the autogyro consisted of four blades each built on a single tube spar. The section of these blades is so arranged that the main spar is not subject to heavy torsional loads, while the spar root is connected to the central block running on ball bearings of the mast projecting above the fuselage of the complete machine. The autogyro as so far developed consists of a standard airplane fuselage, landing gear, a tail unit, provided with an ordinary propeller driven by a normal type of engine. The ailerons are carried on the sides of the fuselage as there are, of course, no wings to the rudder and other controls are essentially the same as on an airplane. When the machine is driven forward under the influence of the propeller the horizontal air flow causes the vanes to rotate at a constant speed and to support the fuselage.

An impressive test of the autogyro was had on September 18 when Cierva left Croydon Air-drome, London, at 10.05 A.M. and after a brief stop at Lympne Field, Kent, crossed the Channel in 20 minutes, landing at St. Inglevert at 11.06 A.M. At 12.53 P.M. Cierva again arose and flew to Abbeville whence he continued to Le Bourget Field, Paris, arriving at 4.20 P.M. Señor de la Cierva on this trip was accompanied by Henri Bouche, editor-in-chief of *L'Aéronautique*, and an average speed for the flight was given as 90 miles per hour with an altitude approximating 4000 feet in crossing the Channel. The autogyro was accompanied for some distance on this flight by a large London-Paris Air Union commercial plane which at times it exceeded in speed with a maximum speed of over 105 miles per hour. On September 20 the autogyro was wrecked and Cierva and a passenger experienced minor bruises, the accident being attributed to a broken landing gear cable and not to any fundamental weakness in the craft itself. The type of autogyro developed in 1928 made a 3000-mile journey around England in August and functioned successfully in numerous tests. As a result of the trials several orders were placed for this machine during the year and a British company was organized for its manufacture.

COMMERCIAL AVIATION

In 1928, a year of progress and prosperity for the aeronautical industry, for the first time perhaps, at least in the United States, aviation and aeronautics in general were entitled to be considered as an industry in which the public as a whole rather than a few enterprising pio-

neers had become interested. It had passed out of the hands of the few and with the coöperation and management of banking and financial interests combinations and mergers were consummated and capital provided to carry on in adequate fashion both the operating and manufacturing sides of the industry, which began to rank as an independent effort and no longer related to the manufacture of motor cars and motor engines, the Ford and the Velie interests being the only large participants from that field.

It was estimated that approximately 4000 planes were built in 1928 and there was an active demand from transport companies which required sound and financially able manufacturing concerns to supply. Such organizations were entering the field and a better quality of product was asked for and supplied, while small and insignificant manufacturers were being forced out. Airplanes improved in 1928 as regards their technical points, especially in construction, workmanship, and detail, and though exhibiting special and minor improvements there was little that was revolutionary in design. It was observed that with many excellent planes manufactured in the United States, the medium priced machines were somewhat inferior especially when compared with the types of craft that had become popular in England where one manufacturer alone had turned out over 300 light airplanes of good workmanship. Better engines especially under 200 horse power were sought and seemed to be available in the United States though there were hardly enough of reliable types manufactured, but there was every prospect that satisfactory developments of the year would be turned out on a quantity basis in 1929.

With the growth of the industry, the personnel question and the facilities and methods for training became serious considerations. There was a lack of competent pilots to operate the increasing number of planes flying on regular routes as well as a dearth of other workers in the aircraft industry. At the end of the year the Aeronautics Branch of the Department of Commerce reported 4690 duly licensed pilots of which 34 were women. Of these 2927 were qualified for transport; 532, limited commercial; 66, industrial; and 1165, private. The Department of Commerce was conducting rigorous examinations for pilots, grouping them according to the class of service for which they were competent and intended.

AIRWAYS AND AIRPORTS. At the end of the year in the United States there were 9016 miles of airway equipped, under construction, or contracted for, for night flying, with 1479 electric or acetylene beacons. There were 259 lighted intermediate fields, 29 radio weather-reporting and communication stations on the Trans-Continental Mail and principal air routes, and telephone service on all other mail routes. It was anticipated by June 30, 1929, 2484 more miles would be added. The United States Weather Bureau had 46 upper-air meteorological stations over the mail system, mostly at airports. The United States at the end of the year had 425 municipal air ports in operation and with an additional 942 under construction or proposed. The city of Detroit during the year voted a \$5,000,000 bond issue to build an air terminal only 3½ miles from the civic centre. The long-

est runway was to be 7400 feet and the shortest, 4400 feet. St. Louis had an airport of 600 acres on which improvements were in progress; while Indianapolis had provided an air terminal on a 1000-acre track seven miles from the city.

In 1928 the San Francisco Airport reported 19,457 flights with 33,545 passengers in aircraft of all models and types. This airport was opened in May, 1927, and in the eight months of that year there were 2895 flights and 4560 passengers, making a grand total of 22,352 flights and 38,105 passengers with a business increase of approximately 600 per cent in the corresponding months of 1928 over those of 1927.

The passenger possibilities of the airplane during the year were recognized by the great railway systems of the United States and joint air-rail routes were developed and tickets sold for through traffic. See RAILWAYS.

AIR MAIL. On May 31 the Postmaster-General announced that effective August 1, the air-mail postage rate would be five cents for the first ounce and 10 cents for each ounce thereafter. Great increase in volume of air mail resulted, as indicated by the carrying in December, 1928, of 537,113 pounds of mail as compared with 165,768 pounds during December, 1927, and 39,350 pounds during December, 1926. The increase in December, 1928, over November, 1928, amounted to 112,648 pounds or 26.5 per cent. On the route from New York to Chicago there were carried 126,179 pieces, and from New York to Atlanta, 20,906 pieces.

NATIONAL SAFETY MEETING. The first Aeronautical Safety Conference to be held in the United States assembled on October 4 in New York City under the joint auspices of the Daniel Guggenheim Fund for the Promotion of Aeronautics and the National Safety Council. The general topics selected for discussion by Harry F. Guggenheim, head of the Foundation, included aircraft, airports, and airways, medical aspects of aeronautics, the public, and flying, passenger safety, flying, and ground personnel. There was also a special session for the consideration of safety in lighter-than-air craft. Col. Charles A. Lindbergh read a paper on "The Requirements and Training for a Commercial Pilot," stating that there should be more complete training for students desiring to become pilots. Notable papers were presented by various engineers, aviators, and leaders of the aviation industry.

INTERNATIONAL CIVIL AÉRONAUTICS CONFERENCE. An International Civil Aeronautics Conference, marked the twenty-fifth anniversary of the first flight by man in a power-driven, heavier-than-air machine, and was held in Washington, December 12, 13, and 14. This conference was convened at the suggestion of President Coolidge and authorized by an Act of Congress. It afforded the first real opportunity since the invention of the airplane for the entire aeronautical world to meet in America and discuss problems in the science and art of aeronautics. There were 30 foreign countries represented by some 125 delegates, in addition to the official delegation from the United States of twelve, including Orville Wright, the Secretary of Commerce, the various assistant secretaries in charge of aeronautics in the different departments, and other prominent individuals in the industry engaged in technical and commercial developments.

The conference began by the delegates attending the International Aeronautics Exhibition in Chicago the week of December 1, and on their return they stopped at Dayton, Ohio, and were present at a civic celebration in honor of the Wright Brothers. On December 12 the conference opened at Washington with an address on the development of aeronautics by President Coolidge. This address was significant in that the President referred to the Wright Brothers specifically and to their effort as "the first extended flight ever made by man in a power-driven machine." The President reviewed the history of man's efforts to fly and his address was heard by not a few of the men who had contributed so extensively to the development of aviation. Plenary sessions were held each morning with leading delegates presenting papers on various subjects and subsessions were held in the afternoons. The various papers presented before the conference were assembled and arranged for publication by the United States Department of Commerce so that they became available for purchase by the general public, forming an interesting summary of the state of aeronautics.

On the second day of the conference the Harmon Trophy was presented to Col. Charles A. Lindbergh for having done the most for aviation in 1927 on the basis of his New York-to-Paris flight. The trophy was presented by M. Flandin, vice president of the International League of Aviators and head of the French delegation. One evening of the conference was devoted to an exhibition of films depicting pioneer flights; a significant collection of this material having been assembled. The delegates, after an inspection of the Research Laboratory of the National Advisory Committee for Aeronautics at Langley Field, proceeded to Norfolk from where, on Monday morning, December 17, they went by motor to Kill Devil Hill, Kitty Hawk Beach, North Carolina, where with appropriate ceremonies a tablet dedicated to mark the spot of the first successful flight of an airplane was placed by the National Aeronautic Association on a rough boulder as a memorial. The bronze plate on this memorial boulder carried the following inscription:

"The first successful flight of an airplane was made from this spot by Orville Wright, Dec. 17, 1903, in a machine designed and built by Wilbur Wright and Orville Wright."

The corner stone of a Federal memorial also was laid with fitting ceremonies.

DANIEL GUGGENHEIM FUND. In June, 1928, the Daniel Guggenheim Fund decided to change its policy transferring emphasis from the work of assisting commercial aviation and stimulating public interest in its development to the consideration of fundamental aeronautical and aerodynamical problems. The Fund soon after its establishment divided its work into three classifications: 1. Scientific research. 2. Commercial development. 3. Public education. During the year each of the five educational institutions to which grants had been given to carry on instruction in aeronautics, was functioning successfully. In addition they were engaged in active research, each one being provided with a wind tunnel and adequate laboratory. The Guggenheim Fund continued during the year in the organization of its Safe Air-

craft Competition with prizes aggregating \$150,000 as outlined in the YEAR BOOK for 1927. This competition was to remain open until October, 1929, and a number of entries were made from Europe as well as from the United States. The list of entries at the close of the year was as follows: From the United States—Curtiss Aeroplane & Motor Co., Garden City, N. Y.; Heraclio Alfaro, Cleveland, Ohio; Charles Ward Hall, New York City; Shroeder-Wentworth Co., Glencoe, Ill.; J. S. McDonnell, Jr., & Associates, Milwaukee, Wis., and Branner & Winkle Aircraft Corporation, New York City. From Europe—The Cierva Autogyro Company, Ltd., London; Handley Page Ltd., London; The Gloster Aircraft Company, Ltd., Cheltenham, England; Vickers, Ltd., London; the De Havilland Aircraft Company, Ltd., England; and Breda, Italy.

In connection with commercial development, the Guggenheim Fund granted an equipment trust loan to finance the purchase of passenger carrying airplanes so as to demonstrate that this activity could be handled by banking organizations and also to promote commercial aviation in passenger service. A loan was granted to the Western Air Express for three multi-engined passenger airplanes flying between Los Angeles and San Francisco. These planes started operation at the end of May. In connection with this service, the Fund sponsored a complete weather reporting service on this airway in co-operation with the United States Department of Commerce, the United States Weather Bureau, and the Pacific Telephone and Telegraph Company. As a result of the elaborate system established reports were communicated from various stations three times daily, and trained meteorologists would forecast flight conditions for the entire area, advising the pilot as to the course to be followed, and keeping him informed while in flight of weather changes.

ORIGINAL WRIGHT AIRPLANE. During the year the long-standing controversy between Orville Wright and the Smithsonian Institution reached a climax in the decision of the surviving inventor to place the original Wright airplane in the wing of the Science Museum, South Kensington, London. This was due to the fact that in Mr. Wright's opinion due recognition of the achievements of himself and his brother had been withheld by the Smithsonian Institution, and that on the Langley plane labels had been placed that in his opinion were false and misleading. Mr. Wright unquestionably had the sympathy of a large number of fellow aviators, and many who followed the controversy believed that his position was justified. In fact during the year, Dr. C. G. Abbot, Secretary of the Smithsonian, issued a pamphlet dealing with relations of that organization with the Wrights and their inventions and invited Mr. Orville Wright to deposit the original plane for perpetual preservation. In the meantime the label on the Langley plane which had been changed several times was again altered, and the Smithsonian apparently withdrew from what many considered a partisan position in favor of its former Secretary, Dr. S. P. Langley. It was indeed rather galling to many Americans interested in aeronautics to learn that on Dec. 17, 1928, the Royal Aeronautical Society in London held a dinner to celebrate the 25th anniversary of the first mechanical flight at the Science Museum at

South Kensington, the dinner being served under the Wright plane.

AÉROPLANES. See AÉRONAUTICS.

AFGHANISTAN, af-gān'-i-stān'. An independent kingdom of Asia between the parallels 29° and 38° 20' north latitude and 61° and 72° east longitude with a narrow strip extending to 75° east. The estimates of the area vary from 245,000 to 270,000 square miles. The population is estimated at about 12,000,000 although some authorities place it at about half that number. Capital, Kabul, with a population of about 100,000. Other important towns are Kandahar, Herat, and Mazar-i-Sharif. The Afghan is the dominant race, and the chief tribes are the Duranis and the Ghilzais, numbering about 2,200,000. The prevailing languages are Persian and Pushtoo, and the dominant religion is that of Islam.

Little is known of Afghanistan's natural resources as the area has not been carefully surveyed and prospected. The northern part is said to be fairly rich in copper, and lead is found in several sections. A gold mine is being operated at Kandahar under the supervision of a British mining expert, and precious stones, particularly lapis lazuli, are found. Manufacturing of the cottage industry type is carried on throughout the country, making soap, cloth, boots, and certain other articles for local consumption. Carpets are made both for domestic consumption and for export. Until within the last few years Afghanistan has been almost completely isolated from the remainder of the world, but recently, under the leadership of King Amanullah, rapid strides have been made in opening the country to international trade and intercourse. During 1928 it was reported that the construction of a road from Kabul to the British frontier was proceeding very rapidly.

The most convenient means of reaching

Afghanistan from the outside world is through British Indian ports, as the country has no seaport of its own. India's trade with Afghanistan amounts to about \$15,000,000 per annum. Cotton goods, indigo, sugar, hardware, leather, silver, and automobiles are taken by Afghanistan in exchange for carpets, timber, fruits, vegetables, several kinds of nuts, wool, spices, silk, hides, cattle, tobacco, pulse, ghee, asafoetida, and other drugs. Many of the commodities passing from India to Afghanistan are of foreign manufacture, and a good proportion of the import from Afghanistan is designed for reexport to Europe and the United States.

Since 1922 the government of Afghanistan has been a constitutional monarchy with legislative and state assemblies, and a cabinet which is presided over by the king himself. The reigning king in 1928 was Amanullah Khan, who ascended the throne as Amir, when his father was assassinated in 1919. In 1926 he changed his title from Amir to King. The European tour of Afghanistan's king in 1928 brought into world prominence the little-known Eastern kingdom.

HISTORY. During the year the press teemed with accounts of the doings of this small kingdom, both at home and abroad. The Amir, Amanullah, and his Queen, Shah Khanum, made a tour of Europe, which included visits to Italy, France, Great Britain, Germany, and Russia. The royal couple were received with open arms on all sides and with a show of pomp and splendor which reminded many observers of pre-war times. Of course to the cynics there was, to some extent, a reason for all this attention given to the ruler of the little-known Asiatic state. He was pestered with business agents almost every day of his visit for concessions to exploit his kingdom or with contracts to purchase huge quantities of supplies to send home. Amanullah showed inklings of great diplomacy by purchasing a small amount of supplies in each country and affably receiving all requests for concessions and promising to give them his undivided attention as soon as he had enough time, promising, in the meantime, to grant such requests to that applicant who would benefit his country most. After his triumphal tour of Europe, the Amir made state visits to Persia and Turkey. Treaties of amity and good will were signed among the three countries and protocols were agreed to by the terms of which each country agreed to take a conciliatory attitude in case of war between one of the signatory countries and an outside power.

One of the principal results of the Amir's tour was a real attempt to modernize or westernize his country. Under the leadership of the Queen, the emancipation of women was undertaken, and radical steps such as the removal of the veil in public and the education of girls, were inaugurated, not, however, without bitter protests on the part of the leading men of the country. Students were also sent abroad to study methods of engineering, education, and politics in the more forward-looking states of Europe. A vast programme of public works, including roads and bridges, railways, telephones and telegraphs, air development, etc., was initiated almost as soon as the ruler reached home. This, of course, necessitated a large outlay of money, which with the consequent increase of taxation and the exorbitant cost of the king's western tour, kindled fires of unrest and discontent not only with-

in the city of Kabul, but in the outlying districts as well.

Other radical changes involved the abolition of all titles and forms of nobility, the increase of military service from two to three years, and the reduction of the powers of the religious leaders. These reforms were adopted mainly by decree of the Amir, although some of them were participated in by the legislative assembly, which was to be replaced by a National Assembly elected on the basis of universal manhood suffrage. An abortive attempt to introduce the cabinet system of government failed because no one could be found who was strong enough politically to form a cabinet which would enjoy the confidence of the legislative assembly.

The opposition to the westernizing programme of the Amir was deep-rooted and powerful. As noted above, mutterings were heard from the very beginning, and the climax was reached when an order was issued compelling the tribesmen of the hills to become citizens of Afghanistan by going through a regular process of naturalization. This drastic move, as far as the tribesmen were concerned, resulted in an armed revolt, which broke out in November. From the time of its inception down to the closing days of the year, conflicting reports were published in the press concerning its course. A strict censorship was established at Kabul and outside observers were compelled to rely on reports emanating from northern India. The leadership in the revolt was taken by the Shinwari tribe, who undoubtedly had the backing of the Moslem priests who bitterly resented the reduction of their powers and the attempt to institute educational reforms, which might ultimately reduce them to an impotent class.

The first reports of the fighting indicated that the attacks of the tribesmen had been severely repulsed under the leadership of the Amir himself. As the year drew to a close, however, the King's position was not painted in such rosy colors. His capital was cut off from outside communication and several spectacular rescues of foreigners were made by airplane sorties from British India. Considerable damage was done to buildings in the national capital during the attack of the tribesmen. On the last day of the year it was reported in the press, that, although conditions had quieted to some extent, the position of Amanullah was anything but strong. It was reported that in order to save his kingship he was compelled to accede to the wishes of his opponents who had presented a message demanding that no foreign legations should be permitted to remain in Afghanistan, that no more Afghan students should be allowed to go abroad to study, and that those students already sent abroad should be immediately recalled. For the time being, at least, it appeared the new-born forces of westernization were compelled to succumb to the traditional male superiority complex of the East.

AFRICA. The various divisions of Africa in this volume are discussed under their own heads. See articles on the respective countries and territories, including ETHIOPIA; KENYA; EGYPT; MOROCCO; TUNIS; SOUTH AFRICA, UNION OF, etc. See also the articles ANTHROPOLOGY; ARCHAEOLOGY; and EXPLORATION.

AFRICA, CULTURE AND LANGUAGE OF. See PHILLOGY, MODERN.

AGRICULTURAL EXPERIMENT STATIONS. Experiment stations were in operation

in all the States of the United States and in the territories and insular possessions—Alaska, Hawaii, Porto Rico, Guam, and Virgin Islands. The total funds available for their support reached a sum in excess of \$14,000,000. Of this the Federal Government supplied \$3,597,640, including an additional \$480,000 under the Purnell Act of 1925. The remainder came from State appropriations and allotments, fees, sales, etc.

Numerous additions were provided in the form of buildings, lands, and other facilities supplied by the States. The growth of this enterprise is further indicated by the increase in the number of research projects, aggregating nearly 7000, and a working force of approximately 3000 persons. An unusual number of changes occurred in the directorships, affecting no less than 13 States,—Arizona, Indiana, Louisiana, Massachusetts, Michigan, Nebraska, New York, Oklahoma, Pennsylvania, Rhode Island, Texas, Utah, and West Virginia.

Congress made applicable to the Territory of Hawaii a portion of the Federal appropriations for agricultural experiment stations, to begin July 1, 1929. A station was to be established in the College of Agriculture, to be conducted in close coördination with the Federal station in operation in the Islands since 1901.

The North Carolina Experiment Station, the second oldest in the United States, celebrated its semi-centennial April 19, with appropriate exercises and a large representative audience. An experiment station was organized within the Georgia State College of Agriculture.

An interesting development was the establishment of the Giannini Foundation of Agricultural Economics at the University of California, with a contribution of \$1,500,000 by the Bancitaly Corporation of San Francisco in tribute to its founder and president, Mr. A. P. Giannini. The purpose of the foundation is research, and its function in that line is given broad scope. A half-million dollars was designated for the construction of Giannini Hall to house the foundation, completing the agricultural quadrangle at Berkeley. Dr. C. B. Hutchinson was appointed director of the foundation and associate director of the experiment station.

The research professorship in soils at the Cornell College of Agriculture provided by Charles Lathrop Pack, was filled by the appointment of Dr. Lars G. Romell of the Swedish Forest Experiment Station, and research in that field inaugurated.

A new system of lysimeters with a capacity of 149 tanks was installed at the Tennessee Station, embodying the latest ideas for such equipment to study soil and fertilizer problems.

A plant industry building at the Minnesota College of Agriculture costing \$250,000 was dedicated in June, providing enlarged modern facilities for research in agricultural biochemistry. Eight new greenhouse units were provided at that institution for research in plant genetics, plant physiology, plant pathology, and farm crops, equipped with artificial lights so that two generations of cereals or corn may be grown in one year to hasten development of new varieties.

In Mississippi an appropriation of \$100,000 was made for a main station building, and an aggregate of \$513,000 provided for the biennium 1928–29, including the maintenance of five sub-stations.

A tract of 500 acres of abandoned farm land

near Ithaca was given to Cornell University for forestry experiments and as an observation ground for botanists.

The West Indian hurricane in September severely damaged the buildings, orchards, and other experimental work of the stations in Porto Rico and Virgin Islands. The Everglades Station in Florida likewise met with severe injury from the hurricane and the attendant flooding from Lake Okeechobee.

Two publications of special interest relating to research in the social sciences were issued during the year under the direction of the Social Science Research Council. One was a two-volume work on *Research Method and Procedure in Agricultural Economics*, comprising 468 pages. The other was on *Rural Sociological Research* in the United States, comprising 114 pages. Both were issued in mimeographed form, for the assistance of workers in the respective fields.

Prof. I. P. Roberts, long director of the Cornell Experiment Station, and Prof. Willet M. Hays, a leading agronomist and later Assistant Secretary of Agriculture, died during the year. Dr. L. L. Van Slyke, chemist of the New York State Station at Geneva, and Prof. H. H. Wing for 40 years connected with the animal husbandry work at Cornell, retired from active service.

While experiment stations were expanding less rapidly in Europe and other countries, several developments were to be noted. In the United Kingdom a movement was under consideration for the enlargement of agricultural research, following recommendations of the Imperial Agricultural Research Conference in 1927 and meetings in 1928 attended by representatives from various parts of the Empire. The proposals formulated were before the governments. A chain of 12 "illustration stations" was in operation in British Columbia under the supervision of the experimental farm at Agassiz. These are essentially demonstration farms with some experimental work and also the growing of improved seed for sale.

The Australian Commonwealth decided to establish in Queensland one of its chain of research stations, providing £50,000 for capital expenditure and £10,000 annually for maintenance. A series of primary produce experiment stations was authorized in Queensland, to be financed by assessments levied on growers of primary produce, matched by government appropriations. The South Australian Agricultural Education Act of 1927 provided £5000 for the extension of research at the Waite Agricultural Research Institute, with increases bringing the amount up to £15,000 by 1936–37. The Tea Research Institute of Ceylon inaugurated its work with an entomologist, mycologist, and biochemist.

An experiment station for wheat growing was established in Sicily, supported jointly by that country and the Italian Government.

The Sakrand Agricultural Research Station was established at Sind, to deal with problems under the rapid increase of irrigation, including those resulting from the adoption of the Sukkur barrage scheme. The Royal Commission on Agriculture in India recommended the establishment of an Imperial Council on Agricultural Research, with a fund of \$1,750,000.

An agricultural experiment and demonstration station in the interior of China was planned to be opened in connection with the Oberlin-Shansi Memorial School.

Consult also *Report on the Agricultural Experiment Stations*, 1927, U. S. Department of Agriculture, Office of Experiment Stations.

AGRICULTURAL EXTENSION WORK. Coöperative extension work in agriculture and home economics was carried on in the 48 States by the U. S. Department of Agriculture and the State agricultural colleges under the Smith-Lever Extension Act of May 8, 1914, and related Federal and State legislation. Through this system over 4,500,000 instances of the adoption of improved practices on the farms and in the farm homes in 1927 were reported. These were brought about largely by the successful conduct of practical demonstrations to farmers and their families under the direction of the extension agents and through meetings, tours, campaigns, press articles and other activities of the extension forces.

In 35,321 communities extension programmes were worked out with the farming people, which provided plans for more efficient farm production and marketing and for better living conditions. Work relating to farm crops, horticulture, animal husbandry, dairy husbandry, and poultry formed the greater part of the activities of the agricultural agents. Efforts to improve marketing practices dealt with the standardization of farm products, the development of high quality products, and the organization and conduct of coöperative marketing. Assistance in marketing was given to 422,000 farm families and 3434 coöperative associations, which did a business of over \$200,000,000. Information obtained in Kansas on the influence of the age of farmers upon the adoption of improved agricultural practices showed that men between 36 and 55 years of age made as much use of extension information as did younger farmers. And in a general way the same was true of farm women.

The work among the farm women related to clothing, foods, nutrition, house furnishing, home management, health, sanitation, and beautification of home grounds. Over 16,000 community clubs with 307,565 members were in operation.

The work among the farm youth continued to grow in interest and importance. About 620,000 boys and girls were enrolled in 44,188 4-H clubs, of whom 64.4 per cent completed all the work on their projects. They conducted 776,000 demonstrations in the production of crops and livestock and in home improvement, with the assistance of over 60,000 volunteer local leaders. A second national 4-H club camp was held at Washington, D. C., on the grounds of the Department of Agriculture in June, 1928. Over 1000 boys and girls belonging to 4-H clubs in 43 States attended the International Livestock Exposition at Chicago in 1928. Clarence Goecke, of Iowa, 12 years old, won the grand prize for a steer in the open competition and sold his animal for about \$8000. He also took about \$3000 in prizes. Cups offered by Sir Thomas Lipton for the best records in demonstration projects conducted at home by boys and girls were won by Sybil Herring, of Illinois, and John Jackson, of Louisiana.

Emergency activities continued to be features of the extension work in various parts of the United States. Extension agents in the flooded areas of the Mississippi Valley made special efforts to put devastated farms on a self-supporting basis. Assistance was given to the American Red Cross in distributing improved varieties of

cotton, soy beans, and garden seeds. The county forces were strengthened through the use of special Federal funds. An Act of Congress of Jan. 26, 1928, authorized an appropriation for the employment of extension agents in needy counties in that region and the Agricultural Appropriation Act of May 16, 1928, provided \$400,000 for this purpose. Similar service was rendered by extension agents in Vermont following the great flood in that State in October, 1927. County agents, at the request of the governor, made a survey of the agricultural damage caused by the breaking of the St. Francis dam in California in March, 1928, which flooded over 10,000 acres in Ventura County.

Extension workers in the region invaded by the European corn borer continued efforts to impress the farmers with the seriousness of the situation created by the ravages of this pest and at the same time encouraged them to undertake measures for dealing with it as a permanent foe to corn growing. Numerous demonstrations of mechanical control methods were made and much useful information was given at community meetings and through bulletins, posters, and the press.

Demonstration work on Federal reclamation projects in the Western States was continued with the coöperation of the Reclamation Service of the Department of the Interior and the State extension services. Definitely planned programmes relating to crop and animal production and marketing were formulated and put into effect with the aid of the people living on these projects. Special extension work in forestry was continued with Federal funds provided under the Clarke-McNary Act. This included demonstrations and educational work regarding forest planting, woodland management, and forest protection.

The Capper-Ketcham Act of May 22, 1928, provided for the further development of the coöperative agricultural extension work by authorizing the annual appropriation of \$980,000, of which \$20,000 goes to each State and the Territory of Hawaii, beginning with the fiscal year 1929 and for each year thereafter the additional lump sum of \$500,000. At least 80 per cent of the sums appropriated under this act must be spent for the salaries of county extension agents, who "shall be men and women in fair and just proportions," and these funds may be used for the promotion of agricultural trains.

The motion-picture laboratory of the Department of Agriculture had about 420 films. There was a great increase in the distribution and use of these films and it was estimated that they were shown to 10,000,000 people in 1928.

The Office of Exhibits made exhibits at 76 State, interstate, and national fairs.

For the fiscal year beginning July 1, 1928, about \$575,000 was appropriated for the Extension Service in the U. S. Department of Agriculture. Of the \$22,492,800 used in the States and Hawaii, about \$1,346,500 was derived from direct appropriations to the Federal Extension Service and other branches of the Department of Agriculture. \$54,600 for forestry extension work under the Clarke-McNary Act, \$6,182,935 under the terms of the Smith-Lever Act, and \$980,000 under the Capper-Ketcham Act, making the total amount of the Federal contribution \$8,564,050. This was met by approximately \$13,928,600 from sources within the States, including \$5,747,500 to offset Federal funds under the Smith-Lever and Clarke-McNary acts, \$2,298,200 additional State

and college funds, \$4,787,500 from counties, and \$1,095,400 from farm bureaus and miscellaneous sources.

About \$11,225,000 was used for the demonstrations and other activities of the county agricultural agents and their leaders. Much of their work bore on the problems of the farm home, but \$4,250,000 was allotted to the work of the home demonstration agents. About \$1,430,000 was used for special work among boys and girls, about \$4,320,000 for the tasks of the specialists in various branches of agriculture and home economics, \$910,000 for administration and \$265,000 for publications.

On June 30, 1928 there were in the 48 States 2318 white county agricultural agents, 941 home demonstration agents, 145 paid county leaders of boys' and girls' 4-H clubs, and 1004 specialists in the various branches of agriculture and home economics with headquarters at the agricultural colleges. The white agents did much effective work which directly benefited the Negro farmers and their families, but in the Southern States there were also 271 Negro men and women agents. The number of Negro agents was temporarily reduced from the lack of funds for their support in the flooded areas of the Mississippi Valley. The Negro agents not only promoted improved agricultural production and food preservation but did much to better child care, health, and sanitation in the rural homes.

The work in each State was administered by an Extension Director, with numerous State and district leaders. Including the supervisory officers and their assistants 5161 persons trained in agriculture or home economics were employed in the States in 1928. These public agents were assisted by over 240,000 voluntary local leaders in rural communities in the several States.

Farmers' institutes were held in 1927 under official supervision in 11 States. In all, 2260 institutes were conducted with an attendance of 1,163,245.

In Hawaii, extension work was continued by the Federal Experiment Station during 1928. An Act of Congress of May 16, 1928, brought this Territory under the provisions of the Smith-Lever Act and work will hereafter be done in co-operation with the University of Hawaii.

In Porto Rico, extension work was continued by the Insular Bureau of Agriculture. The Federal Experiment Station in the Virgin Islands continued extension work on the Island of St. Thomas.

GREAT BRITAIN. In England and Wales, extension work was continued through the county agricultural councils on plans approved by the Ministry of Agriculture and Fisheries. In 1927, 344 men and women gave their whole time to extension instruction. Of these 49 were agricultural organizers in 53 counties, who did demonstration, lecture, and advisory work and directed the activities of specialists. There were also part-time workers. Instruction was given in agriculture, horticulture, dairying, poultry, farriery, bee-keeping, veterinary science, farm accounting, and manual processes. The universities with agricultural departments and the agricultural colleges had 67 chemists, entomologists, mycologists, dairy bacteriologists, veterinarians, and economists who traveled among the farmers and gave them expert advice. The women's rural institutes, chiefly attended by married women, continued to provide training in practical and tech-

nical subjects, improve village life, and aid local education committees in child-welfare work. The courses and lectures given in connection with the institutes dealt not only with home economics and handicraft but also with English literature, history, citizenship, arithmetic, household accounts, singing, and music.

A subcommittee of the interdepartmental committee of the Ministry of Agriculture and Fisheries and the Board of Education reported in April, 1927, the results of an extended investigation regarding the status of practical education for rural women and girls and made recommendations for the improvement and extension of the facilities for such instruction. It was found that only about 80 women were employed full time in agricultural education in England and Wales as compared with 300 men, and 18 part-time women workers against 176 men. There was a serious lack of facilities for instruction in home economics. Very little was being done for girls from 14 to 16 years of age. The subcommittee recommended that the local education authorities should give increased assistance to such voluntary organizations as women's institutes in the instruction of women in home economics, that more itinerant instruction should be given in dairying, poultry, horticulture, and farm household management, and that scholarships should be provided, permitting women to pass from itinerant courses to farm institutes and to more advanced courses. For girls from 14 to 16 years of age, organized day courses in agriculture, home economics, and general subjects should be provided in every county and correlated with the young farmers' club work, with scholarships for additional instruction.

In Scotland an investigation was made in 1927 under direction of the Board of Agriculture to determine "how far agricultural education is reaching those actually engaged in farming in Scotland and is directly productive of improvement of farm practice." For 25 years extension work had been conducted in Scotland by county organizers and their assistants and by officers of the agricultural colleges at Aberdeen, Edinburgh, and Glasgow. There had been a great change in the attitude of progressive farmers toward this work and they had become very favorable to it as giving them practical benefits. In crop production, use of fertilizers, dairying, and poultry husbandry much improvement in farm practice has taken place. However, agricultural education has not yet reached the mass of farmers, it is said. There was a lack of farm organizations interested in the extension work and therefore too much time had been spent by the extension workers in giving personal service to individual farmers. Local winter courses were regarded as one of the best means for reaching large numbers of farmers.

CANADA. In the several provinces extension work was continued by public agents and through short courses at colleges and boys' and girls' clubs. In Nova Scotia since the reorganization of extension work in May, 1926, by the Ministry of Natural Resources a great expansion of activities has resulted. During 1927 some 14 agricultural representatives (county agents) were employed. They held 643 meetings, aided boys' and girls' clubs, organized school and community fairs, formed livestock shipping associations, and gave poultry demonstrations. With the co-operation of the railroads, demonstration trains

were run, carrying dairy cows, hogs, poultry, models of hen houses, dairy equipment, and exhibits of foods to promote health. Pig, calf, and poultry clubs of boys and girls were carried on in 12 counties. In the Province of Quebec 52 calf-feeding competitions were conducted by boys' and girls' clubs, in some of which the same animal competed three years. A farm boys' week was held for the first time at MacDonald College in July, 1928, at which 21 counties were represented by 250 boys. In Saskatchewan, farm boys' camps have become an important feature of the junior extension work of the university and are conducted in coöperation with agricultural or other rural organizations. Twenty-eight boys' and girls' bacon-pig clubs were conducted in this province in 1927 and the animals were exhibited for prizes at local fairs and an interclub competition at the university. In the winter of 1926-27, the extension department of the university operated an agricultural lecture car in the northern part of the province in connection with the short courses for farmers.

AUSTRALIA. Extension work continued to be carried on under the Departments of Agriculture in the several provinces.

UNION OF SOUTH AFRICA. The division of agricultural education and extension in the Department of Agriculture supervised boys' and girls' clubs, called Prosperity League Clubs, which were organized and managed by teachers in the rural schools.

INDIA. Seven of the 8 provinces of India had a department of agriculture in charge of a director of experimental and demonstration work. Each province was divided into districts consisting of thousands of villages. The work in the districts was supervised by deputy directors or superintendents. A considerable force of itinerant teachers and demonstrators was employed. In some provinces skilled laborers, generally native plowmen, trained on government farms, assisted in demonstrating new methods or implements. Demonstrations on the farmers' own land had generally been most effective. Sometimes small tracts of land at the villages were leased for demonstration purposes. Itinerant demonstration parties carrying improved implements in carts went from village to village and showing how they are operated on the farms, have done good work. Seed of improved varieties of wheat, cotton, and sugar cane were widely distributed. Short courses on special subjects held on government farms were found valuable. A variety of publications in the native language were issued by the agricultural departments.

Demonstration trains were operated in Bengal and Punjab in 1927. There were special cars for crops, animal husbandry, public health, weaving and tanning industries, and coöperative activities. In Punjab "concentration work" was conducted in 56 villages in 1927. In such work the farmers of a village coöperate, using the same improved implements, seeds, and farm practices. The Royal Commission on Agriculture in India, which made a detailed report in 1928 on existing conditions, with recommendations for the improvement of agriculture and the promotion of the welfare of the rural people, favored demonstration work as the best method of inducing rural people to adopt new and improved practices. Institutes for women were begun in Bengal in 1913 and about 80 rural institutes were operating there in 1928. A cen-

tral organization for this work was established in 1925, which publishes a monthly magazine in the native language.

FRANCE. The extension organization under the Ministry of Agriculture included inspectors-general in the eight agricultural regions, directors of agricultural services in the several departments (counties), and professors of agriculture or special subjects. Work in agriculture and home economics for women and girls was continued. Some private organizations, such as the Patriotic League of French Women, held "rural weeks" in the country for the purpose of implanting in girls of all social conditions a love for the country by giving them religious, family, home management, and agricultural training which may be continued at their homes by suitable reading, correspondence courses, etc.

BELGIUM. The Ministry of Agriculture continued to carry on extension work through numerous specialists in agriculture, veterinary medicine, forestry, and farm housekeeping. The League of Belgian Peasants in 1927 had over 110,000 farmers in its parochial agricultural guilds, about 73,000 women and girls in its farm women's league, and about 13,000 members in its 350 boys' sections. Through its publications and a considerable variety of extension activities, the league continued to have large influence on the betterment of agriculture and country life in Belgium.

DENMARK. Extension work continued to be carried on by the Department of Agriculture, the Royal Agricultural Society, and about 120 local farm organizations. Boys' and girls' club work on the American plan was begun in Denmark in 1924 through the coöperation of the Ministry of Agriculture and the International Education Board in the employment of F. P. Lund of the Office of Coöperative Extension Work of the United States Department of Agriculture, who managed the work until 1926. A National Committee for Aiding in the Advancement of Young People in Agricultural Work was then formed by the Ministry of Agriculture, with which the International Education Board continued to coöperate by contributing funds. National leaders in agriculture and home economics were appointed and money was allotted to agricultural societies for the salaries and expenses of itinerant local advisers. A considerable number of different projects for boys and girls were undertaken, as well as winter short courses.

THE NETHERLANDS. The Department of Agriculture continued to carry on extension work through inspectors of agriculture. Advisers in agriculture and horticulture were located in the 11 provinces, together with specialists in dairying, animal and poultry husbandry, and beekeeping.

SWEDEN. Extension work continued to be carried on by over 200 advisers and experts employed by the 26 county agricultural societies, subsidized by the general Government. The young farmers' league, with local groups in the several parishes, continued its activities, which resemble those of boys' and girls' clubs. The league receives contributions from the Government, the general Agricultural Society of Sweden, the Clara Lachman Fund, and the International Education Board. The girls were trained by lectures followed by discussions, practical courses in home economics and weaving, demonstrations, competitions, and study trips.

FINLAND. The Department of Agriculture continued to supervise extension work with men and women, which receives annual subsidies from the Government. These funds are divided among agricultural and home management societies, through which they are distributed to local organizations. Much attention has been given to home industries. Itinerant schools are conducted in which the men are taught carpentry and the women weaving and sewing. There are also more than 100 "practice homes" in which girls are trained by farm housewives.

GERMANY. Experiment clubs for large landowners and for small farmers continued to operate in Saxony, East Prussia, and Wurttemberg. These clubs were first organized in 1921 among large landowners in Saxony. The chamber of agriculture of that province soon undertook to organize clubs among the peasant farmers, with the coöperation of the local agricultural schools. At first all the clubs paid their own expenses, but since 1926 the chambers of agriculture have given contributions from public funds to the small farmers' clubs, and sometimes to those of the large landowners. Each club has a director, who is usually a farmer's son, trained in an agricultural school. Experiments in crop growing, animal feeding, dairying, etc., are conducted on the farms of club members. The farm bookkeeping bureaus continued to keep books for farmers or to organize bookkeeping on the farm and to help the small farmers through special courses, lectures, and sale of forms. Since 1925 the Ministry of Agriculture, Domains, and Forests of the empire has made provision for the practical training of girls through a two-year apprenticeship in accredited farm homes. Such apprenticeship forms a part of the training of farm home teachers. The rural housewives' societies begun in 1898 in East Prussia and united in an Imperial Federation in 1916, had in 1928, 23 provincial associations and 1350 local societies. These societies have lectures and courses in home economics and agriculture, have established markets, and have collaborated with the chambers of agriculture in the improvement of home management, gardening, and poultry work.

CZECHOSLOVAKIA. Through an agricultural broadcasting commission organized in 1925, daily programmes on agricultural subjects, trade, and meteorological reports are regularly broadcast, and also weekly programmes for the farm women.

SWITZERLAND. The Swiss Peasants Union continued to conduct extension work through traveling lecturers. Boys who have completed the compulsory primary school may attend short courses of a few days on agricultural subjects in village schools or winter courses from November to April in primary agricultural schools. Girls may attend 15-day courses in home economics, horticulture, poultry, etc., held at agricultural schools or by itinerant teachers in the villages.

ITALY. A corps of itinerant teachers supported with public funds continued to instruct farmers in intensive methods of agriculture and the use of new crops and improved implements. From 1926 the Federation of Agricultural Consortia, in collaboration with the Italian Radiophone Union, has broadcast week-day programmes on commodity prices, weather forecasts, and agricultural subjects. Itinerant courses in agriculture have been given for three years by a national organization, which operates automobiles equipped for showing motion pictures in the

open air. The films are obtained from the Institute of the Cinematographical Union founded by royal decree in 1926 to collect and distribute agricultural films.

ECUADOR. Since 1924 a board of agriculture under the Ministry of Public Instruction, Agriculture, and Justice has supervised agricultural experimentation and education, including extension work by itinerant officers who give practical instruction and assist in the control of plant and animal diseases and pests. In the summer of 1927 an intensive course in agriculture for the training of extension agents was given.

BRAZIL. On the recommendation of a commission appointed by the Minister of Agriculture, Industry, and Commerce, a law was enacted in 1926 which provided for extension work on the general plan used in the United States. The demonstrations in crop growing carried on by farmers through contracts with the Government were continued.

Consult *Report of the Director of the Extension Service*, 1928, by C. W. Warburton (U. S. Department of Agriculture). *History of Agricultural Extension Work in the United States, 1785-1923*, by A. C. True (U. S. Department of Agriculture, Miscellaneous Publication 15, 1928).

AGRICULTURAL LEGISLATION. The question of attempting to relieve the agricultural situation in the United States by Federal legislation continued to be one of the major political issues in 1928, but at the end of the year the problem was still unsolved. The modified McNary-Haugen Bill to establish a Federal farm board to aid in the orderly marketing of agricultural commodities and in the control and disposition of surpluses, previously referred to (see 1927 YEAR BOOK, *Agricultural Legislation*), passed the Senate on April 12 by a vote of 53 to 23 and the House of Representatives on May 3 by a vote of 204 to 121. On May 23, however, the bill was vetoed by President Coolidge in a vigorous message of disapproval, in which he said in part: "It includes several provisions, which, if unencumbered by objectionable features, would form a basis for a measure that should do much to develop stronger business organizations in agriculture. But the present bill contains not only the so-called equalization fee and other features of the old measure prejudicial, in my opinion, to sound public policy and to agriculture, but also new and highly objectionable provisions. In its entirety it is little less undesirable than the earlier measure."

Among the weaknesses and perils ascribed by the President to the measure included its attempted fixing of prices; the retention of the so-called equalization fee, which he declared to be a sales tax upon the entire community; the widespread bureaucracy which he maintained would be set up; its encouragement to profiteering and wasteful distribution by middlemen; its eventual stimulation of overproduction; and the aid which sales abroad of surplus products at reduced prices would render to foreign competitors of American agriculture and industry.

The veto was considered by the Senate on May 25, and, with 50 votes to override and 31 in support of his position, the measure failed of repassage. The issues presented continued to be warmly discussed during the ensuing presidential campaign, with the platforms and candidates of both parties in apparent sympathy with the general principle of Federal relief. On December 4

in his annual message to Congress, President Coolidge put forward the following suggestions: "The Government should aid in promoting orderly marketing and in handling surpluses clearly due to weather and seasonal conditions. As a beginning there should be created a Federal farm board consisting of able and experienced men empowered to advise producers' associations in establishing central agencies or stabilization corporations to handle surpluses, to seek more economical means of merchandising, and to aid the producer in securing returns according to the quality of his product. A revolving loan fund should be provided for the necessary financing until these agencies shall have developed means of financing their operations through regularly constituted credit institutions."

A bill along these general lines, the principle of which subsequently received the endorsement of the Secretary of Agriculture, was introduced by Senator McNary on December 5. No action was taken by Congress prior to its recess on December 22, however, and at the close of the year there was some uncertainty as to whether legislation would be attempted in the few remaining weeks of the short session ending on Mar. 3, by the newly elected Congress.

Another matter long in controversy in which attempts were once more unsuccessful was that of the disposition of the Government's holdings at Muscle Shoals, Ala. This question had been of special interest to agriculture because of the proposed partial utilization of these holdings in fertilizer production. A measure providing for governmental operation of the Muscle Shoals plant was adopted by the Senate March 13 by a vote of 48 to 25 and by the House of Representatives on May 16 by a vote of 251 to 165. This measure was never signed by the President, however, but failed of enactment by a so-called "pocket veto."

Aside from the annual act making appropriations for the support of the Federal Department of Agriculture discussed elsewhere (see AGRICULTURE, UNITED STATES DEPARTMENT OF), the outstanding legislative accomplishment of 1928 was the passage of the Capper-Ketchum Act providing additional Federal aid for co-operative extension work in agriculture and home economics. This measure was signed by President Coolidge May 22, and was made immediately effective by an initial appropriation of \$980,000 for use during the fiscal year ending June 30, 1929. Under its provisions the 48 States and the Territory of Hawaii each are granted \$20,000 annually for the further development of the extension work with farm men, women, and children originally authorized by the Smith-Lever Act of 1914. This appropriation is increased by \$500,000 per annum in subsequent years, this amount being divided on an allotment basis whereby each State and Hawaii will receive from the fund an amount in proportion to the relation which their respective rural populations bear to the total rural population of the United States, and with the further condition that each makes available from State, Territorial, college, county, local, or individual sources a like amount to be used for the same purposes as the Federal funds. It is expected that these increased appropriations, which it is definitely provided must supplement and not replace existing resources, will permit of a more symmetrical expansion of the extension system, particularly as

regards the hitherto comparatively retarded work in home economics and with the boys' and girls' clubs.

The Standard Container Act of 1928, adopted May 1, 1928, established Federal standards for hampers, round stave baskets, and splint baskets for fruits and vegetables. The manufacture, sale, or use of non-standard containers was prohibited after Nov. 1, 1929. This law supplemented the Standard Container Act of 1916, which fixed standards for grape baskets, berry baskets, and small till baskets, and like it will be administered by the U. S. Department of Agriculture.

Outside the United States the most important legislation of the year was the Agricultural Credits Act of Great Britain approved by the King on August 3. This act was designed to improve the credit facilities of farmers as regards long-term loans for the purchase or improvement of agricultural land and short-term loans for ordinary trading purposes. No loans are to be made by the Government itself, the long-term loans being handled by an authorized agricultural mortgage corporation, and short-term credit being facilitated merely by empowering existing banks to accept as security for loans the farmer's livestock, implements, or crops. These items constitute the tenant farmer's main assets, and loans thereon will now be permitted under an arrangement whereby they become preferred claims, ranking second only to rents and taxes.

Another significant enactment was the New South Wales Primary Products Act. As amended in 1928, this act permits the establishment of marketing boards for most of the primary agricultural commodities by a majority vote of the producers of the commodity concerned. Once constituted, a board is given full control of the commodity, which may be exercised either by direct sales or by a regulation of distribution through existing channels by a system of licensing.

AGRICULTURAL WASTES, UTILIZATION. See AGRICULTURE.

AGRICULTURE. The position of agriculture and the farming people continued to command wide attention. In the United States it entered into the presidential campaign as it never had before. It was regarded by both parties as the most urgent economic problem of the nation, and promises of relief measures were freely made. While generalities were indulged in as previously, the form which these measures should take seemed to be crystallizing around the tariff, cheaper transportation, and the provision of a Federal farm board or commission to work out effective economic remedies. While the latter provision was regarded by some as an attempt to pass on the problem to another agency of supposedly superior wisdom, in detail the plan for such a board outlined by the successful candidate centred in the further development of co-operative marketing and the building up of farmer-owned and farmer-controlled stabilization corporations, with initial advances of capital from the Federal Government. Such a board would assist in the development of clearing houses for agricultural products and adequate warehousing facilities, the elimination of waste in distribution, and the solution of other problems as they arise.

One marked step in advance was the broader

realization that agriculture is not a single industry but an aggregation of specialized industries largely independent in their economic relationships; hence depression in different branches of farming comes from widely different sources and causes. Less faith was felt in the efficacy of any single legislative measure as a general panacea, but realization became more widespread that sound and permanent relief can only come through complete determination of the causes, which will lead to solution through various lines of action. See AGRICULTURAL LEGISLATION.

THE AGRICULTURAL SITUATION. Inquiries into the nature of the agricultural situation, the reason of disparity between that industry and other industries in a period of general prosperity, and closer study of various manifestations and causes of the general problem continued to receive attention by numerous agencies, including chambers of commerce, banking associations, and business interests, as well as economists, publicists, and agricultural experts. The fundamental relation of agriculture and business was emphasized by agencies representing commercial interests; and attention was called to the changes which had taken place in recent years with increased efficiency of agricultural production, the extension of farming to new areas, and the altered relation of American agriculture to world markets.

The United States Chamber of Commerce submitted a referendum on agriculture to its member organizations with seven recommendations, including strict coördination of the land reclamation and reforestation policies of the Federal Government, delay in bringing additional areas into agricultural production at public expense until economically needed, reasonable protection for the branches of agriculture subject to destructive foreign competition, support of co-operative marketing, development and adaptation of agricultural credit facilities, the creation of a Federal farm board to consider the problems peculiar to agriculture, and adequate appropriations for continuing economic and scientific agricultural research.

The complexity of the cause of agricultural depression was brought out at the convention of the American Bankers' Association in October. A basic difficulty was described as a lack of adjustment between what is produced and what is consumed. Not only overproduction but underconsumption is instrumental in producing an unwieldy surplus. This suggests the importance of new uses of products of the soil and avoidance of wastes. Future success of the farmer was declared to lie in improving his labor income, rather than in the unearned increment due to the advance in value of his farm lands. Tax relief through adjustments, basing taxation systems on ability to pay, the recognition that capital values of the farm must reflect earning power rather than inflated prices for real estate, and the transfer of a larger proportion of real estate taxes to other types of taxation were measures strongly stressed.

The question of more equitable farm taxes was receiving increased attention. Various studies have been made by the Federal Department of Agriculture and the experiment stations in the States, often in collaboration with constituted State taxation agencies, with re-

sults which have been received with a high degree of favorable public interest. Certain of these inquiries have demonstrated that taxes on agricultural property are greater in proportion to income than on other property. Relief, where undertaken, has come through widening the base of taxation for schools and road purposes, and tapping new sources of revenue to supplement the general property tax. Since the farmers' tax problem is essentially a State and local one rather than a Federal problem, remedial action must come from those sources.

With reference to the importance of the tariff to agriculture, it was pointed out that one-third of the total agricultural production of the United States meets the products of foreign competitors in our own markets. The Department of Agriculture showed that in the calendar year 1924 no less than 45 per cent of the imports of dutiable articles consisted of essentially competitive agricultural products. The relationship of agriculture to world markets in 1928 was quite different from what it formerly was. Thirty years previous, about 27 per cent of the total value of the agricultural output entered the export trade, as against 15 per cent during recent years; hence in the earlier period agricultural commodities exported had their prices determined in the world market, and consequently less influenced by the tariff. With agricultural exports decreasing in proportion to total exports as well as to total agricultural output, and with imports of agricultural products offering increased competition in the home market, the relation of agriculture to the tariff was materially changed.

Improvement of agriculture, in the opinion of the Secretary of Agriculture, necessitated a combination of individual efficiency, co-operative enterprise, and wise public policy. Many of the fundamental principles that make for success in industry and trade can be applied to agriculture. In his judgment it is necessary to reduce wastes in production and distribution, to expand markets, to find new uses for agricultural products, to organize producers for greater bargaining power, and to invoke government aid in research and in the maintenance or creation of favorable market conditions. Legislation is considered essential for the control of recurring surpluses of farm products, so as to minimize price fluctuations. It is argued that the vital importance of the surplus problem, not only to agriculture but the nation as a whole, makes its solution in some measure a proper governmental responsibility.

A survey by the Department of Agriculture in March, 1928, showed that farm real estate values were only 17 per cent above the pre-war level, compared with 57 per cent above that level in 1921. Taking into account the changes in the purchasing power of the dollar, farm real estate values as a whole were about 20 per cent below the position they held fifteen years before. This decline in values was regarded as an important factor in the depression, especially in the case of those who purchased lands at high values, since real estate comprises more than four-fifths of the average farmer's capital investment and provides the security for most of his borrowings. The decline in values in 1927 was less than in the immediately preceding years.

As a measure of the purchasing power of

farm products in terms of retail prices which the farmers pay, the Department of Agriculture showed that in September the index of retail prices paid by farmers stood at approximately 157 compared with 100 before the World War. Prices received by farmers in that month were 141 per cent of pre-war averages, these two price levels indicating a relative purchasing power of farm products of 90, with 100 representing the base period 1910 to 1914. The corresponding figure for 1921 dropped to 75 and, with some fluctuations, has since shown a general increase. This figure does not take account of farm taxes which are about 250 per cent of the pre-war level, and of farm wages which are 170 per cent of that level.

One remedy for the agricultural situation advanced in some quarters, and with considerable plausibility, was the extension of corporation farming, or farming on a large industrial scale. In advocacy of this, cases were cited in the West where production cost had been reduced by wheat growing on large areas with extensive use of machinery, and of large-scale operations elsewhere in other lines of production. While opportunity exists for expansion of corporation farming under certain conditions, this is not regarded with favor as advantageous to agriculture or as a remedy for agricultural depression. Instead, those who look upon agriculture as a mode of life as well as a business urge that farming is and must continue to be an individualistic business of small units and independent ownership. To that end farms of proper size for the individual farmer are advocated as the aim, and the independence of the farmer thus maintained.

PRODUCTION IN 1928. The year was marked by notable, though not uniform, improvements. The situation with respect to crops was less uneven than in any year since 1920; at least there were fewer distress areas. The gross income from all agricultural products was estimated to be somewhat larger than in the preceding year. The increase in values was due chiefly to improvement in the livestock industries, which prospered conspicuously. Returns from cash grain, hay, tobacco, and potatoes were expected to be smaller than in 1927; but as the Secretary of Agriculture declared, "It is clear that the year will carry forward the story of recovery from the effects of the post-war depression." Many branches of the agricultural industry continued to make gains in the efficiency of production and likewise in the adjustment of supply to demand.

The season was one of relative heavy production despite hampering weather conditions in some areas. The acreage of crops harvested was the largest on record, exceeding that of 1927 by 8,000,000 acres, or 2.4 per cent, the increase being larger than that of any year since 1918. The increase was quite well distributed throughout the country, and was divided among cotton, spring wheat, potatoes, and other leading crops. A decline, representing a shift to more intensive crops, took place in the acreage previously devoted to hay.

The wheat production was the largest since 1919, amounting to over 900,000,000 bushels. The increase was mostly in hard winter and durum wheat. Sharp changes in temperature in the spring destroyed the winter wheat seeded in fully 10,000,000 acres and thinned the stand

on a large additional acreage. Reseeding was complicated by a cold and wet June. The indications were that the world's supply of wheat for the 1928-29 marketing season would be about 5 per cent greater than in the 1927-28 season. Canada, the most important competitor of the United States in wheat, had a record crop. Europe outside of Russia had a crop somewhat larger and of better quality than in 1927. Turkey and northern China had short wheat crops. It was expected that the increase in the world's supply would be considerably offset by an increase in demand, consumption in Europe being stimulated by a relatively low price and by the shortage of the corn crop in southern Europe.

The corn crop of nearly 2,900,000 bushels was the largest crop since 1923. The acreage was a little larger than that harvested in 1927, and the yields averaged slightly better, although in some important corn-raising States the yields were disappointing. The acreage occupied by corn was by far the largest devoted to any single crop, amounting in 1928 to more than 100,000,000 acres, nearly equal to the combined area of the principal cereal crops. A scarcity of corn and other feedstuffs in Europe was a factor in maintaining relatively good prices for corn through the season of 1925 and was likely to be in 1929. In some of the southern European countries the crop was smaller than in 1927, which would leave no export surplus and might require imports to meet domestic requirements. Argentina was the greatest competitor in corn markets, selling not only in Europe, but in the port markets of the United States. Production in that country amounted to 306,000,000 bushels in 1927 compared with a pre-war average of 192,000,000. Most of the corn crop is placed on the market, relatively little being fed or used otherwise locally.

The rye crop was considerably less than in 1927, the estimate being a little less than 42,000,000 bushels compared with 58,164,000 bushels in 1927. The crop was the lowest for many years, except in 1926, when it amounted to 40,795,000 bushels. Russia's rye crop was short, which doubtless would lead to the import of more wheat than during the preceding year. Oat production, which is the largest of any of the cereal grains, was the highest since 1924, and considerably above the average. The crop amounted to nearly one and a half billion bushels compared with 1,182,594,000 bushels in 1927. Barley was a record crop for acreage and production, much above the average in both respects. The crop was estimated at 356,868,000 bushels, or about 91,000,000 bushels more than in 1927. Rice and buckwheat produced average crops, although lower than in 1927, but the flaxseed crop was below the average. Hay (tame) was considerably below the production in 1927, which was a record crop.

The crop of white potatoes was a record one, much above the average. It was estimated at 462,943,000 bushels, or approximately 60,000,000 bushels more than in 1927. The increase was partly due to expansion of acreage and partly to higher yield. The lower price served to give the farm value of the crop a total far below that of 1927. It was expected that fully 15 per cent of the potato crop would be utilized as feed for livestock or wasted. The tobacco crop was well up to the average, with a production

of 1,373,500,000 pounds, a notable increase over 1927. Prices, however, were not as good, which gave the crop a farm value somewhat less than the previous year. Exports of flue-cured tobacco increased 14 per cent over those of the preceding year. The United Kingdom and China, the leading markets for this type of tobacco, took substantially large quantities and the exports of cigarettes to China increased. The increased use of cigarettes and the limited foreign production of similar tobacco had placed the American flue-cured tobacco in a favorable position. Shipments of darker pipe and chewing tobaccos which meet increased foreign competition were reduced.

Cotton was planted on an increased acreage of over 11 per cent compared with the previous year, which made the 1928 area in that crop only 4 per cent below the record acreage of 1926. Losses from the boll weevil, however, were the heaviest since the first few years after that pest spread throughout the Cotton Belt, and weather conditions were unfavorable to the crop. In consequence, the production was estimated at about 14,373,000 bales compared with 17,977,000 bales in 1926. The relatively small crop in 1927 of 12,955,000 bales was held down by acreage reduction, boll weevil, and the Mississippi floods. With the exception of 1925 and 1926, the cotton production of 1928 had rarely been exceeded. Cotton exports in the fiscal year 1927-28 declined 30 per cent in volume, although in value the decline amounted to only 5 per cent. This was a reflection of the higher price prevailing in that year. See also articles on individual crops.

AGRICULTURE IN EUROPE—GREAT BRITAIN. The condition of agriculture in Great Britain continued to be distressed and a source of much discussion. Sir Daniel Hall, writing in *The Journal of the Ministry of Agriculture*, declared the condition to be fully as bad as in the late eighties and the early nineties of the last century. Others referred to the plight of farmers of cultivated land and their laborers as well nigh desperate. The acreage of plowed land in England and Wales in 1928 was reported as less than in 1914 by nearly 900,000 acres, and the trend of grain prices was expected still further to reduce the area, the land being put into grass. Scotland also reports a decline in agriculture and in the agricultural population. On the other hand, some persons close to the industry are inclined to regard the situation as less gloomy than at any time since the War, and that those who have survived the depression may expect greater stability.

RUSSIA. It was announced in June that under a ruling of the Russian Government, necessitated by the shortage of wheat available for export, Moscow bakeries would sell only semidark bread, wheat flour being no longer sold to the public. Although the grain crop in 1928 reached pre-war figures, Soviet Russia's production of marketable grain and that available for export fell far below that previous to the War. This was attributed to the passing of the large estates which before the revolution produced the bulk of Russia's wheat exports. The small individual farms now yield only 11 per cent of grain fit for the market.

ITALY. In Italy agriculture received a great stimulus through the attitude of Premier Mussolini, who announced that the Government's policy henceforth would give first place to agri-

culture. He recognized that Italian farmers had faced exceptional hardships, and declared that he would do everything possible to enhance the well-being of the rural people. Provision was made by the Ministry of National Economy for the granting of loans to Italian farmers on warehouse grain receipts. The general scheme for the loans was about two-thirds the value of the grain at current prices.

INDIA. A Royal Commission on Agriculture in India made a report of some 900 pages during the year, reviewing the situation in its various aspects.

Statistics showing the crops of various countries as far as available are given in the accompanying table.

UTILIZING AGRICULTURAL WASTES. This subject received much attention of late, particularly during the past year. The Federal Department of Agriculture made an extensive survey of the extent of such waste materials and the possibilities of their utilization, and is carrying on research in that field. According to Dr. H. G. Knight, of the Bureau of Chemistry and Soils, "there is an annual production in the United States of about 100,000,000 tons of cornstalks, 115,000,000 tons of cereal straws, 20,000,000 tons of corncobs, 3,000,000 tons of oat hulls, 18,000,000 tons of cotton stalks, 1,800,000 tons of cottonseed hulls, 2,200,000 tons of flax straw, 70,000 tons of peanut hulls, and 500,000 tons of sugar-cane bagasse, making a grand total of 260,570,000 tons of agricultural wastes and residues for which little use has been found." The success thus far attained in converting the residues and surplus of the corn crop into starch, glucose, ethyl alcohol, butyl alcohol, acetone, and other products is encouraging, and manufacture of fibre-board from sugar-cane bagasse is a further example of successful conversion of farm wastes into commercial products on a large scale.

The first carload of wall board made from cornstalks was shipped by a firm from Dubuque, Iowa, in November. Farmers received around \$5 per ton besides the cost of harvesting and baling. Orders were reported for large quantities of the wall board. Copies of the first book to be printed on paper made from cornstalks appeared the latter part of the year. It was entitled *Farm Products in Industry*, and reported an extended survey into the industrial utilization of farm products. An agricultural journal in the Central West printed its 260,000-copy edition of December 15 on paper made from cornstalks.

This matter commanded large attention at the Institute of Chemistry of the American Chemical Society, held at Northwestern University during the summer, and at other meetings. These waste materials were declared to contain an amount of vegetable fibre adequate to supply a large proportion of the requirements for paper stock, and from this purified cellulose the whole range of products based on cellulose compounds can be made. The question of profitable utilization is being investigated from many sides.

AGRICULTURAL COÖPERATION. The United States Department of Agriculture listed 11,400 active farmers' coöperative associations. These in the 1927 marketing season transacted business to the amount of \$2,300,000,000. This figure was less by \$100,000,000 than the total business of a somewhat smaller number of associations in

PRODUCTION BY COUNTRIES IN 1927 AND 1928 OF WHEAT, RYE, OATS, BARLEY, AND MAIZE IN BUSHELS

^a The production given for countries of the southern hemisphere is for the crop years 1927-28 and 1926-27.

1925, accounted for by lower prices of products bought and sold.

The largest amount of business done by any one group was by the associations handling grain, amounting to \$680,000,000. The associations marketing dairy products had a total business of \$620,000,000; livestock associations, \$320,000,000; fruit and vegetable associations, \$300,000,000; cotton-marketing associations, \$97,000,000; poultry and egg associations, \$40,000,000; nut-marketing associations, \$14,600,000; tobacco associations, \$22,000,000; the associations handling wool, \$7,000,000; and others selling and buying various products, nearly \$200,000,000. The associations handling dairy products and shipping livestock had made enormous strides since 1915, and those handling grain, fruits, and vegetables had gained from 50 to 100 per cent. The largest business in 1927 was done by California associations, \$226,320,000, more than half of which related to fruit and vegetable associations.

These coöperative organizations included a membership of 3,000,000 members, shareholders, shippers, consignors, and patrons, an increase of 300,000 over 1925. Between 25 and 30 large-scale farmers' coöperative buying associations were listed. These served more than a quarter-million farmers in 1927 and purchased supplies for their patrons to the value of \$60,000,000.

While the progress in the coöperative organization of farmers had not been uniform, and there had been setbacks as well as advances, there had been a remarkable net gain, the value of which is not estimated wholly in terms of business done, membership gained, or savings effected. One important product had been a widespread realization among farmers that success in agriculture required efficient selling as well as efficient production. Coöperative marketing aims to give the farmer an efficient and economical marketing system, while at the same time promoting the adjustment of production to market needs. It is a large influence in the standardization, handling, packing, and processing of farm commodities.

The fourth summer session of the American Institute of Coöperation was held at the University of California in July. Over 100 leaders in the coöperative movement in agriculture, representing 26 States and 6 foreign countries, were registered.

A Division of Agricultural Coöperation was established in the Pan American Union, to advance coöperation and research in the member countries of the Union. See COÖPERATION.

INTERNATIONAL INSTITUTE OF AGRICULTURE. The General Assembly of the Institute was held at the headquarters in Rome. Resolutions were passed looking toward a larger measure of international control and a greater degree of centralization of administration, which were thought to favor greater efficiency in the operation of the Institute. The administration was directed to put greater emphasis on collecting and transmitting by cable statistics on crops and livestock and livestock products, and to promote the use of standard methods in collecting statistics in the various countries. The development of standard index number of prices, production, factors of expense, and net income was provided for. The standard schedule was agreed upon to be used in taking the world census of agriculture in 1930, arrangements for which

have been practically completed. The countries which have promised active participation represent approximately 98 per cent of the agriculture of the world, according to Leon M. Estabrook, director of the census for the Institute.

AGRICULTURE, UNITED STATES DEPARTMENT OF. Dr. William Marion Jardine of Kansas continued to be Secretary of Agriculture during 1928, with Renick W. Dunlap as Assistant Secretary. Lloyd S. Tenney, Chief of the Bureau of Agricultural Economics, was succeeded by Nils A. Olsen. O. E. Reed became Chief of the Bureau of Dairy Industry September 1, 1928. A Plant Quarantine and Control Administration with Dr. C. L. Marlatt as chief, was established July 1, 1928, to bring together the regulatory and control work relating to plants and plant products heretofore conducted by the Federal Horticultural Board and the Bureaus of Entomology and Plant Industry.

On June 30, 1928, the personnel of the department was 22,189, of whom 4,902 were located in Washington. Under the Welch Act the average salary of permanent employees in Washington became \$2292, an increase of \$240. The average salary in the professional and scientific grades was \$3894, an increase of over \$500. During the year ended June 30, 1928, 101 employees were retired on an average annuity of \$807. Between 1921 and 1927 the average annual leave of employees in Washington was 26.9 days and the sick leave was 7.4 days. The new administration building between the existing wings on the department grounds was under construction.

The report of the secretary for 1928 dealt to a considerable extent with the economic problems of agriculture in the United States, including agricultural relief, the tariff, taxation, credit facilities, and coöperative farm organizations.

AGRICULTURAL RELIEF. In the judgment of the Secretary, "the betterment of agriculture necessitates a combination of individual efficiency, coöperative enterprise, and wise public policy." Since the surplus problem is of vital importance to the nation as well as to agriculture, it is proper to make its solution in some measure a governmental responsibility. But the Government need not go further than it has in aiding other economic interests. "No law dealing with this question would be entirely adequate at first." As an initial step it would be well to create a Federal farm board with adequate authority to finance the surpluses through central stabilization corporations provided with a revolving fund. Advisory councils responsible to the farmers should be created. Indirect government assistance can do much. Farmers and business men may coöperate in promoting standardization of agricultural products. The extensive economic data regularly published by the department should be utilized. Facilities should be created for encouraging quality production by cash rewards in prices at the farm.

COÖPERATIVE MARKETING. Coöperative organizations among farmers, which now do a large business, have not only given better financial returns in many cases but have also caused "a widespread realization among farmers that success in agriculture requires efficient selling as well as efficient production." Five or six associations have an annual business approximating \$50,000,000 each and two have passed the \$80,-

000,000 mark. The secretary pointed out that "when markets are depressed by overproduction it is difficult even for the most efficient coöperative organizations to obtain satisfactory prices." Cotton marketing coöperatives have benefited cotton farmers generally by developing a system of payment for cotton on the basis of its grade and staple. Local elevator associations continued to be the chief factors in coöperative marketing among grain farmers. State-wide pools thus far have handled comparatively small quantities of grain. Coöperative terminal-market agencies have greatly strengthened the marketing position of livestock producers. Twenty-five such agencies operating in 19 markets did business in 1927 amounting to \$267,200,000. Producers of dairy products have operated some of the most effective coöperative organizations, which have increased the consumption of milk by advertising and educational campaigns and by insisting on quality production. The movement among fruit and vegetable growers for the federation of local associations and the formation of over-head sales agencies continued to grow.

ROADS. During the fiscal year ended June 30, 1928, 8130 miles of roads and 54 miles of major bridges were completed under the Federal Road Act of Nov. 9, 1921, making a total of 71,074. The total cost of the projects completed during the year was \$205,043,784 of which \$38,056,984 was paid by the Federal Government. The total Federal aid funds apportioned to the States during 12 years was approximately \$836,125,000. With Federal funds of the Bureau of Public Roads 281 miles of forest roads were completed during the fiscal year 1928, making the total 3775.

EXPENDITURES. For the fiscal year 1928 the total expenditure for the regular work of the department was \$47,807,894. Approximately \$11,300,000 was used for research; \$2,400,000 for extension work; \$10,200,000 for eradication or control of plant and animal diseases, insects and other pests; \$13,700,000 for service activities, and \$10,200,000 for regulatory work. Funds amounting to \$8,558,378 were received and deposited in the Treasury, of which \$4,900,922 was from business in the National forests. The other funds administered by the department aggregated \$106,595,052, of which \$90,417,534 was for Federal-aided roads and forest roads and trails; \$3,360,000 for experiment stations under the Hatch, Adams, and Purnell acts; \$5,880,000 for extension work under the Smith-Lever Act; \$1,311,415 for local road and school purposes; and \$1,995,195 for forest purchase and conservation under the Weeks Act.

APPROPRIATIONS. The Appropriation Act of 1928, for the fiscal year ending June 30, 1929, carried \$139,138,793, of which \$83,697,294 was for roads, \$6,805,500 was Forest Service and wild-life conservation funds, partly redistributed among the States, and \$10,980,000 was for payments to the agricultural colleges and experiment stations under the terms of several Federal acts. The amount available for the regular work of the department was \$61,054,239. To this must be added permanent appropriations, including \$4,580,000 for extension work under the Smith-Lever Act, \$3,000,000 for meat inspection, and \$3,430,500 for various forestry purposes, together with \$4,574,000 supplementary funds carried in the Second Deficiency Appropriation Act of May 29, 1928, and \$313,239 available from re-

appropriation of balances. The total available for the department was \$155,037,033.

PUBLICATIONS. For the fiscal year 1928 the department issued 591 new publications, 194 numbers of 8 periodicals, and 585 reprints. The total copies of publications distributed were 33,716,481, of which 13,152,367 were Farmers' Bulletins. The Year Book for 1927 followed the plan adopted the previous year and contained a large number of short articles covering a wide range of subjects, under the title "What's New in Agriculture," together with statistics of crops, livestock, animal products, dairy products, poultry, imports and exports, farm prices, farm income, cost of production, farm wages, etc.

The department library contained about 205,000 volumes. About 15,800 books, pamphlets, and bound volumes were added during 1928, and the current issues of more than 3400 periodicals were received.

RADIO SERVICE. The educational programmes of the department were broadcast in 1928 from 149 stations, which gave over 1000 hours each month to this service. By an arrangement with the National Broadcasting Company, members of the department staff gave important current information to 400,000 farm families each week day except Saturday. The programmes included Aunt Sammy's housekeepers' chat, noontime farm flashes, poultry chats, insect and wild animal allies and enemies, farm news digest, young folks' programme, primer for town farmers, and the United States radio farm school.

AIRCRAFT CARRIER. See NAVAL PROGRESS.

AIRSHIPS. See AERONAUTICS; NAVAL PROGRESS.

ALABAMA. POPULATION. According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 2,348,174. The estimated population on July 1, 1928, was 2,573,000. The capital is Montgomery.

AGRICULTURE. The following table gives the acreage, production, and value of the principal crops in 1927 and 1928:

Crop	Year	Acreage	Prod. bu.	Value
Corn	1928	2,650,000	30,475,000	\$38,522,000
	1927	2,800,000	44,800,000	41,216,000
Cotton	1928	3,595,000	1,090,000 *	99,190,000
	1927	3,214,000	1,191,000 *	113,145,000
Hay	1928	637,000	489,000 b	7,703,000
	1927	637,000	533,000 b	7,961,000
Sweet potatoes	1928	70,000	6,510,000	5,859,000
	1927	78,000	7,644,000	6,497,000
Potatoes	1928	38,000	2,812,000	2,890,000
	1927	33,000	2,475,000	3,712,000
Peanuts	1928	210,000	117,600,000 *	4,585,000
	1927	230,000	156,400,000 *	5,318,000
Oats	1928	70,000	1,225,000	919,000
	1927	101,000	1,768,000	1,238,000

* bales, b tons, c pounds.

MINERAL PRODUCTION. The leading mineral products of the State are, in their order, coal, iron ore, cement, and clay products. Coal production, from 21,000.962 short tons in 1926, fell somewhat, to 19,765,866 in 1927; The total value of coal produced was, for 1928, \$48,036,000, and for 1927, \$44,524,000. There was shipped, of iron ore, a total of 6,508,419 long tons in 1927, as against 6,871,412 in 1926; in value, \$12,973,597 for 1927 and \$13,846,656 for 1926. Blast furnace shipments of pig iron attained 2,706,240 long tons for 1927; for 1926 they had been 2,875,534. Their value was, for

1927, \$50,193,057; for 1926, \$58,119,260. Coke production amounted to 4,330,000 short tons in 1927; in 1926 it was 4,779,986 short tons, valued at \$16,823,492. These figures represent the output of by-product ovens; there was in addition a minor production of beehive coke. Of cement there were shipped 7,313,494 barrels in 1927; in 1926, 6,693,900. Shipments were, in value, \$10,615,428 in 1927; \$10,825,421 in 1926. Clay products totaled \$4,181,571 in 1926, \$4,987,896 in 1925. Other mineral products were graphite, sand, gravel, and stone. The aggregate value of mineral production was \$83,709,894 for 1926; for 1925, \$77,139,340.

FINANCE. State expenditures in the year ending September 30, 1927, as reported by the United States Department of Commerce, were: for maintenance and operation of departments, \$16,197,071 (of which \$4,428,505 was for educational purposes); for interest on debt, \$1,673,520; for permanent improvements, \$12,005,632; total, \$29,944,408 (of which \$9,140,645 was for highways, \$741,659 being for maintenance and \$8,398,986 for construction).

Revenues were \$21,999,125, of which property and special taxes provided 38.9 per cent; State departments' earnings, 16.6 per cent; licenses, coal and ore tonnage taxes, and gasoline taxes, 31.6 per cent. Property valuation was \$1,121,993,430; State taxation thereon, \$7,292,957.

Net funded State debt, Sept. 30, 1927, was \$41,554,136.

TRANSPORTATION. The total mileage of railroad line under operation Jan. 1, 1928 was 5185.15. There were built in 1928 123.56 miles of first track.

EDUCATION. Additional school revenues under the State appropriations made in 1927 were expended in various ways, chiefly in the lengthening of the school term in schools in which it had been too brief and for increasing teachers' compensation. State Superintendent R. E. Tidwell, commenting in the *Journal* of the National Education Association drew attention to improved facilities for teacher training in the colleges and normal schools of the State. The school population of Alabama as of Sept. 30, 1928, was put at 886,746, consisting of 557,600 white and 329,146 colored persons. There were enrolled in the public schools of the State in the academic year 1926-27, 412,817 white and 184,438 colored pupils; total, 597,255. Of these, 317,618 white and 172,246 colored, or 489,864, were in the elementary schools. In the high schools were enrolled 95,199 white and 12,192 colored; in all, 107,391 pupils. Expenditure in 1926-27 for public-school education in the State was given as: for whites, \$16,677,147; for colored, \$1,613,239; total, \$18,290,386.

CHARITIES AND CORRECTIONS. The State Board of Administration, constituted according to the code of 1923, acted in 1928 as the central State agency in the field of welfare activities. It included a convict department. The convict leasing system, which had been under its supervision, came to an end in 1928. The institutions of the State included in 1928 the Alabama Reform School for Juvenile Negro Law Breakers; Alabama Vocational School for Girls, at Birmingham; Jefferson Manley Faulkner Soldiers' Home, Mountain Creek; Alabama School of Trades and Industries, Gadsden; Alabama School for the Deaf, Talladega; Bryce Hospital (white insane), Tuscaloosa; Searcy Hospital (colored insane),

Mount Vernon; Partlow State School (mental defectives); State Training School for Girls, Pinson; Alabama Boys' Industrial School, Birmingham; Industrial School for White Blind Men, Birmingham. The two insane hospitals of the State were under one self-perpetuating board of trustees.

POLITICAL AND OTHER EVENTS. A number of important industrial enterprises were established or projected in the course of 1928 at various points in the State. A mill of the International Paper Company, to cost some \$5,000,000 was planned, to occupy a \$100,000 site at Mobile, furnished by local interests. At the Fairfield works of the Tennessee Coal and Iron Company were placed in operation blast furnaces with conveying apparatus to carry the molten metal direct to the steel mill. Arrangements were made for the construction of a number of cotton mills under one large company, the Alabama Mills Company; these to comprise eventually 10 mills with 100,000 spindles in all, situated in towns all save one within a radius of 85 miles of Birmingham. Construction was begun by another company on a \$3,000,000 cotton mill near Talladega, and at Huntsville work on a new mill unit, involving a \$2,300,000 building programme, was started.

At Mobile, the \$10,000,000 public tidewater terminal built by the State Dock Commission was formally opened on June 25. It comprised an extensive system of modern piers and warehouses occupying a site of 550 acres of former marsh land. Railroad development in the State moved forward with the opening in June of the St. Louis and San Francisco system's direct route between Kansas City and Pensacola, via Birmingham. This route used the line graded shortly after the Civil War by General Forrest, from Birmingham to Meridian, Miss., and left for many years unfinished. The State began in the course of the year the establishment of eight of the eleven State farms authorized by the Legislature of 1927, to operate in connection with agricultural high schools. The organization of a School of Medicine providing a four-year course at the State University was started, and Dr. Stuart Graves, former Dean of the Medical School of the University of Louisville, was appointed its head.

The Bridge Bond Act of the legislature of 1927, authorizing a \$5,000,000 bond issue by a State corporation, the Alabama Bridge Corporation, for the construction of some 15 bridges, the cost to be refunded out of toll payments, was sustained March 21 by a decision of the Alabama Supreme Court. The city of Birmingham voted favorably March 26 on the proposal to issue bonds for a programme of grade crossing elimination to be carried out in coöperation with the railroads. With regard to State taxation, a decision of the State Supreme Court, rendered June 14, in a suit brought by the Standard Oil Company of Indiana, held that the gasoline tax act of 1923 had automatically repealed the 1½-cent wholesale gasoline tax of 1919, and thus gave occasion to wholesalers' refund claims of several hundred thousand dollars. The Court held constitutional, May 9, the State tax on cigars and cigarettes. The city of Birmingham, in a special election held April 24, defeated by a vote of 12,441 to 9148 a proposal to permit the exhibition of moving pictures on Sundays.

The abolition of the State convict leasing system was completed at the end of June, by the withdrawal of some 800 convict miners from work in coal mines under State contract, and of about 200 convicts from work in lumber camps; the convicts were transferred to State road work.

ELECTION. At the Democratic primary on May 8 were nominated ten Representatives, a chief justice and two associate justices of the State Supreme Court, three justices of the Court of Appeals, and a president of the State public service commission. As usual, the primary result was tantamount to election, and on November 6 the entire Democratic ticket of the State was elected. In Alabama as in other Southern States, there was strong opposition to the Democratic Presidential candidate, Gov. Alfred E. Smith of New York, but Smith for President and Robinson for Vice President carried the State, though by a majority less than the Democratic majority of 1924. The popular vote of the State for President as finally announced was: Smith (Democratic), 127,796; Hoover (Republican), 120,725.

OFFICERS. Governor, Bibb Graves; Lieutenant-Governor, W. C. Davis; Secretary of State, John M. Brandon; Treasurer, W. B. Allgood; Auditor, Sidney H. Blan; State Superintendent of Education, R. E. Tidwell; Attorney-General, Charles C. McCall; Commissioner of Agriculture and Industries, S. M. Dunwoody.

JUDICIARY. Supreme Court: Chief Justice, John C. Anderson; Associate Justices, William H. Thomas, A. D. Sayre, Ormond Somerville, Lucien D. Gardner, Virgil Bouldin, and Joel B. Brown.

ALABAMA, UNIVERSITY OF. A coeducational State institution for higher learning at University, Ala.; founded in 1831. For the autumn term of 1928 the enrollment was 3001, distributed as follows: arts and science, 1481; engineering, 365; law, 115; medicine, 107; graduate, 65; education, 248; and commerce, 619. The summer school registration was 1873. The faculty for 1928-29 numbered 136, of whom 36 were newly appointed. The productive funds of the University amounted to \$1,857,988, and the income for the year was \$992,406. The library contained about 75,000 volumes, of which 20,000 were government documents. A new commerce building was completed during the year at a cost of \$200,000; and a women's building (for art, music, and home economics), costing \$175,000, and an education building were under construction. President, George H. Denny, Ph.D., LL.D.

ALASKA. A Territory of the United States and its largest possession, forming a jutting land mass at the northwestern extremity of North America. Its total area is 586,400 square miles. The capital is Juneau.

According to the annual report of Gov. George A. Parks, the Territory of Alaska was in a satisfactory economic and industrial condition in the fiscal year 1928, employment was general, and no serious epidemics occurred. The Territory had in 1928, 17 incorporated towns. The assessed property valuation of 16 of these was \$22,690,686.

AGRICULTURE. Cultivation was most active in 1927-28 in the Alaska Railroad territory and in southwestern Alaska. A creamery at Curry, the midpoint of the railroad, promoted dairying activity in the Matanuska and Tanana valleys.

The Matanuska Valley climate, described as similar to that of the Dakotas, encouraged dairy methods such as those there used, including winter housing in barns and the raising of pea and oat silage. Oats were likewise raised as a grain crop. Most of the farmers in the valley, as they lived within five miles of the railroad and were served by wagon and automobile roads, had little transportation difficulty. They had an abundance of summer pasture. It was found essential to heat dairy barns artificially in spells of extreme winter cold. The Tanana Valley began regular dairy shipments only in 1928. It was reported that in southwestern Alaska a number of companies had been formed to raise cattle and sheep, chiefly on the Aleutian Peninsula and Islands. While summer pasture abounded, and while some of the ventures had succeeded, the lack of winter feed and of transportation to markets had limited the development in this section.

MINERAL PRODUCTION. The total mineral production of the territory for the year 1927 was, in value \$14,404,000, as compared with \$17,664,800 for 1926. The decline was chiefly in copper production, but that of gold also fell off. Gold was mined in 1927 to the value of \$5,927,000; in 1926, to that of \$6,707,000. The mine production of copper in 1927 was \$7,250,000, approximately, as compared with \$9,489,000 for 1926. The copper total was affected by lower prices for the metal and was not simply a matter of smaller output. The decrease in gold output occurred entirely in placer production, while the product of the lode mines rose slightly. The copper mines produced, in quantity, 645,000 tons of ore, which yielded 55,343,000 (estimated) pounds of metal, as against 67,631,846 pounds for 1926. The above estimate appeared in the governor's report, but that of the United States Bureau of Mines, slightly higher, was 56,489,214 pounds produced in 1927. The petroleum production of the Katalla field continued in 1927, and that field remained the only producer in the Territory. The yield for 1926 was 7600 barrels. The production of coal, which had been 87,300 short tons, in value \$459,000 for 1926, rose in 1927, attaining for that year 104,300 tons, valued at \$548,000. For the first time in many years Alaska produced in 1927 more than half of the coal that it consumed, the consumption in that year being estimated at 166,000 tons.

FINANCE. There exist in the Territory two systems of public finance, that of the Territory itself and that of the Federal Government; the territorial fiscal system is controlled by the laws of the Alaskan Legislature. The Territorial Treasury showed on January 1, 1927, a cash balance of \$614,010.07; total receipts in the course of the calendar year 1927 were \$1,379,792.20; the disbursements under legislative appropriations totaled \$1,221,743.68. There remained at the end of the year a cash balance of \$772,058.59.

The Federal Government revenue receipts in the Territory, derived from sale of business and trade licenses outside incorporated towns, and credited to the Alaska Fund, amounted in the fiscal year 1928 to \$161,138.46, and showed a sharp decrease from \$256,712.51, the corresponding total for the fiscal year 1927. The Fund was available, in the proportion of 65 per cent for road and trail construction and repair, 25 per cent for schools (both activities outside incor-

porated towns), and 10 per cent for indigent relief.

TRANSPORTATION. *Alaska Railroad.* The Government, which owns and operates the railroad system, has considerably reduced the yearly operating deficit. This deficit in the fiscal year 1927 ran for the first time below \$1,000,000, and for 1928 the deficit was 840,890. There was an increase of 17.7 per cent in the commercial freight tonnage, to 96,977 tons. The number of paying passengers carried decreased slightly. Revenue from transportation was \$1,551,723.86. Of nearly \$12,000,000 of construction estimated in 1925 as necessary to complete the railroad as projected, there had been spent up to the end of the fiscal year 1928 but \$2,435,784. Additions were made in the course of the year to the gasoline-driven equipment for the railroad.

Roads and Trails. The Alaska Roads Commission reported at the end of the fiscal year 1928 that it had 10,754 miles of roads and trails under supervision. Of these, 1623 miles were wagon roads. There were constructed during the year 67¼ miles of wagon road, 171½ miles of trail, 96 miles of shed road, and 32 shelter cabins. In the same period the Forest Service expended \$573,118 for roads and trails in the 20,000,000 acres of National forests situated within the Territory. In Mount McKinley National Park 34 miles of main park road were prepared to be put into service in the autumn of 1928.

Aviation. Under a territorial appropriation out of road funds there had been built up to the middle of 1928 no less than 58 landing places for airplanes. Winter mail service by airplane from Nenana to Nome and intermediate points was subsidized by act of the Legislature, and operated through the winter of 1927-28.

Rivers and Harbors. Serving the Yukon and Tanana River route, the steam vessel *Alice*, owned by the Alaska Railroad, was remodeled to increase passenger capacity. The improvement of Wrangell Narrows, carried out by engineers of the United States Army, at a cost of \$449,154, was completed in June, 1928.

EDUCATION. The system of Territorial Schools, directed by a Commissioner of Education at Juneau, and likewise the Agricultural College and School of Mines, were maintained during the biennium of 1927-28 by a Territorial legislative appropriation of \$1,001,350. A supplementary system of schools sustained by money from the Federal Alaska Fund (see *Finance* above) was in operation, but for better administrative results this system was also in charge of the Commissioner of Education for the Territory. About \$50,000 was expended in 1928 on the last-named group of schools. In all there were maintained 16 high schools and 90 elementary schools; teachers numbered 235; pupils, 4828. Seven night schools operated in 1928, with an enrollment of 205 students, chiefly illiterate men. The Agricultural College and School of Mines opened the academic year 1927-28 with 175 enrolled students. Special training of Eskimo boys in reindeer husbandry was undertaken, instructors being trained at the College, as the incidental instruction given previously by the ordinary school teachers in this subject to the young Eskimos had been found not wholly satisfactory.

INDUSTRIES. *Fisheries.* Coming after a disappointing year in 1927, the early part of 1928 brought in the fishing industries unexpectedly

large yields. Of the salmon catch about 93 per cent was canned. The total production of the fisheries in 1927 was \$40,163,300, as against \$54,669,882 for 1926. The salmon catch as usual formed the major part of the product, but was much diminished. In spite of this diminution, the industry of mild-curing salmon made an increase, employing in 1927, 1769 persons and producing 8804 tierces valued at \$1,570,841. A survey of the declining herring industry was in progress in 1928. The halibut catch of 1927 was large, being 34,491,383 pounds, in value \$3,805,088. There were employed in commercial fisheries in 1927, 28,872 persons.

Seals. The estimated number of seals on the Pribilof Islands estimated at 808,870 in 1927 was reported then to be twice the number in 1917. There were taken in that year 24,942 fur seal skins. Of these, 20,315, sold at auction, fetched \$718,801.

Fur and Game. An investigation of the causes of serious losses among the animals of fur farmers was in progress in 1928. Federal legislation made it possible in that year for fur farmers to lease from the Federal Government entire islands, up to an area of 30 square miles; such islands, on account of their natural boundaries, were in particular demand for fur farming. The Pribilof Islands yielded in 1927, in addition to seals, a considerable number of blue and of white fox pelts.

Reindeer. The appointment of a Federal Reindeer Supervisor, under the Department of Education, was authorized, with a view to continuing and improving the Federal supervision of the reindeer industry conducted by the natives. (See also *Education* above).

COAST AND GEODETIC SURVEY. The surveying and charting of the Alaska coast was continued in 1928. A magnetic observatory and seismological station was maintained at Sitka.

ALBANIA, ăl-bă'ni-ă. A geographical district in the Balkans consisting of the former Turkish provinces of Scutari and Yanina and parts of the Turkish vilayets of Monastir and Kassova. The boundaries were fixed as a result of the work of an international commission appointed in 1922, which did not complete its labors, however, until 1925. The probable area of the country is estimated at about 17,347 square miles; the population is estimated at 831,877, of whom 584,675 were Mohammedan, 158,215 Greek Catholic, and 88,987 Roman Catholic. The country is divided into eight provinces named after the chief towns. The latter, with their estimated populations are as follows: Tirana, 12,000; Scutari, 32,000; Korytza, 24,000; Elbasan, 13,000; Argyrocastro, 12,000; Berat, 8500; Valona, 6500; and Durazzo, 5000. The principal race groups are the Ghegs in the north and the Josks in the south. Agriculture is very primitive, and large tracts of land remain uncultivated. The chief products are: Tobacco, wool, olive oil, corn, and cattle. The mineral wealth is reputed to be considerable although almost entirely undeveloped. Drillings for oil in recent years seem to indicate its presence in commercial quantities. There are also valuable forests. A coarse native cloth is manufactured from wool, but for the most part such manufactures as exist in the country pertain to the working up of agricultural products.

Albania has been handicapped by natural conditions—mountains, primitive roads, lack of

railroads, and undeveloped natural resources. As an agricultural country, with practically no native industries, it is entirely dependent on imports of manufactured goods. The latest returns for commerce, those for the calendar year 1926, showed imports of \$4,800,141 and exports of \$2,309,649, leaving an unfavorable trade balance of \$2,490,492. The chief articles of import for 1926 were: Cotton manufactures, woolen goods, sugar, rice, coffee, machinery, kerosene, gasoline, and leather. The chief articles of export for the same year were: Cheese, grains, eggs, skins and hides, lambs and wool. Italy buys most of the exports and supplies most of the imports. The budget for 1926-27 practically balanced at 23,000,000 gold francs, while the estimates for 1927-28 showed a revenue of 29,000,000 gold francs and an expenditure of 26,000,000 gold francs.

Although Albania's independence was proclaimed and recognized as early as 1912, the country remained in a state of virtual anarchy for the next few years. It was declared an independent country again by the general in charge of the Italian forces in the country on June 3, 1917, and a provisional government was set up at Durazzo. Under the constitution adopted in 1925 there is a parliament with 54 members elected every four years and a senate of 18 members, 12 elected and six nominated. The president was elected for seven years by the house and senate sitting as a national assembly. During 1928 the president, Ahmed Zogu, was proclaimed a monarch.

HISTORY. The outstanding event in the history of Albania during the year was undoubtedly the coronation of Ahmed Bey Zogu, President of the Republic, as Scanderbeg III, King of the Albanians, on September 1. The event was preceded by a general election in the summer, which lasted for two months, the general purpose of which was understood by almost everybody to be the selection of a group of legislators who would be friendly to the aspirations of the president and would pave the way for his kingship by amending the constitution to make it possible. This event was forecast for months and was known to have the tacit approval of Mussolini, who, after all, was the real ruler of Albania, particularly when the treaty of Tirana of 1926 was taken into consideration. Curiously enough, the countries who were bitterly opposed to Mussolini's machinations in Albania made no formal protest against the actions of the National Assembly in Albania.

Scanderbeg III, a comparatively young man of 33, had had a very checkered and more or less unscrupulous career. After a good education he succeeded his father to the headship of the Mati tribe, the most powerful in northern Albania. As Albania emerged as a recreated state at the close of the World War, he gradually became the most important man in the country and was known as an anti-Italian. When Fan Noli carried out his successful *coup-de-force* in 1924, Zogu was compelled to flee the country to Jugo-Slavia, where, as a pro-Serb, he plotted his return to his native land. The Nationalist Government of Fan Noli was a complete failure, and within six months, Zogu was back in Albania, where he was received with open arms and hailed as a savior. He immediately convened a very shadowy convention and had

himself elected president for a term of seven years. He himself controlled the legislature, such as it was, by his control over the treasury, and, in his capacity of premier, was virtually dictator of the country. He then turned his face definitely westward toward Italy, and came to be considered a mere tool of Mussolini. Needless to say the Serbs in particular, and the Jugo-Slavians in general hated him because he ruthlessly used them to get back into power and then turned his eyes toward the country considered by Jugo-Slavia as her greatest enemy, Italy. In the last few years, Zogu had bound his country inseparably to Italy, by accepting loans, by making treaties of alliance, and the establishment of a financial system backed by Italian capital. The rule of the new king was shortly recognized by most of the important powers of the world, including the United States.

Scanderbeg's position was anything but secure. In many quarters of his kingdom, discontent was rife and fear was expressed for the strong central government which he planned to establish. The Albanians are peculiar people. They are unaccustomed to render allegiance to any central authority and look to the tribal leaders for their orders and are imbued with such fanatical local prejudices that the country is the home of one huge vendetta. It was not considered to help Scanderbeg's future any that he was a member of the hated Moslem religion, while most of his subjects are Catholics or Greek Orthodox Christians. In a land of vendetta, his many executions, hundreds of which had occurred since his coronation, must have stirred feelings of revenge in the hearts of many of his subjects, which must, sooner or later, result either in his assassination or the driving of his régime from power.

ALBERTA, ál-bûr'tà. A northwestern province of Canada, formerly consisting of a large part of the Northwest Territories; bounded on the east by Saskatchewan, on the west by British Columbia, and on the south by the United States. Area, 255,285 square miles; population (1926), 607,584, as compared with 496,442 in 1916. The rural population in 1926 numbered 374,614, and the urban, 232,970. Chief towns with their populations according to the census of 1926; Calgary, 63,513; Edmonton, 65,163; Lethbridge, 10,893; and Medicine Hat, 9536. The movement of population in 1926 was: Births, 14,455; deaths, 5156; marriages 4498.

The chief occupation of the province is agriculture, but there are valuable deposits of coal, natural gas, and petroleum. Besides the raising of grain, livestock and dairying are the chief industries. The acreage under crop and the actual production of grains in 1927 were as follows: Wheat 6,251,000 acres, 171,277,400 bushels; oats, 2,248,000 acres, 101,160,000 bushels; barley, 400,000 acres, 12,000,000 bushels; rye, 156,500 acres, 3,130,000 bushels; flax, 12,600 acres, 201,600 bushels; peas, 1350 acres, 25,000 bushels; beans, 270 acres, 4100 bushels; mixed grains, 15,400 acres, 614,000 bushels. According to estimates, Alberta has 14 per cent of the coal reserve of the world. The 1926 production was 6,503,705 tons valued at \$20,886,103. In the same year the value of the natural gas output was \$3,019,221. The production of petroleum was 216,050 barrels valued at \$902,504. The total value

of all mineral production in 1927 was \$29,375,040. Coal production in 1928 was 7,250,000 tons, a high record.

The executive power is nominally vested in a lieutenant-governor appointed by the Dominion Government, but it actually rests in an executive council or cabinet. Legislative power is in the assembly, which is elected by direct vote including woman's suffrage. Of the 59 members in the legislature, 43 were United Farmers of Alberta, 7 Liberals, 4 Labor, and 4 Conservatives. Alberta is represented in the Dominion Government at Ottawa by 6 members in the Senate and 16 in the House of Commons. Lieutenant-Governor in 1928, Dr. W. Egbert; Prime Minister, John E. Brownlee.

ALCOHOLISM. See LEAGUE OF NATIONS.

ALFALFA. The yield of alfalfa hay for the United States in 1928 was estimated by the Department of Agriculture at 29,054,000 tons, as compared with 31,823,000 tons in 1927. The decrease in yield was mainly due to a reduction in acreage from 11,401,000 acres in 1927 to 11,040,000 acres in 1928, resulting largely from winterkilling in some sections and from disease attacks in others. The largest reduction in acreage occurred in Nebraska and Kansas, but the percentage reduction was greater in some of the States north of the Ohio River, where winterkilling in some sections had been quite severe. The States leading in yield in 1928 were California, producing 4,246,000 tons, Nebraska 2,633,000 tons, and Kansas 2,250,000 tons, the average yield per acre for these States being approximately 4, 2.28 and 2.7 tons respectively. The other States producing over 1,000,000 tons, mentioned in decreasing order of yield, were Idaho, Colorado, Montana, Minnesota, Utah, Michigan, and South Dakota.

The production of alfalfa seed in 1928, according to estimates by the Department of Agriculture, was 591,500 bushels, while the year before it reached 851,400 bushels and, in 1926, 960,000 bushels. Crop injury, due in some sections to grasshoppers, frost, and other causes, reduced the acreage cut for seed, and the average yield per acre for the 17 States reporting was only 2.51 bushels as compared with 3.59 bushels the year before. The reduction in yield was especially marked in Idaho, Utah, Kansas, and most of the southwestern producing area. Utah, the leading State in yield and which produced 265,000 bushels in 1927, yielded only 124,000 bushels, being followed by Arizona with 99,000 bushels, Nebraska with 75,400 bushels, and Idaho, usually ranking second and producing 180,000 bushels in 1927, with 51,000 bushels. Nebraska, South Dakota, and Montana were the only States recording significant increases in yield over the preceding year. The average farm price on December 1 in the States reporting was \$11.90 per bushel, while on the corresponding date the year before it was \$9.07. The difference in average farm prices was marked, ranging from \$8.75 per bushel in Texas to \$19.00 and \$19.60 in North Dakota and Minnesota respectively.

The imports of alfalfa seed for the fiscal year ended June 30, 1928, amounted to only 782,300 pounds as compared with 5,133,700 pounds for the preceding fiscal period. A service for the

verification of the origin of alfalfa seed was inaugurated by the Department of Agriculture which seems widely favored among dealers. In 1927, 17,000,000 pounds of seed were verified as to origin and it was estimated that in 1928 certificates of origin covering over 40,000,000 pounds of seed would be issued. In some sections of the alfalfa-seed producing area official field inspection and registration and seed certification is practiced.

A variety of alfalfa introduced by the Department of Agriculture and named Ladak after the province in northern India from which it came was reported as comparing very favorably in winter resistance, yielding capacity, and quality with Grimm. Northern Common, and other hardy varieties.

ALGERIA. A colony of France forming politically a part of France itself, situated in northern Africa. It comprises the two great divisions of Northern and Southern Algeria which in turn are divided as follows: Northern Algeria into the departments of Algiers, Oran, and Constantine; Southern Algeria into the territories of Ain Sefra, Ghardaia, Touggourt, and the Oases of Sahara. The total area, including the Algerian desert, is estimated at 1,069,000 square miles: population, including military forces, according to the census of Mar. 7, 1926, 6,064,865, of whom 5,552,640 were in Northern Algeria. The Europeans numbered 872,439. All but a small fraction of the population was in the towns and cities. Chief towns with their populations for 1926: Algiers, 226,218; Oran, 150,301; Constantine, 93,733 (these three being respectively the capitals of the provinces of the same name); Bône, 51,895; Tlemcen, 26,758; Sidi-bel-Abbes, 43,148; Blida, 24,758; Tizi Ouzon, 2944; Philippeville, 20,242; and Sétif, 26,677.

The race groups in the native population are principally Arabs, Berbers, and Kabyles, and the prevailing religion is Mohammedanism. The chief Christian church is the Roman Catholic which maintains an archbishop and two bishops. In 1926 there were 1302 primary and infant schools, public and private, with 110,031 pupils. There were also 17 establishments for secondary education with 9773 students. For higher education there is a university at Algiers which had 1664 students in the fall of 1926, and there are special schools of commerce, hydrography, agriculture, and the fine arts. There are also higher Moslem schools at Algiers, Constantine, and Tlemcen.

PRODUCTION. The country is dependent primarily upon agriculture. By far the most important crops are the cereals, followed by grapes. Climatic conditions are uncertain, there being a large surplus of cereals for export some years and in other years local supplies must be supplemented by imports. The drought of 1926 resulted in poor crops generally and, for the same reason, the yields in 1927, though generally larger, were for the most part below normal. Crops of cereals estimated at 1,693,000 metric tons in 1927, were far short of the average crop of 2,200,000 tons. Wheat production placed at 768,000 tons, was sufficiently large for domestic consumption, and compares favorably with the average of 672,000 tons for the years 1920 to 1926. The barley yield, normally the largest of all cereals because it requires less rainfall, was considered satisfactory at an estimated 766,-

000 tons. As a wine-producing country, Algeria, with an average yield over a five-year period of 9,764,000 hectolitres, ranks after France, Italy, and Spain, and is one of the foremost exporting countries. Efforts to develop cotton growing, extending over a great number of years, have met with slight success. The production of olive oil, estimated at 27,500 metric tons, was more than double that of 1926. The tobacco crop attained the same production figure as did the olive oil. While the extent of Algeria's mineral wealth has not yet been fully estimated, this branch of industry has grown largely in importance. Phosphates and iron ore are the most important products. The output of phosphates reached the high total of 847,000 metric tons in 1927; that of iron ore, at 2,029,000 metric tons, was the largest since the war.

COMMERCE. On a dollar basis, trade in 1927 was the highest in five years. Total imports were valued at 4,836,000,000 francs (\$136,857,000), as against 4,119,000,000 francs (\$130,349,000) in 1926. The value of exports in 1927 was 3,521,000,000 francs (\$136,049,000), as compared with 4,015,000,000 francs (\$127,057,000) during the previous year. The principal imports in 1927 were sugar, petroleum, paper, clothing, and automobiles; the principal exports, sheep, phosphates, eggs, wheat, figs, tobacco, cigarettes, and wines.

FINANCE. Receipts from direct taxation and sundry payments in 1927 totaled 134,115,000 francs, as against 103,020,000 francs in 1926. Notwithstanding the ill effects of poor crops, other net tax returns under the ordinary budget, amounting to 509,926,000 francs, were well above estimates and exceeded the 1926 returns by more than 20 per cent. Extraordinary budget returns, comprising the match tax, were lower at 4,935,000 francs. Receipts under the supplementary budget for post, telegraph, and telephone services increased to 63,735,000 francs. The ordinary budget for 1928 provided for revenues of 720,060,006 francs and expenditures of 719,881,836 francs. The extraordinary budget for the same year balanced at 209,713,120 francs.

COMMUNICATIONS. Transportation facilities is a subject of primary importance, particularly in view of the vastness of the country. As the railways are inadequate, the highways provide the only means of reaching many localities. Accordingly, their upkeep and the creation of new roads form one of the major items of the budget. Expenditures on national highways, which in 1927 extended 3325 miles, and on local and departmental roads and paths, totaling another 12,698 miles, were 46,400,000 francs. There has been an encouraging increase in recent years in the length of the railways, which in 1928 totaled 2716 miles, of which more than half are State owned. Receipts during 1927 amounted to 294,000,000 francs. There has also been a very satisfactory increase in the equipment and use of the telephone.

GOVERNMENT. The central executive authority of the local government is the governor-general who directs all the services with the exception of the non-Mussulman departments of public instruction, justice, worship, and the treasury, which are each under a separate ministry. The governor-general, with the minister of the interior, prepares the budget which is voted by the so-called Financial Delegations and by the Superior Council. The colony sends to the home

parliament one senator and two deputies from each of the three departments. The parliament at Paris has the sole right to legislate for Algeria. Governor-General in 1928, Pierre L. Bordes, appointed in November, 1927.

ALLEGHENY COLLEGE. A coeducational institution of higher learning at Meadville, Pa.; non-sectarian in policy but under the patronage of the Methodist Episcopal Church; founded in 1815. The enrollment for the autumn of 1928 was 614, distributed as follows: seniors, 93; juniors, 132; sophomores, 170; freshmen, 219. The registration in the 1928 summer session was 143. The faculty in the autumn of 1928 numbered 40. The productive funds of the college amounted to \$1,400,000 and the income for the year 1927-28 was \$367,234. The library contained 71,000 volumes. Two new buildings were in course of erection in 1928: Arter Hall, a recitation building, the gift of the late Frank A. Arter of Cleveland, Ohio; and Caffisch Memorial Hall, a freshman dormitory for men, to cost \$210,000, the gift of Mrs. Margaret E. Caffisch, Union City, Pa. President, James A. Beebe, D.D., LL.D.

ALLIANCE FRANÇAISE, FÉDÉRATION DE L'. An association of clubs and groups formed for the purpose of encouraging and furthering the study and cultivation of the French language, literature, art, and history in the United States. It was established in 1902, and in 1928 comprised over 250 local branches, including French Alliances, affiliated societies, and French clubs in universities, colleges, and schools. Eight new groups were added to the Fédération during 1928. Each year the Alliance Française brings from France one or more lecturers who are prepared to speak before all the affiliated societies and clubs wishing to hear them. It also organizes lecture tours for distinguished French travelers, and for French lecturers who live in America, and assists in organizing courses in the French language and literature in co-operation with the leading universities, and encourages its groups to engage in dramatic performances and debates in French. The official lecturers from France during the year 1927-28 were M. André Maurois, well-known writer, author of *Ariel*, or *the Life of Shelley*; *Disraeli*; and many other books which had been translated into English; also Madame Aline Caro-Delvaile, lecturer on art and literature; M. Raymond Lange, general secretary of *L'Intransigeant*; and Dr. Julien J. Champenois. The Assemblée Générale of the Fédération, attended by representatives of the various groups, was held at the Hotel Plaza, New York City, on April 14, 1928. The official organs of the Fédération are *L'Echo de la Fédération* and the *Bulletin Officiel*. Headquarters are at 32 Nassau Street, New York City. Officers for the year 1928 were Frank D. Pavey, president; William Nelson Cromwell, general vice president; Albert Blum, president of the executive committee; James N. B. Hill, treasurer; and Felix Weill, general secretary.

ALSACE-LORRAINE, *al'zas'lór'an'.* The provinces taken from France by Germany after the Franco-Prussian War of 1870-71 and restored to France after the armistice of Nov. 11, 1918; constituting at present the three French departments of Bas-Rhin, Haut-Rhin, and Moselle. Total area, 5605 square miles, total population in 1921, 1,709,749. The area and population are distributed among the three depart-

nents as follows: Bas-Rhin (formerly Lower Alsace), 1848 square miles and 651,686 inhabitants; Haut-Rhin (formerly Upper Alsace), 1354 square miles, and 468,943 inhabitants; Moselle (formerly Lorraine), 2403 square miles and 589,120 inhabitants. Alsace-Lorraine contains the only petroleum fields of commercial importance in France, but supplies only about 10 per cent of the total consumption. Iron ore is mined in large quantities. Potash production was affected favorably by the agreement between the Alsatian and German mines for a division of the world market. In January, 1926, the autonomy of the port of Strassburg was established.

ALSATIAN QUESTION. See FRANCE under *History*.

ALUMINUM. According to the U. S. Bureau of Mines, new aluminum produced in the United States during 1927 was valued at \$39,266,000, or 4 per cent more than the 1926 production, which amounted to \$37,583,000. The value of the secondary aluminum produced was placed at \$21,844,000, as compared with a production valued at \$23,868,000 in 1926. The domestic price of new aluminum ingot, 99 per cent pure, was 27 cents during the first half of 1927, but the Aluminum Company of America lowered its price to 26 cents which held until Oct. 20, 1927, when the price was further cut to 25 cents a pound, and remained at that figure at the end of the year, which, taken into consideration in connection with prices of outside metal for the year, gave an average price in 1927 of \$0.254 a pound.

Imports of aluminum into the United States in 1927, including crude aluminum, plates, sheets, wire, etc., were valued at \$13,316,986, as compared with a valuation of \$16,421,905 or 1926 imports of this class. The 1927 imports of the above class, together with manufactures of aluminum, including aluminum leaf, kitchen utensils, and other manufactures of aluminum, valued at \$884,992, brought the total value of imports up to \$14,201,978 as compared with \$16,779,377 in 1926. Imports of plates, sheets, bars, etc., in 1927 increased 215 per cent in quantity and "other manufactures" of aluminum increased 232 per cent in value, as compared with imports of similar products in 1926. Exports in 1927 of aluminum amounted to \$6,407,421 as compared with \$4,452,303 in 1926. Exports of aluminum ingots, scrap, and alloys in 1927 increased 501 per cent in quantity, and plates, sheets, bars, etc., 56 per cent, as compared with 1926 figures, whereas exports of tubes, moldings, castings, and other shapes decreased 28 per cent. Exports of table, kitchen, and hospital utensils increased 7 per cent in 1927 and exports of "other aluminum manufactures" increased 56 per cent as compared with 1926.

The principal aluminum producing plant in the United States was at Massena, N. Y., where approximately half of the metal made in the United States was recovered; there were also plants at Niagara Falls, N. Y., and at Alcoa, Tenn., and Badin (Whitney), N. C. The Aluminum Company of America completed their control dams on the Yadkin and Little Tennessee rivers in North Carolina during 1927, thus assuring continuous power for their Alcoa and Badin plants, which hitherto had suffered from shortage of power at times of drought. During the year aluminum was in large demand in the reduction of automobiles, especially for pis-

tons and reciprocating parts of automotive engines. Aluminum powder for paint pigment was more extensively used, as also was aluminum foil. Aluminum collapsible tubes for pastes, greases, etc., a new but growing utility, and aluminum shingles and corrugated sheet for roofing and siding, were more widely used during 1927 than previously, and the use of aluminum in the manufacture of motor busses, railroad and street cars, airplanes, and furniture was increased during the year.

See also under **CHEMISTRY, INDUSTRIAL.**

ALVORD, CLARENCE WALWORTH. American historian and educator, died at Diano Marina, Italy, January 27. He was born at Greenfield, Mass., May 21, 1868, and was educated at Williams College, the University of Berlin and the University of Illinois. His first teaching was done at the Milton, Mass., Academy, 1891-93, and from 1897 to 1901 he was an instructor at the preparatory school of the University of Illinois. In the latter year he became an instructor in history at the university, and he advanced in position until he became professor of history in 1913. From 1920 to 1923 he was professor of history at the University of Minnesota. He was a member of many historical societies, and wrote extensively on the history of the Mississippi Valley and the Middle West. Among his books were: *Mississippi Valley in British Politics* (2 vols., 1917), to which was awarded the Loubat prize; *The Illinois Country* (1919).

AMERICA. See **ANTHROPOLOGY.**

AMERICAN ASSOCIATIONS AND SOCIETIES. For various scientific and other organizations whose official titles begin with the word American, see under the important descriptive word of the title.

AMERICAN LEGION. An organization of World War veterans chartered by Congress "to uphold and defend the Constitution of the United States; to maintain law and order; to foster and perpetuate a 100 per cent Americanism; to preserve the memories and incidents of association in the Great War; to inculcate a sense of individual obligation to the community, state, and nation; to combat the autocracy of both the classes and the masses; to make right the master of might; to promote peace and good will on earth; to safeguard and transmit to posterity the principles of justice, freedom, and democracy; to consecrate and sanctify the comradeship of the members by devotion to mutual helpfulness."

The tenth annual convention of the Legion was held in San Antonio, Texas, Oct. 8 to 12, 1928, with a delegate attendance of 1116, representing every State, the District of Columbia, five territorial and five foreign Legion departments. The retiring national commander, Edward E. Spafford, in his annual report to the convention, cited the carrying out of the Legion objectives for the year as fixed by the preceding national convention: The recovery of monetary rewards for the disabled totaling \$2,788,301.15, in twelve months up to June 30; the care of dependent children by advancing improved child welfare legislation; the participation of more than 122,000 boys under 17 years of age in the Junior Baseball programme sponsored to the extent of \$50,000 by the two major baseball leagues; the enactment of national legislation providing \$15,000,000 for new hospital construction, the passage of the bill for the retirement

of disabled emergency army officers and the liberalizing of the Veterans Bureau act; the nation-wide educational campaign in favor of the Universal Draft bill not yet enacted; the marking of towns to guide air pilots; and community service. The national convention reaffirmed the Legion's stand on promoting national defense and world peace; the passage of the Universal Draft act; the promotion of junior baseball and the advancement of child welfare legislation in various states.

Distinguished guests of the convention included Field Marshal Lord Allenby of Great Britain; Gen. John J. Pershing, U. S. A.; William Green, president of the American Federation of Labor; Major Georges Scapini, blind war hero of France and a member of the French Chamber of Deputies; and Dwight F. Davis, Secretary of War. The convention chose Louisville, Ky., as the place for the eleventh convention, to meet in 1929. Following the close of the convention, the retiring national commander, Edward E. Spafford, and the national adjutant, James F. Barton, headed a group of Legionnaires on a tour of Mexico, visiting Mexico City where they were welcomed by President Calles. Many side trips were made to border cities in Mexico by the Legionnaires who carried with them the spirit of good will and the promotion of friendly relations, as was done on the post-convention tour of European countries following the ninth annual convention held in Paris, Sept. 19 to 24, 1927.

The official publication of the national organization is *The American Legion Monthly*, published at 2457 East Washington Street, Indianapolis, Ind., in addition to which there are official publications of departments and posts totaling 215. The membership of the Legion on Sept. 9, 1928 was 751,721. The American Legion Auxiliary, composed of mothers, wives, sisters, and daughters of veterans, had a membership, as of Aug. 31, 1928, of 297,957. The Auxiliary, La Société des 40 Hommes and 8 Chevaux, and La Boutique des Huit Chapeaux et Quarante Femmes, the fun-making and honor organizations of the Legion and Auxiliary respectively, aided the Legion in all its endeavors.

The officers of the Legion elected for the year 1928-29 follow: Paul V. McNutt, Bloomington, Ind., national commander; E. L. White, of Connecticut, Lawrence E. McGann, of Illinois, George Malone, of Nevada, Millard C. Foster, of South Carolina, and Walton D. Hood, of Texas, national vice commanders; Rabbi Herman J. Beck, of Pennsylvania, national chaplain. The following national officers continued in office: James F. Barton, of Iowa, national adjutant; Scott W. Lucas, of Illinois, national judge advocate; Bowman Elder, of Indiana, national treasurer; and Eben Putnam, of Massachusetts, national historian. The permanent headquarters of the Legion are in the War Memorial Building of the \$10,000,000 War Memorial Plaza of Indianapolis, Ind.

AMERICAN REVOLUTION CELEBRATIONS. See CELEBRATIONS.

AMHERST COLLEGE. An institution for the higher education of men, at Amherst, Mass.; founded in 1821. For the 1928 autumn term 739 students were enrolled, including: Fellows, 7; graduate students, 7; seniors, 159; juniors, 167; sophomores, 200; freshmen, 197; and specials, 4. The active faculty, exclusive of emeritus and

administrative officers and those on leave, numbered 65. The productive funds of the College amounted to \$7,250,000, and the income for the year was \$712,000. The library contained 151,000 volumes. During the year the Anson D. Morse Professorship of History was established by a gift of \$160,000 from a donor whose name was not made public; the Charles Morton Merrill Fund (scholarship) was established through a gift of securities, valued at about \$100,000, by Charles E. Merrill, class of 1908; and the Moore Chemistry Laboratory, the gift of Mrs. William Henry Moore, Edward Small Moore, and Paul Moore, was under construction. President, Arthur Stanley Pease, Ph.D.

AMMONIUM SULPHATE. See FERTILIZERS.

AMUNDSEN, ă'mŭn'sen, ROALD. Norwegian explorer who discovered the South Pole, was last heard from June 18, a few hours after he and five others left Trömsö, Norway, in the French Latham seaplane, to search for Umberto Nobile and his *Italia* crew, who were lost in the Arctic. (See POLAR RESEARCH.) The governments of Norway, France, and Italy abandoned hope of recovering either party of explorers soon after a float, found drifting near the Fugloe Islands off the coast of Trömsö on August 31, was identified as that of the Latham plane. Amundsen was born at Borge, Norway, July 16, 1872, and after being two years at a medical college in Christiania (now Oslo), he gave up that profession, and in 1893 tried unsuccessfully to join the crew of the *Fram* on Fridtjof Nansen's arctic expedition. He spent the next few years on whaling and fishing boats, and, having also attended the Christiania public sailors' school, he joined the *Belgica* in 1897 as first mate, and accompanied Captain Adrien de Gerlache on the first expedition to remain throughout the winter in the Antarctic region. Two years after his return to Norway, in 1899, Amundsen raised enough money to buy a small whaling boat, the *Gjøa*, and sailing north, he hunted, and made important observations concerning the East Greenland currents. On June 16, 1903, he was able to start in the *Gjøa* with six men to accomplish what no other ship had ever achieved, the passage from the Atlantic to the Pacific Ocean north of America. This expedition took three years, and making his base at King William Land, Amundsen recorded scientific measurements and observations, many of which had not been computed at the time of his death by the authorities in Norway. He proved that the north magnetic pole is near Boothia Felix, the northernmost point of the American continent, but that it has no immovable position such as Sir John Ross assigned to it in 1831.

Returning to Norway, Amundsen bought Nansen's ship, the *Fram*, and hoping to be the first to reach the North Pole, he commenced the long preparation necessary for such an expedition. When Robert E. Peary, U.S.N., discovered the pole Apr. 7, 1909, Amundsen gave no sign of altering his plans for an arctic trip, but started from Norway August 9, of the following year. When he reached the Madeira Islands he informed his crew that he intended to reverse his course and be the first to reach the South Pole. Capt. Robert Falcon Scott of the British Navy had already started from England with the same purpose, and the rivalry in England and Norway grew tense. Amundsen and his companions were expert on skis, and having made their winter

base at the Bay of Whales, they started on foot with a pack of perfectly trained sledge dogs. Skillful management and clear weather brought them to the South Pole, Dec. 14, 1911, several weeks ahead of Scott. They planted the Norwegian flag on the plateau at the pole, and left messages for the English expedition. After his return from the discovery of the South Pole, Amundsen lectured in Europe, Australia, and North America. During the World War he served as commander in the Norwegian Naval Air Service. At the end of the War, in 1928, he bought the *Maud*, and started from Oslo intending to travel as far as possible by water, and then to drift over the North Pole on the ice current. Completing the northeast passage he landed at Nome, Alaska, with engine trouble, in July, 1920, and after another attempt to reach the pole on the *Maud*, with an airplane on board, in 1922, Amundsen became bankrupt in 1924, and postponing his efforts to reach the Arctic he came to the United States. When he arrived, Lincoln Ellsworth, an American explorer, offered to finance him, and on May 21, 1925, they headed for the North Pole in two seaplanes from Spitsbergen, but were forced to turn back when only six hundred miles out. Amundsen, determining that airplanes were better for the flight, made arrangements to fly with Nobile in the dirigible *Norge*, which the Italian had designed and built. The two explorers started, with Ellsworth and Lieutenant Riiser-Larsen, from Spitsbergen May 11, 1926, backed by the Italian Government, and after a flight of seventy-two hours they landed at Teller, on the northern coast of Alaska, having been the first to cross the polar sea. The impulsiveness of Amundsen's adventurous nature led him to trouble as well as to achievement. He and Nobile parted, disputing whether Norway or Italy deserved the credit for the flight. When it became known that Nobile was lost on his second flight to the Arctic, Amundsen, who had retired to Oslo, volunteered to join one of the relief planes sent in search of him. Amundsen wrote: *The North-West Passage* (1907); *The South Pole* (1910-12); *The North-East Passage* (1918-20); *The Flight Across the Polar Sea* (1926); and *My Life as an Explorer* (1927).

ANÆMIA. The treatment of pernicious or incurable anæmia by liver feeding had been known to the world for about two years only, yet few innovations had been accepted so early and so whole-heartedly. It was estimated in 1928 that more than 2000 patients had thus been treated throughout the world, and in not more than 1 per cent was total failure recorded. The price of liver had increased to such a degree that it was one of the most expensive instead of cheapest meats; and the poor who once found beef liver within their means are said to have suffered dietetically, other cheap meats having increased in price. In looking for a discordant or hostile note, Hayem of Paris, now 90 years old and the dean of blood students, was the only reactionary; for while he could not dispute the good results in the treatment of severe anæmias he insisted that technically the numerous cured cases were not examples of the true pernicious form. If he is right, the inference is near that the original pernicious anemia no longer exists, for the percentage of failures is negligible; unless he implies that the true disease will have only a short-lived respite. Naturally some time must still lapse before we can speak of good end results

and radical cures. See also under **FOOD AND NUTRITION. Nutritional Anæmias.**

ANALYTICAL CHEMISTRY. See **CHEMISTRY.**

ANAPLASMOSIS. See **VETERINARY MEDICINE.**

ANDORRA, ăn-dôr'ra. One of the smallest republics in the world, under the joint suzerainty of the French President and the Spanish Bishop of Urgel; situated in a valley of the Pyrenees. Area, 191 square miles; population, 5231, scattered in six villages. The inhabitants speak Catalan and are Roman Catholics. The government is under a council of 24 members which nominates a First Syndic in whom is vested the executive power.

ANDREWS, ăn'drôoz, GEORGE. American soldier, died at Washington, D. C., September 10. Born at Providence R. I., Aug. 26, 1850, he was graduated from the United States Military Academy in 1876, and was commissioned second lieutenant in the Twenty-fifth Infantry. He rose through the successive grades until Feb. 26, 1898, when he became assistant adjutant general with the rank of major. He served in Cuba and in the Philippines as well as in the United States. His service in the Adjutant-General Department culminated Aug. 5, 1912, with his appointment as the Adjutant General of the Army, a position which he held until his retirement in 1914.

ANEMIA. See **ANÆMIA.**

ANGOLA, an-go'la, or **PORTUGUESE WEST AFRICA.** A colony on the west coast of Africa belonging to Portugal since 1575, with the exception of the years 1641 to 1648 when it was held by the Dutch. Its present boundaries were assigned by conventions of May 12, 1886, Dec. 30, 1886, May 25, 1891, and June 11, 1891, separating it from the French Congo, Southwest Africa (afterward united with the Union of South Africa), Belgian Congo, and British South Africa (now Union of South Africa), respectively. Area, 484,800 square miles; population, according to Portuguese estimates in 1920, 5,000,000, but the native population had been estimated as low as 2,124,361 in 1914. Capital, São Paulo de Loanda; other important towns, Kabinda, Ambriz, Novo Redondo, Benguella, Mossamedes, and Port Alexander.

According to the latest available educational statistics there are 52 government schools, seven municipal schools, and two private schools, with about 2410 pupils altogether. The principal products are coffee, rubber, wax, sugar, vegetable oils, coconuts, ivory, oxen, and fish. Mineral products include malachite, copper, iron, petroleum, and salt, and gold has also been found. In 1926 the imports were valued at 225,569,000 escudos and the exports at 188,459,000 escudos. The chief imports of the province are textiles and the chief exports are coffee, maize, diamonds, and oil-seeds. The bulk of both the export and import trade is with the mother country. Angola has its own budget, the revenues for which are largely derived from taxation and customs duties, although from time to time the home government grants a subsidy. In 1926-27 the estimated revenue and expenditure was 135,218,863 escudos and 193,187,692 escudos, respectively. In 1920, 818 miles of railway were open to traffic. There were also 2420 miles of roads and 7452 miles of telegraph lines. The government is in the hands of a high commissioner vested with large powers, whose seat of government is at

Loanda. The colony, according to the charter of Oct. 15, 1926, is divided into 12 administrative districts, each under a governor.

ANHALT, än'hält. A German free state, formerly a duchy of the German Empire, bounded by the Prussian provinces of Brandenburg and Saxony. Area, 888 square miles; population, according to the census of 1925, 351,045. Capital, Dessau, 71,272 inhabitants in 1925. Other cities with their populations in 1925 are: Bernburg, 34,305; Cöthen, 26,595; Zerbst, 19,470; Rossau, 12,520; and Coswig, 10,103. The majority of the population adheres to the Protestant religion. The estimated revenue and expenditure for the fiscal year 1927-28 balanced at 24,472,000 marks. The public debt on Mar. 31, 1927, was 18,000,000 marks and the value of state property on Mar. 31, 1927, was 350,000,000. The government under the constitution of the free state of Anhalt dates from July 18, 1919, and by the law of Nov. 6, 1922, the administration is carried on by a ministry of state consisting of the prime minister or minister president and either one or two other ministers. As a result of the election held in November, 1924, the following parties were returned to the legislature: Socialists, 15; Middle Class party, 14; Democrats, 4; Communists, 4; and National Socialist, 1.

ANIMAL DISEASES. See VETERINARY MEDICINE.

ANNAM, än-näm'. A protectorate belonging to France, forming a part of French Indo-China (see FRENCH INDO-CHINA) whose present status was established by the treaty of Feb. 23, 1886. Area, about 39,758 square miles; population in 1926, 5,580,794, including 2584 Europeans, exclusive of the military forces. Capital Hué, with a population of 60,611; largest town, Binh-Dinh, with a population of 147,199. The population is Annamite in the towns and along the coast, while Moi tribes inhabit the highlands. The products include rice, cotton, corn, and other cereals, mulberry, the arica nut, cinnamon, tobacco, sugar, betel, manioc, and bamboo. The forest products include coffee, dye, medicinal plants, caoutchou, and cardamoms. Raw silk is also produced. Probably the most important product is rice. Of the minerals, copper, zinc, coal, hematite, iron, and salt are worked to some extent. Exports in 1926 totaled 96,775,317 francs; imports, 67,468,123 francs. The nominal head of the government is the king, but actual power is vested in the French Resident Superior. French troops are in occupation of a part of the citadel in the capital. King in 1928 Bao-Dai, who succeeded to the throne Nov. 6, 1925. During his minority the government is in the hands of a Regency Council. A chamber of representatives of the people was established in 1926.

ANNIVERSARIES. See CELEBRATIONS.

ANTARCTIC EXPLORATIONS. See POLAR RESEARCH.

ANTHRAX. The sensational cases of shaving brush infection from the anthrax bacillus seem to have been prevented by better supervision of manufactures, but anthrax as an occupational disease is still with us as shown by a paper published in *The Lancet* for Sept. 22, 1928, by Dr. A. E. Hodgson of the City Hospital at Liverpool. This author first reminds us that the city and port of Liverpool has the largest trade in wool, hair, and hides in the world and that many tanneries are present in the vicinity. In four and a half years he had had 31 patients

with the so-called cutaneous anthrax, otherwise malignant pustule or malignant carbuncle. Of this number but two patients died. This superior result he obtained entirely through treatment with anthrax serum, for nothing was done locally save apply antiseptic dressings. It is unfortunate that he did not mention blood tests, for the general belief has been that after the bacillus has gained access to the patient's blood the outlook for recovery is bad. He merely stated that the two fatalities were in an advanced stage of the disease on admission. The serum is injected into the veins while those men who have been exposed to infection have received preventive subcutaneous injections, and thus far no workman treated in this manner has contracted the disease.

ANTHROPOLOGY. The year was rather infertile, if measured in terms of publications, expeditions, discoveries, or novel views. Its most significant feature perhaps was the appearance of several synthetic studies in the American field. This would indicate that anthropologists in 1928 were in a position to summarize and compare the cultures of broad areas without glossing a multitude of lacunae. Several of these studies bear on southwestern United States, others on the Southern States and Middle America, while for the first time the cultural antecedents of the Eskimo had been established by broad scale archaeological investigations.

The primary concern of anthropologists appeared to be the unravelling of culture history. More theoretical problems still lie fallow, although on this side F. Boas' *Primitive Art* is a noteworthy contribution. The second volume of W. Schmidt's monumental *Ursprung der Gottesidee* deals with religious beliefs which this author holds archaic, such as those of the Bushmen and Algonkians.

Popular interest had not slackened. Numerous magazine articles appeared on race problems, primitive mores, and the like. One general work has been provided the English reading public, F. Boas' *Anthropology and Modern Life* (New York).

Theoretical Ethnology. The spread of mankind over the world in ancient times carried everywhere the basic arts on which all civilizations rest. But as they shifted from one geographic environment to another, adaptations of the archaic culture were necessary and new forms made their appearance. Dissemination of these new arts by contact as well as migration is known from the earliest times. The course of culture history, in short, has been the repeated development of local specializations, followed by their diffusion which led to a releveling of cultures, on which basis new specializations in turn appeared, and so endlessly. Such is the essential process of *The Building of Cultures* (New York) as outlined by R. B. Dixon, and in which he is at one with the majority of American scholars. In such a view a predominant rôle is given neither to environment nor diffusion. Not content with the task of delineating the world development of cultures, Dixon took on himself the task of demolishing the position of the extreme environmentalists and the arch diffusionists (Wissler, Elliot Smith, Perry, Graebner, and Schmidt).

Inferences of this sort rest on the interpretation of cultural resemblances over the world. Some attention has been given in recent years to refining the technique for handling these data in more objective fashion. A discussion of "Probability and the Diffusion of Culture Traits"

(*Amer. Anth.*, 30, 94), by W. D. Wallis, involves a criticism of the statistical method propounded by Clements, Schenck, and Brown (see *YEAR BOOK* for 1926, p. 41). All similar traits found in two groups cannot be given the same weight in determining relationships, according to Wallis. Clements has successfully met the criticism (*ibid.* 295).

The classic definition of culture propounded by Tylor, the founder of modern anthropology, as "those capabilities and habits acquired by man as a member of society," has been tacitly accepted by all his followers. If it means anything, it means that culture is a set of behavior patterns, and that the anthropologist's chief concern should be with determining how the original nature of man becomes fixed in these forms. Even such an approach as M. Mead's *Coming of Age in Samoa* (New York) is quite oblique. This author set herself the task of determining how far acts of an adolescent girl are determined by her physiological status and how far by the conventions of her society, and to this end contrasts Samoan experiences with modern America. Since Samoan households are fluid in the extreme and expanded, as it were, by all the blood bonds that thread through the village, personality differences can be easily adjusted by a change of residence. "Within the household, age rather than relationship gives disciplinary authority." The child's knowledge of sex is unsophisticated and sex relations are entered upon naturally and casually. Adolescence is for the Samoan girls not a period of stress but "instead an orderly development of a set of slowly maturing interests and activities."

For many years F. Boas has contributed to the subject of *Primitive Art* (Oslo); these observations have now been coordinated and expanded in a general discussion. The whole field of primitive artistic expression is explored, graphic and plastic art, music, literature, and the dance, but the former come in for the major share of analysis. There are certain principles, however, that hold for all forms. "Art arises from two sources, from technical pursuits and from the expression of emotions and thought, as soon as these take fixed form. . . . Artistic enjoyment is, therefore, based essentially upon the reaction of our minds to form." So far as technical control enters, the aesthetic response is not alone to the form achieved but lies as well in the sense of complete control or virtuosity. Play with technical processes has often resulted in forms, which in turn have become the fundamental styles of a people's art. Some of these formal elements are due to symmetry, rhythm, and emphasis of form. But equally important in characterizing a style is the conceptual content or symbolism, i.e., what the form represents to the observer.

The same meaning can be expressed by geometric forms or realistic, depending on how great the symbolic content, or how fixed the association between form and meaning. An art may then develop along either of these lines, geometric-symbolic or realistic-representative. From this point of view, the question as to whether geometric or realistic art was developed earlier, as maintained by some writers, becomes meaningless. Both forms may occur together among a single people, where caste or sex division of industries permits different lines of development; as indeed they do. On the whole, however, in primitive art, it is the stylistic form which contains

geometrical elements that influences most markedly the other forms of graphic art. When we compare the arts of space (graphic and plastic arts) with the arts of time (poetry, music) we find rhythm to be common, "and it seems likely that the rhythm of technique is merely a special expression of the rhythm of time, in so far as the rhythmic movements result in rhythmic forms when applied to technical pursuits." Symmetry is, however, lacking in the arts of time, because an inverted order does not convey the same sense of order, but it does occur in the dance, which combines both space and time. The time arts also rest on symbolic meaning for their ulterior significance.

PREHISTORY. An excellent survey of the prehistory of Siberia and Mongolia has been provided by W. Jochelson incidental to his "Archæological Investigations in Kamchatka" (*Carnegie Inst. Wash.*, No. 388). Palæolithic remains are concentrated in southwestern Siberia and occur in Mongolia. Their geological and cultural position is somewhat uncertain, but the earliest are generally comparable to the European Mousterian. Neolithic sites, derived from these, are scattered throughout Siberia, Mongolia, and Manchuria. The Siberian neolithic may have existed under a more genial climate than the present. Bronze-age culture, with possible Scythian and Assyrian affiliations, is known from the upper Yenisei and Lake Baikal. The iron industry seems to have outstripped it, following directly on the neolithic in further Siberia. Kamchatkan remains are of neolithic type only, attributable to the historic Kamchadal. One type of pottery which was found affiliates with Aino remains as far south as Japan.

A first modern survey of "*Le paléolithique italien*," by R. Vaufrey, has appeared (*Archives de l'Institut de Paléontologie humaine*, mem. 3).

Several hundred prehistoric sites were discovered in the North Arabian Desert by H. Field. P. Van Stein Callenfels investigated neolithic and palæolithic remains in Sumatra.

Progress was made in unraveling the unfortunately scanty neolithic remains in Egypt. G. Caton-Thompson now recognizes two neolithic horizons in the Fayum Desert; the earlier agricultural, the later a poor fishing culture, degenerated because of the shrinkage of the neolithic lake in this area. This culture may have extended into early pre-Dynastic times (*Man*, July, No. 80). The geological conditions of Pleistocene and later times in this area was in process of being worked out (see *Nature*, Apr. 28, 670). It has been suggested that these neolithic cultures are Mauretanian in origin. V. G. Childe upholds their primary local origin. The local forms at first spread westward, to be succeeded by a counter cultural influence (*Ancient Egypt*, 1928, pt. 1).

Several years ago cultures were discovered in the Indus Valley which linked with that of Susa in Mesopotamia. This led to the suggestion of a basic Indo-Sumerian culture. J. Marshall believes, however, that the "Indus" culture is distinctive, although showing intercourse with Susa (*Nature*, Jan. 14, 68). Cross-dating of Indian seals found at Susa fixes the later cities in the Indus at about 3300 B.C. A copper model of a two-wheeled cart found there is thus a thousand years earlier than one figured at Ur, which in turn antedates the use of the wheel in Egypt by another millennium. The drainage system and

other features exhibit a higher degree of development than at Ur.

A rich bronze culture has been discovered by the Oxford-Field Museum expedition at Kish, which S. Langdon dates at a thousand years earlier than the superposed deposit of Sargonic times. The latter rests on an intervening layer which dates before 2900 B.C. (*Nature*, May 26, 1939).

An English expedition left in September for a prehistoric survey of South Kurdistan.

STUDIES ON THE ORIGIN OF CULTIVATED PLANTS (*Bull. Applied Botany and Plant-Breeding*, 26, Leningrad) have an important bearing on the first centres of civilization in neolithic times. N. Vavilov argues for a polyphyletic origin of the principal grain crops in the Old World, although this may not mean an equal number of independent origins of cultivation. Since the wild varieties are almost wholly mountainous, Vavilov argues against their first cultivation in the great river valleys, favoring rather such areas as the Caucasus, Bokhara, Afghanistan, Asia Minor, and Abyssinia.

PHYSICAL ANTHROPOLOGY. The abundance of fossil remains in the Old World linking man to an anthropoid ape ancestry has been accepted as indicating his origin in that quarter. The single find suggesting an early New World existence is a molar tooth from the Tertiary of Western Nebraska which Osborn in 1922 declared a new species, *Hesperopithecus*. New finds led W. K. Gregory to declare "*Hesperopithecus* Apparently Not an Ape nor a Man" (*Science*, 66, 579), the teeth pertaining to an extinct peccary. This negates the best palaeontological evidence for an American origin. Since Osborn rested his case for "Dawn Man" (*Science*, May 20, 1927) on supposed artifacts from the same beds as *Hesperopithecus*, it is important to observe that N. C. Nelson concludes (*Science*, March 23, 1916) that these are pseudo-artifacts, a series selected from innumerable bone fragments because of a fancied or supposed resemblance to human artifacts.

The discovery was announced of a second hominoid tooth in a cave deposit at Chou Kou Tien near Peking, possibly of very early Pleistocene age, and possibly a new genus *Sinanthropus* (*Science*, February 3, 1935).

The publication of A. Hrdlička's "The Neanderthal Phase of Man" (*Jour. Royal Anth. Inst.*, 57, 249) may effect a revolution in our views of the derivation of modern man and of the character of Pleistocene times, should it prevail. In brief, Hrdlička holds that the Penck-Brückner conception of four Pleistocene glaciations is not in accord with the facts; that there were but two major ice movements, Neanderthal man making his appearance toward the close of the warm interval between them. Further, since ancestors of modern man (*Homo sapiens*) are unknown at that time and Neanderthal man appears suddenly to have become extinct, it is preferable to look for *Homo sapiens*' ancestry in the Neanderthal period. For support of this, Hrdlička looks to the wide variations in the Neanderthal race in the direction of modern man.

A new find of three skeletons of the Crô-Magnon race was reported from the Vallée du Roc, Charente, France.

An Expedition under L. S. B. Leakey left August 1 to continue investigations in Kenya, East Africa, where skulls of presumably Pleisto-

cene age and resembling those of European Combe Capelle were found in 1926-27.

A number of analyses of local populations have been made. Measurements of the little-known aborigines of Formosa were made by A. Matsu-mura and E. Miyauchi (*Proc. Imp. Acad. Tokyo*, 3). The central mountain tribes are, in general, shorter, more broad headed, and with wider noses from north to south. Hawaiian natives have been found more like those of Tonga and the Marquesas than Samoans, according to Sullivan and Wissler (*Mem. Bishop Mus.*, 9, No. 4). An Anthropometric Study of Hawaiians of Pure and of Mixed Blood was made by L. C. Dunn. Measurements of a small number of Onas (Tierra del Fuego) were published by R. Lehmann-Nitsche, which, however, doubles the number on record (*Anales del Museo de la Plata*, 2, 57). M. E. B. Renaud classifies *Les Plus Anciens Crânes Indiens du Sud-Ouest Américain*, the dolicocephalic Basket-Makers, with the somewhat hypothetical Lagoa Santa race of South America, and with Verneau inclines to a Papuan connection (*Revue anthropologique*, 38, 43).

A current explanation for racial differences in pigmentation of the skin rests on the assumption that this varies in its absorptive and reflective properties. It is important to observe that Shaxby and Bonnell found no differences between Caucasian and Negro skins (*Man*, April, No. 42). An important method for analyzing *Family Traits as Determined by Heredity and Environment* was demonstrated by F. Boas (*Proc. Nat. Acad. Sci.*, 14, 496).

OLD WORLD ETHNOGRAPHY. Madagascar, that Malay enclave of Africa, has remained ethnographically obscure despite Grandidier's classic account. As the result of his recent survey, R. Linton is now able to discriminate three Culture Areas in Madagascar (*Amer. Anthro.* 30, 363). The east coast area is characterized by local patrilineal units, each comprising a series of villages. Fishing is important and domestic animals are for sacrifice only. Each local group (gens) has a chief by primogeniture; that of the leading gens is tribal king, whose function is judicial. Marriage is exogamous. Each tribe has a sacred river. In the plateau area hilltop villages are fortified. Rice is cultivated in an elaborate terrace system; weaving is highly developed, pottery and metal working less so. The gentile organization of the east coast is here partly superseded by a feudal system in which the king allots estates to his retainers. He is an absolute monarch, controlling all life, owning all land, and taking a ground rent. Marriage is ordinarily endogamous to keep property in the family. The west coast and south is predominantly a cattle area, agriculture is little practiced, and milk the chief food. Metal work, carvings, and decorations are highly developed. Canoes have outriggers; fishing is important. Political groups were larger and more closely knit than in the other areas, although the gens is here also the social unit. The king is absolute and is treated with exaggerated respect. There is no noble class as in the other areas. The family is patrilineal and marriage usually endogamous. A supreme being is clearly personified and has his antithesis in a god of evil. Medicine-men have an important rôle. Common to all the areas are agriculture, ancestor worship, and sacrifice.

The success attending the now general use of distribution studies in unravelling culture history

is exemplified by K. G. Lindblom's "The Spiked Wheel-Trap" (*Riksmus. Ethnog. Avdeln.*, Stockholm, No. 5). The device is common to the Nile and Niger drainages, Central Europe and in central Asia among ruder peoples. This suggests an ancient origin; it was in fact known to the classical world, and may date from late Palæolithic times. Similarly Lindblom finds that "The Use of the Hammock in Africa" (same ser., No. 7) is derived from native America through European intermediacy.

An archaeological and anthropometric expedition to the Sudan by F. R. Wulsin, P. T. L. Putnam, and M. Katz was undertaken for Harvard University. Their survey is from Rejaf on the Nile by way of Lake Chad to Nigeria.

The first number of *Africa*, the journal of the new International Institute of African Languages and Cultures, appeared under the editorship of D. Westermann. It contains much ethnographic material, with some emphasis on its utilization for administration of the natives.

An analysis of *The Formation of the Chinese People* (Cambridge), by Chi Li, is based on local physical types, wall-building activities, and the distribution of family names between 722 B.C. and 1644 A.D. This author insists on the composite character of the Chinese population.

Among the simplest Malayan people, untouched by Hindu and Mohammedan influences, are the natives of Mentawai Island, west of Sumatra. E. M. Loeb sketches "Mentawai Social Organization" (*Amer. Anth.*, 30, 408) as centring in two groups; communities within the village, each with a ceremonial house, and the family group. The manifold rituals of the former are in charge of a priest, of the latter, the husband, who is in a sense a priest. Kinship is of the sib type, although sibs, present in Sumatra, are unknown here. Marriage is matrilineal and effected by purchase. In most instances the couple live together long before the formal marriage takes place; children born prior to this are adopted by the woman's family and readopted by the father after the ceremony.

The culture of barely known *Rossel Island* (Cambridge) is to some extent different from other southern Massim groups (Melanesia), according to W. E. Armstrong. Their language also has underlying non-Melanesian features.

The University of Leningrad reported current linguistic work among several Siberian groups: Ostyak-Samoyed, Koryak, Asiatic Eskimo, Chukchi, Gilyak, Turki, and Tungus.

The Arctic and Sub-Arctic natives of Siberia differ from the corresponding tribes of America in their dependence on reindeer breeding. Researches on this subject by W. Bogoras bring several new features to light. The Yenisei-Ostyak and the Ostyak-Samoyed must now be added to the list of reindeer breeders. Hitherto it had been supposed that the Yeniseians were fishers using only dogs for transportation. Their reindeer are left to roam in the forests during spring and summer, in the manner of the Lapps. Not only do their deer, the largest in Siberia, resemble those of the Karghas and Soyot of the Savan Mountains, but details of breeding are the same.

The Ostyak-Samoyed are culturally affiliated with the Yeniseians, according to I. N. Prokofyev. Both are forest border tribes with similar material culture. The Ostyak-Samoyed language more closely resembles that of the south-

ern Samoyed than the adjacent northern branch (Yurak). The Shortsi, a Turki tribe east of the Obi River, are described as hunters and root gatherers devoid of cattle breeding and agriculture, by N. P. Dyrenkova and L. N. Potapov. These authors hold that this was originally the condition of life among other Siberian Turki tribes.

Cultural resemblances between the natives of northeast Siberia and northern North America have long been recognized. Some Russian students, notably W. Jochelson, account for these so-called Pala-Asiatics by a counter migration from America. Recently Jochelson pointed out that the material culture, mythology, and language of the Kamchadal (Kamchatka) more nearly resemble that of the Indians of the northwest coast of America than any other Asiatic tribe or the intervening Eskimo.

NEW WORLD ETHNOGRAPHY. The period had arrived in North American ethnography when summary studies of the larger areas were beginning to appear. While the continent was far from thoroughly described, this was witness to a maturity unknown a decade previously. A. L. Kroeber's summary for California in 1925 marked the first of these extended surveys. To this he added a brief delineation of the southwestern area, which was scrutinized in more detail by L. Spier, while J. R. Swanton brought to a head his researches on the southeastern area.

The Native Culture of the Southwest (*Univ. Calif. Publ. Amer. Arch. Ethn.*, 23, No. 9) can no longer be conceived as having had only a single early focus in northern Pueblo culture, but the existence and importance of another early development in southern Arizona and Sonora must be recognized. A generic connection of southern Californian culture with Mexico, but not through the intermediacy of the Pueblos, would then be intelligible as derived from a Gila-Sonora source. Central California on the other hand may have been directly affected by Pueblo culture proper. It is doubtful that many Americanists will follow Kroeber in his further and tenuous view that Southwestern and Mexican cultures have affected a far wider span of North American tribes.

Ethnographic studies began in the Southwest in the 'eighties, but these have remained largely uncoordinated. There was, in fact, no well rounded sketch of a single tribe, nor any extended comparative work, prior to the appearance of L. Spier's "Havasupai Ethnography" (*Anth. Papers, Amer. Mus. Nat. Hist.*, 29, pt. 3). The Havasupai are a non-typical tribe, whose culture resembles more that of the lowly Great Basin peoples than the adjacent richly-endowed Hopi and Navajo. Investigation of cultural interrelations makes this study a profitable starting point for further researches.

Two brief contributions to the social and ceremonial structure of the Pueblos are (1) a summary of the hitherto unknown society of Acoma, by L. White, in which is revealed an organization surprisingly like Zuni to the West, and (2) the consequences of a Laguna migration to Isleta, in which E. C. Parsons points out the retention of the immigrant language and arts, but the integration of social and ceremonial organizations (*Amer. Anth.*, 30, 559, 602). The latter investigator is also convinced that there are many Spanish elements in the Kachina (god impersonation) cult of the Pueblos. Many masked

performances are thought to be taken over bodily from those used in folk-rituals of the early Spanish church. While this accounts for much of their recent development, the fundamentals of the cult are purely native.

An analysis of the "Social Life of the Navajo Indians," by G. E. Reichard (*Columbia Univ. Contr. Anthro.*, 7), reveals numerous localized and exogamous clans. Their localization appears due, in part, to matrilocal residence, coupled with the tendency of particular clans to link by intermarriage. Unlike Pueblo clans these are politically and ceremonially functionless. They are grouped in larger nameless sets, practically exogamous and not localized. Each set comprises clans bearing local names together with others named for Pueblos, etc. Polygyny takes several forms: sororate, or with mother and daughter, and with a woman and her sister's daughter. Marriage is preferably with a member of one's father's clan. Personal property, both tangible and incorporeal, is individually owned regardless of sex or age, and is matrilineally inherited: grazing land is communal. The last tribal assembly was held a century ago. So far as known, it followed the lead of a council of twelve war, and twelve peace, chiefs, any of whom might have been women.

Little has appeared on Southwestern archaeology, although a number of expeditions were in the field. The limits of early Pueblo culture were pushed westward to central Nevada by M. R. Harrington (*Indian Notes*, 234). A. B. Reagan reported on the little-known western Navajo country (Arizona), which contains remains from the early slabhouse period to the glazed ware era. N. Judd suggests that Pueblo Bonito (N. M.) held peoples of two distinct cultures. "Pottery Making in the Southwest" (*Univ. Calif. Publ. Amer. Arch. Ethn.*, 23, No. 8) involves two different techniques, which E. W. Gifford finds have different distributions.

Owing to the disintegration of the aboriginal culture of the Southeast in the colonial period, our sole sources have been recondite historical accounts. Great credit is due J. R. Swanton for marshalling order in this chaotic assemblage of data (*42nd. Ann. Rep. Bureau Amer. Ethnol.*). True Southeastern culture flourished from the Potomac to the Gulf and westward to the lower Mississippi, but was by no means homogeneous. Swanton recognizes subsidiary areas of specialization, but without sharp cleavage. In fact, resemblances between three areas (the Virginian region, Florida, and the lower Mississippi) suggest that the tribes in the heart of the Southeast (the Creek) have disrupted an earlier, more homogeneous culture. This is consonant with Creek legends of migration into their historic habitat. Swanton has presented as prefatory to this discussion his final synthesis of the data on the social organization and religious practices of the Creeks. As our only lengthy description of a Southeastern group, this will take its deserved place among the classics of ethnographic literature.

The caste system of the Natchez of Mississippi is a unique social form unmatched in America save on the northwest coast. J. P. B. de Josselin de Jong, following Kriekeberg's suggestion, derives the castes from ancient exogamous phratries. "The subdivisions of the nobility must be genetically related to the ancient graded clans and the peculiar rules of descent with regard to

class membership may be explained as a compromise between the strict observance of class exogamy and the growing tendency to endogamy which characterizes the Natchez organization as a nascent caste system."

Ethnographic studies from various areas have appeared: further contributions to the ethnology of the Fox Indians (Illinois), by T. Michelson (*Bull. Bur. Amer. Ethnol.*, 87), and wholly new "Notes on the Akwa'ala Indian of Lower California," by E. W. Gifford (*Univ. Calif. Publ. Amer. Arch. Ethn.*, 23, No. 7). Gifford also observes that the cultural position of the coast Yuki is that of a simple, ancient form of California culture, overlaid by traits from the southern outpost of the Northwest culture area in northwestern California (*Amer. Anth.* 30, 112). A southward drift of Northwest coast tribes is indicated by legends according to C. M. Barbeau. He also believes that the great development of the art of the totem poles is post-Russian, i.e. since 1850, although the basic art is prehistoric. F. Boas also holds the exuberant development to be recent, but allots some centuries to it (*Primitive Art*, Oslo). Geometric, non-realistic forms seem to have been the earlier and still persist in the South, which suggests that realism has spread from the North.

Progress was made toward establishing the origin of Eskimo culture. Boas and Steensby long ago inferred an inland origin in Sub-Arctic America, which Rasmussen's discovery of caribou-hunting Eskimo west of Hudson's Bay several years ago did much to reinforce. Now K. Birket-Smith has established the existence of elements of this culture throughout Eskimo territory and even beyond in North America and northern Eurasia. He concludes that "the oldest form of Eskimo culture seems to be closely related to a very old, circumpolar culture originally spread over vast regions in Arctic North America and Eurasia. The snowshoe-hunting culture of sub-Arctic America and the reindeer nomadism of Eurasia also spring from the same source, and it does not seem unlikely that it is related to palaeolithic culture." Archaeological evidence has now been found proving the existence of this early (Thule) culture from Alaska to Baffinland. T. Mathiassen, e.g., finds it in K. Rasmussen's collection from Point Barrow and Point Hope, Alaska; J. A. Mason also reports it from Point Barrow. According to A. Hrdlička, the skeletons found by Mason are identical with the present Eskimo of Greenland and Labrador, and differ from the present Alaskan Eskimo. H. B. Collins made an unusual find of bodies preserved by freezing on St. Lawrence Island.

The tendency toward a reduction of the number of linguistic stocks in North America continued. Powell fixed the number north of Mexico at 57. E. Sapir suggests provisionally six fundamental groups: Eskimo-Aleut, Algonquin-Wakashan, Nadene, Penutian, Hokan-Siouan, Aztec-Tanoan. F. Boas objects to such drastic reduction on the ground that the resemblances of these languages may have been due to diffusion rather than genetic connection. At least at one point Sapir seems mistaken. In 1913 he suggested that Wiyot of California was Algonquian. On the basis of G. Reichard's Wiyot grammar, C. C. Uhlenbeck shows that Wiyot is not clearly Algonquian, although there are suggestions of remote genetic connection and more recent lexical influence (*Med. Konink. Akad. Wetenschappen*,

Afdel. Letterk. 63, A, 9, 233; *Int. Archiv. f. Ethnol.*, 28, 153).

An estimate of "The Aboriginal Population of America North of Mexico" (*Smithson. Misc. Coll.* 80, No. 7), by the late J. Mooney, fixes their total at 1,153,000 prior to the period of decimation, their number of recent years being 406,000. Concentration was greatest in California and the plains. (Compare Sapper's estimate, *YEAR BOOK* for 1926, p. 46).

A brief description of the "Ruinas de Tizatlan, Tlaxcala," central Mexico, was issued by A. García Vega and E. Noguera (*Publ. Sect. Educación Pública*, Mexico City, 15, 11).

The relation of the several centres of higher civilization in middle America is conceived by A. L. Kroeber as that of specialized developments from a common cultural basis. These centres reduce on analysis to two, Peru and Mexico-Guatemala. The earliest Peruvian cultures (Nazca and Chimu) bear resemblances to Maya (Yucatan), to be sure, but the subsequent history of the two areas shows little interconnection. M. H. Saville sees Mayan and Chorotegan influences extending down the Pacific coast of Colombia and Ecuador, in fact northwestern South America bears closer resemblance to Central America than to the Peruvian complex to the south.

All of the early or at least simple cultures of Mexico and Central America cannot be grouped in Spinden's "Archaic" culture according to G. C. Vaillant. This investigator distinguishes a number of such lying between Vera Cruz and Costa Rica, representing various phases of development prior to the rise of the higher civilizations.

The most ancient centre of Mayan civilization on the basis of dated monuments is Uaxactun, northeast Peten, Guatemala. S. G. Morley believes that a newly discovered pyramid of "early, almost pre-Mayan style" may be the prototype from which Mayan architecture developed. O. Ricketson points out that the site was occupied long before even this early pyramid was built and that the pottery from this early level is not in the Mayan tradition. J. E. Thompson discovered three hitherto unrecorded Mayan cities in the Cayo district, British Honduras, which were at their height about the ninth century A.D. A surprising find of ancient Mayan textiles in this humid region was reported by F. Blom. Survival of the ancient ceremonial year of 260 days was found among the Quiché by S. K. Lothrop, and of Mayan rituals among the Jacaltenango (Guatemala) by O. La Farge. Even the writing system has been preserved among the Cuna of Panama (F. Nordenskiöld, *Comp. Ethn. Studies*, Göteborg, 7, 1).

An ingenious geological explanation for the gradual northward movement of the Maya during the height of their civilization is offered by L. G. Huntley (*Science*, September 21, 264). Yucatan and Guatemala form a porous limestone region, without surface drainage, but containing water in lakes and pools. Progressive tilting of the land from the south drained the more southerly pools, hence forcing a northward movement of the population.

A new classification of South American culture areas is offered by W. M. McGovern. In place of the historically conceptualized culture strata of Graebner and Schmidt, and the empirically derived areas of Wissler and Kroeber, McGovern's scheme implies a combination of both. He recognizes five major types distributed in

nineteen areas: 1. Areas of Primitive Culture (Fuegian, Patagonian, Pampa, Chaco, Uruguay). 2. Transitional Area (Brazilian Highlands, isolated Forest tribes). 3. Areas of Intermediate Culture (southwest and northwest Amazon, Sub-Andean, East Brazilian, Orinoco-Guiana). 4. Transitional Areas (Antillean, Colombian). 5. Areas of high culture (west coastal, Ecuadorian, Peruvian, Calchaquian, Araukanian).

The rude culture and great isolation of The Indians of Tierra del Fuego (*Contr. Mus. Amer. Ind.*, 10) have long stimulated curiosity. Detailed accounts are, however, of recent date. Kopper's and Gusinde's descriptions of their society and religion are now supplemented on the material side by S. K. Lothrop. This author, in line with prevailing ethnological thought, looks on Fuegian culture as representative of that of the earliest Indians of both Americas. A study of the material culture of the Tupi-Guarani of Brazil has been published by A. Métraux (Göteborg): others on Brazilian linguistics and osteology appeared in the *Revista do Museu Paulista* (Brazil), vol. 16, and R. Lehmann-Nitsche's study of the Temple of the Sun in Cuzco (Peru) in *Revista del Museo de La Plata* (Argentina), vol. 31.

Stratification of cultures was reported from Samaná, northeast Santo Domingo, by H. W. Krieger. A later culture is like that of the Ciguayan seen by Columbus; an earlier people possessed a more meager culture.

The antiquity of man in America is of perennial interest. There is inferential evidence that the ancestral Indians migrated across Behring Strait from Asia, possibly in late Pleistocene or early post-Pleistocene times, and probably with a simple culture corresponding to late paleolithic or early neolithic cultures of Europe and Asia. Heretofore no indubitable case of man's presence on this continent in early times has come to light. Finds of stone blades, associated with fossil types of bison, at Folsom, New Mexico, go far to meet the demands of skeptics. A dozen blades preclude the possibility of accident and their distinctness from historic Indian artifacts adds warrant to their antiquity. B. Brown described the site as a loess deposit of late Pleistocene date, but A. Penck thinks it post-Pleistocene, although ancient. One of the several recently posited cases, that of Frederick, Okla., was discussed by Hay, Cook, and Spier (*Science*, Feb. 10, 160; Apr. 6, 371; Apr. 27, 442; Aug. 24, 184). Hey holds that the artifacts are as old as the associated fossil animals, i.e. early Pleistocene (First Interglacial). Spier expresses doubt, since the artifacts may be of recent inclusion in the gravels, and their reputed antiquity over any known homoid remains in the world stands in contrast to their refined character.

Active search for traces of the original migrant groups across Behring Straits have been made by W. Jochelson in the Aleutian Islands, H. B. Collins on St. Lawrence and Nunivak islands, and A. Hrdlička on the Alaskan coast: all with negative results. The last holds that movements have been continuous since early times; that they were extensions rather than migrations and wholly by water in fairly recent geological times.

A useful "Bibliography of American Folklore," 1915-28, was prepared by A. Lesser (*Jour. Amer. Folklore*, 41, 1).

NEWS, EXPEDITIONS, PERSONALIA. Activities were not so great as in former years. The Göteborg Museum (Sweden) acquired South Amer-

ican collections made by C. Nimuendajú on the Rio Negro and A. Posnansky in the Andes. The ethnographic department of the Naturhistoriska Riksmuseet (Stockholm) continued C. C. Luck's investigations at Lumbwa, Kenya (East Africa), and received collections from British New Guinea and the Chocó (Colombia). The Rijks Ethnographisch Museum (Leiden) secured Siberian and Philippine material by exchange. C. C. Krieger had taken charge of the Far Eastern collections. The Koninklijke Vereeniging Koloniaal Instituut (Amsterdam) reported principal activities in the preparation of earlier expeditions to the Netherlands-Indies: Le Roux on the Rouffaer River and Nassau range in New Guinea, A. Kruyt on the Toradja (Celebes), E. Rodenwaldt on the mestizos of Kisar, and P. von S. Callenfels on Sumatran archaeology. Mr. and Mrs. Ph. C. Vissar-Hoof have reported on the region of middle Asia between Karakorum and Hindu-Kush. Similarly A. Maass (Berlin) has prepared further data on central Sumatra. The Museum für Völkerkunde in Leipzig was still in process of installation in new quarters. Collections were added from China, India, the Amazon, East Africa, and from peasant groups of Europe. Jointly with the Völkermuseen in Hamburg and Dresden, C. Nimuendajú was sent to collect on the lower Tokantins River (South America).

The Forschungsinstitut für Völkerkunde in Leipzig maintained Dr. von Eickstedt in Further India, P. Germann among the interior peoples of Liberia, and J. H. Wilhelm in Angola, north Kalahari, and on the sources of the Zambesi. Seven halls were opened in the new Museum für Völkerkunde in Vienna, containing Far Eastern and Siberian material. The activities of the Anthropologisches Institut der Universität Wien in physical anthropology included J. Wastl's investigation of Tatars, and E. Bondi on skeletal material from New Guinea. V. Lebzelter (Vienna) returned from an expedition to the Bushmen (South Africa) undertaken under the patronage of the Pope through the intermediacy of W. Schmidt (Rome). Of the same *Anthropos* group in Vienna, P. Schumacher visited the Pygmies of Ruanda (East Africa) and P. M. Gusinde the Pueblos (southwest United States). *Anthropos* also published P. Leser's *Entstehung und Verbreitung des Pfuges*, P. Boesch's, *Les Banyamwezi*, and P. Royen's *Die Nominalklassifikation in den Sprachen der Erde*. For the Museo Nazionale di Antropologia e Etnologia (Florence), Prof. Puccioni was in Cirenaica (North Africa) and L. Cipriani in South Africa. Collections of ethnographic and skeletal material have been obtained in Somali (northeast Africa).

At the University of Cambridge (England) E. Minns succeeded the late Sir W. Ridgeway in the Disney Chair of Archaeology. R. U. Sayce, formerly of the University of Pietermaritzburg, was appointed to lecture on physical anthropology and material culture. Activity was curtailed for lack of funds, but coöperation was possible with L. S. B. Leaky in Kenya (East Africa) and W. E. Armstrong of Rossel Island (Melanesia). At the Oxford University Museum, coöperative work by L. H. Dudley-Buxton, D. Garrod, and others has appeared on the Neandertal skull found at Gibraltar in 1927. The Royal Anthropological Institute (London) sent J. H. P. Driberg to the Galla (northeast Africa). For the London School of Economics, R. W. Firth has gone to Tikopia in the Solomon Islands.

Researches in Australia were carried on by the Australian National Research Council, under the direction of A. R. Radcliffe-Brown (University of Sydney). W. L. Warner continued work with the natives of Arnheim Land (north Australia) and U. McConnell and D. F. Thompson with those of Cape York Peninsula (north Queensland). A. P. Elkin visited the Kimberley district, Western Australia. Prof. Shellshear (Hong Kong) made a comparative study of the brains of Australian aborigines, Chinese, and Europeans. A conference on the comparative study of basal metabolism was held at Sydney in May. Investigations of blood grouping in Australian natives is now being extended to the Maori by G. Phillips. Wide interest in the field is attested by the formation of anthropological societies in South Australia and New South Wales.

The National Museum of Canada (Ottawa) had H. I. Smith collecting in British Columbia and among the Blackfeet. C. B. Osgood visited the Hare Indians on the Mackenzie River for ethnological purposes, and W. J. Wintemberg, Labrador, New Brunswick, and southwestern Quebec for archaeology. J. C. B. Grant made an anthropometric study, with serum tests, of the Chippewaiian (Lake Athabaska). The Provincial Museum (Victoria) added W. A. Newcombe to its staff and obtained a Tlingit-Aleutian collection.

The Field Museum (Chicago) conducted four expeditions: archaeological work in British Honduras by J. E. Thompson, H. Field in the north Arabian Desert, and jointly with Oxford University to Kish (Mesopotamia). W. D. Strong visited Eskimo and Naskapi of Labrador. Six new halls of east Asiatic, Oceanic, and African collections were opened. For the National Museum (Washington), H. B. Collins investigated the archaeology of western Alaska, N. M. Judd that of Kentucky, and H. W. Krieger in Samaná, Santo Domingo.

The Bureau of American Ethnology (Washington) had J. P. Harrington continue research of the Chumash (California), J. N. B. Hewitt that of the Iroquois, F. La Flesche of the Osage, T. Michelson of Algonquian groups, J. R. Swanton of the Choctaw, and F. Densmore, the music of Menomini, Nitinat, and Winnebago. J. W. Fewkes was succeeded by M. W. Stirling as chief of the bureau. The Museum of the American Indian (New York) conducted several ethnological expeditions, viz., F. G. Speck to the Naskapi, F. Johnson to the Algonquian (Ontario). G. T. Emmons to southeast Alaska, W. Wildschut in Montana and Wyoming, E. H. Davis in Death Valley (Calif.), S. K. Lothrop in Guatemala, while M. R. Harrington investigated the archaeology of western Texas. General expeditions by H. S. Dickey went to the upper Orinoco River (Venezuela) and by G. Mason to Mexico and British Honduras.

The American Museum (New York) supported work at the Folsom site (New Mexico), G. C. Vaillant in Mexico, M. C. Kahn among the Bush Negroes of Dutch Guiana; E. M. Weyer excavated in the Alaskan peninsula, and A. Pond in the Gobi (Mongolia). At the Peabody Museum (Cambridge), E. Reynolds succeeded C. C. Willoughby as director. Archaeological work in southwestern United States was undertaken by S. J. Guernsey, N. Morss, and C. B. Cosgrove, G. Schwab and F. R. Wulsin visited Liberia and the north Congo areas, respectively.

The University of Pennsylvania conducted inquiries into Delaware Indian linguistics and ethnology, and Catawba linguistics through F. Speck. V. J. Fewkes worked on Pennsylvania archaeology. Similarly, local field work was undertaken by the University of Chicago, where E. Sapir also studied the Gwebo language (Liberia). C. E. Guthe of the University of Michigan made an archaeological survey of central United States. Both these institutions inaugurated instruction in anthropology under J. H. Steward and R. Linton respectively. For the University of Washington, M. Jacobs investigated the languages and ethnology of Kalapuya, Molalla, and Yonkalla in Oregon; T. Adamson, the Nootsak of Washington.

The Bishop Museum (Honolulu) has been continuing ethnographic studies in Polynesia: on Upolu and Savaii under P. H. Buck, on Kauai by W. C. Bennett, on west Maui by W. H. Walker, and on Molokai by B. Cartwright. F. Wood-Jones worked on the inheritance of mixed racial forms and J. H. Stimson on Polynesian dialects. Large collections were received from Guam, Samoa, and Tahiti.

The Dirección de Arqueología of Mexico was largely occupied with mapping and preserving the antiquities of that country. In addition, excavations were undertaken at the pyramid of Tenayuca and, in coöperation with the Carnegie Institute of Washington, at Chichen-Itzá, Yucatan.

The Huxley Medal of the Royal Anthropological Institute was awarded Baron Erland Nordenskiöld of Göteborg, Sweden. Dr. Oyartzum, curator of anthropology, Museum of Santiago, Chile, was awarded the gold medal of the University of Würzburg. Dr. R. R. Marett was elected Rector of Exeter College, Oxford. Dr. A. L. Kroeber, University of California, was elected to the U. S. National Academy of Sciences, and Dr. C. Cole, University of Chicago, was given an honorary doctorate of Science by Northwestern University.

The Twenty-third International Congress of Americanists was held in New York in September. The British Folk-Lore Society held an international congress in London in the same month, in celebration of the fiftieth anniversary of its foundation.

NECROLOGY. One of the leading Russian ethnologists, Leo J. Sternberg (b. 1851), died on Aug. 14. Like others among Siberian anthropologists, he was exiled for political activities to Sakhalin Island, where from 1889-99 he studied with Gilyak, Ainu, and Orok. Later he investigated the Gilyak and Tungus of the Amur River. He became head curator of the anthropological museum of the Russian Academy of Sciences and lecturer at the Geographic Institute and University of Leningrad. Eduard Hahn, professor at the University of Berlin, who died Feb. 24, aged 72, made important contributions to the study of early agriculture and animal husbandry. Holland lost G. P. Rouffaer (born 1860), a well-known student of the history of civilization in the East Indies. Pliny E. Goddard, curator of ethnology, American Museum of Natural History, died July 12, aged 58. He was widely known for his comparative studies of Athabaskan Indian languages. The same institution lost Charles W. Mead, honorable curator of Peruvian archaeology, on February 3, aged 82. W. C. Mills, curator of the department of archaeology, Ohio State Museum,

died January 17, aged 68. Mr. Mills was largely instrumental in building Ohio's archaeological survey into the most complete in the country. H. H. Wilder, professor of zoölogy, Smith College, whose interests also lay with prehistoric man, died February 27, aged 64.

ANTIGUA. See **LEEWARD ISLANDS.**

ANTIOCH COLLEGE. A non-sectarian co-educational institution at Yellow Springs, Ohio; founded by Horace Mann in 1853. The number of students enrolled for the autumn term of 1928 was 649, of whom 197 were women and 452 men. The faculty had 69 members. The productive funds of the institution amounted to \$243,831, and the income for the year was \$397,466. The library contained approximately 29,000 volumes. Antioch College is conducted on the belief that academic training alone does not fit the student for life, and is so organized that the student divides his time between school and practical work in the economic community. President, Arthur E. Morgan, D.Sc.

ANTI-SALOON LEAGUE OF AMERICA.

A federation of churches and temperance organizations in the United States, united against the beverage liquor traffic. It was established in 1895 by a coalition of the Anti-Saloon League of four States and the District of Columbia, and was the outgrowth of the Anti-Saloon League movement started at Oberlin, Ohio, in 1893 by Dr. Howard Hyde Russell. At the end of 1928 it embraced 49 State or Territorial Leagues and had affiliations with 40 other national temperance organizations, as well as with the World League Against Alcoholism (q.v.).

During 1928 the activities of the League were carried on by over 1500 representatives. The legislative work of the League included support of the Jones-Stalker bill to provide increased maximum penalties for the five offenses defined by the Eighteenth Amendment to the Constitution, namely: The manufacture, sale, transportation, importation, and exportation, of intoxicating liquors for beverage purposes. Hearings were held before the Judiciary Committees of each house, the bill was reported favorably at the first session of the Seventieth Congress, and was pending on the calendar of each house when the second session convened in December. The State Department announced that ratification of additional treaties for the suppression of liquor smuggling had been secured with Greece and Japan. These treaties were practically identical in terms with similar treaties previously consummated with other maritime nations. The league was much encouraged by the results of the presidential election, inasmuch as the Hon. Herbert Hoover, who opposed the repeal of the Eighteenth Amendment and declared himself for the efficient enforcement of the laws thereunder, and wished to see the policy succeed, won the election from Gov. Alfred E. Smith, of New York, who made modification of the prohibition law, and the amendment of the Eighteenth Amendment, to provide for the manufacture and sale by the State of alcoholic beverages, prominent issues of his campaign.

The League during the year issued statistics in which the statement was made that the consumption of intoxicants had dropped to a small fraction of its former total. *The American Issue*, published at Westerville, Ohio, is the official organ of the League, both a national edition and many State editions being published. The monthly

circulation was about one million copies. The national headquarters are at Washington, D. C. The officers for the year were: President, Bishop Thomas Nicholson, Detroit, Mich.; secretary, S. E. Nicholson, 370 Seventh Ave., New York City; honorary treasurer, Foster Copeland, Columbus, Ohio; comptroller and acting treasurer, H. B. Sowers, Westerville, Ohio; general superintendent, F. Scott McBride, Washington, D. C.; general manager of publishing interests and of the Department of Education, Ernest H. Cherrington, Washington, D. C.; attorney, Edward B. Dunford, Washington, D. C.

APPENDICITIS. A. Fonio, a well-known surgeon of Berne, Switzerland, published a very exhaustive statistical article in the *Schweizerische medizinische Wochenschrift* for June 16, 1928, in which he seeks to show that appendicitis is very largely propagated from person to person, the intermediary being doubtless some one with a latent, mild or apparently recovered disease. He quotes no less than 17 examples of family epidemics in which anywhere up to 9 or more cases have come from the same household within a certain number of years. Hospital statistics often show that when large numbers of cases become cumulative they tend to come from certain localities to the exclusion of others. Direct transmission from one patient with an acute attack to another with the same outcome is not often suggested, but in practically half of all cases seen by the author there might well have been transmission by a "carrier" in the family suffering from a quiescent form of the disease. The practical importance of this paper is considerable; for when there is a tendency for cases to recur in the same family all the apparently sound members should be examined, their histories taken and their subsequent movements supervised. If there is any suspicion or evidence of a latent appendicitis, they should be subjected to appendectomy. In this way sources of contagion might be cut off and the incidence of the disease in small communities reduced.

ARABIA. A peninsula in southwestern Asia to the south of Syria, Mesopotamia or Irak and the Persian Gulf. The area is estimated at from 1,000,000 to 1,200,000 square miles, the higher figure including the Syrian Desert and the Sinaitic Peninsula. Estimates of the population range from 4,000,000 to 7,500,000. The divisions of the country in late years have been defined as follows:

(1) **HEJAZ.** Hejaz or the Kingdom of the Hejaz was an outgrowth of the World War and after a very precarious existence was compelled to submit to the domination of the Sultan of Nejd at the very end of 1925. During its rather brief career as an independent state its frontiers were always in a state of flux, never being definitely defined except on the west. The estimated area of the country is about 150,000 square miles and its population variously estimated at from 800,000 to 900,000. The population is largely nomadic, although in recent years some villages have been settled where it has been possible to cultivate the soil successfully. The principal cities are Mecca, with a population of

from 50,000 to 60,000 (this is the holy city of Islam, and attracts about 100,000 pilgrims annually; these pilgrims represent the chief source of income of the government); Medina, also a holy city and the seat of Mohammed's tomb, with a population of 15,000; and Jedda, the seaport for Mecca, with about 20,000 inhabitants.

Agriculture in the Hedjaz is not generally practicable, on account of the excessive heat, but in the oases there are large crops, the chief one of which is dates, and in the plateau region wheat, corn, barley, millet, lentils, coffee, and tobacco are raised. There are raised here the famous horses, many of which are sold abroad. The chief exports are hides, wool, and gum; the chief imports, foodstuffs and building materials. The King in 1928 was Ibn Saud, with the title of King of Hedjaz and Sultan of Nejd and its dependencies.

(2) **SULTANATE OF NEJD.** This state is considered the most important unit in the Arabian peninsula and occupies the highland of central Arabia between the Persian Gulf on the east and the Hedjaz on the west. It is ruled by the Saud dynasty, which represents the old Wahabite empire, founded in 1745. In 1928 the population was estimated at 3,000,000. The chief products of Nejd are dates, wheat, barley, fruits, hides, wool, horses, camels, donkeys, and sheep, while the chief imports are piece goods, tea, coffee, sugar, and rice. Reigning Sultan in 1928, Abdel-Aziz ibn Saud.

(3) **JEBEL SHAMMAR.** An emirate north of Nejd and since 1921 an integral part of the Sultanate of Nejd, by which it was captured and annexed. Population, estimated at 250,000. Capital, Hail.

(4) **ASIR.** The principality of Asir lies on the western coast between the Hedjaz and Yemen. Estimated population, 1,000,000; capital, Sabiyah. Since October, 1926, Asir has been under the Sultanate of Nejd.

(5) **IMAMATE OF YEMEN.** The area of this state is about 75,000 square miles and the population is variously estimated at from two to three millions. The capital is Sanaa, with a population of about 25,000. Cereals and coffee are produced extensively. Hides form one of the chief articles of export. Ruling Imam in 1928, Yahya Mohammed Hamid ed-Din.

(6) **SULTANATE OF KOWEIT.** This territory, subsidized by the British, is on the northwestern coast of the Persian Gulf, and has an estimated population of 50,000. Sultan in 1928, Ahmed ibn Jabir al Subah.

In addition to the above there are comprised within the limits of Arabia the British protectorate of Aden and the Sultanate of Oman, also the emirate of Kerak or Transjordan. (See **ADEN, OMAN, TRANSJORDANIA**).

HISTORY. Arabia passed through a fairly quiet year, considering the miscellaneous collections of tribes and nationalities that compose the kingdom of Ibn Saud. On the last day of the year it was reported in the press that he had decided to resign his kingship and become an ordinary citizen of his country. The leaders of the opposition as well as his own followers pleaded with him not to take this radical step. The report stated further that he had acceded to the wishes of his petitioners and had decided to remain as king but with the understanding that he was to have virtually a free rein in the conduct of the kingdom. Possibly Ibn Saud's resignation was a

dramatic move to bring about the desired end it accomplished.

Early in the year there were reports of several uprisings against the King and his Government because of the heavy taxation and there were many sensational reports to the effect that Saud was contemplating an attack on British territory in Palestine, Transjordan, and Mesopotamia, because he believed that these territories were controlling territory that actually belonged to himself. Nothing serious came of these reports, however, although several conferences were held between British authorities in the mandated territory and Ibn Saud, without reaching any satisfactory agreement over the control of the borders.

ARBITRATION, INDUSTRIAL. See LABOR ARBITRATION AND CONCILIATION.

ARBITRATION, INTERNATIONAL. Treaties of arbitration were negotiated by the United States in 1928 with the following countries: France, signed Feb. 6, 1928; Germany, signed May 5, 1928; Italy, signed Apr. 18, 1928; Finland, signed June 7, 1928; Denmark, signed June 14, 1928; Austria, signed Aug. 16, 1928; Czechoslovakia, signed Aug. 16, 1928; Poland, signed Aug. 16, 1928.

Treaties of conciliation were negotiated in 1928, with the following countries: Germany, signed May 5, 1928; Finland, signed June 7, 1928; Austria, signed Aug. 16, 1928; Czechoslovakia, signed Aug. 16, 1928; Poland, signed Aug. 16, 1928.

Appointments to the Bryan Peace Commissions (see YEAR BOOK, 1927) were made in 1927 and 1928 as follows: On the *Franco-American Commission*, Senator Underwood as American national member, on the *Anglo-American Commission*, Senator Lenroot, as American national member; M. Jusserand, as American non-national member, on the *Norwegian-American Commission*, M. Hadji Mischeff, Bulgarian Minister in London, as American non-national member, and M. Edwin Alten, Justice of the Supreme Court of Norway as Norwegian national member.

The text of a series of model conventions for the pacific settlement of all international disputes was adopted by the Committee on Security and Arbitration of the League of Nations at Geneva in July. The idea of the conventions was that general signatures would hasten disarmament. The conventions provide for recourse to conciliation in the first instance and, if that fails, provide that all disputes shall be settled by judicial means or arbitration.

Detailed discussion took place at this third session of the committee regarding the various conventions for arbitration, conciliation, and security that would provide alternatives for war. Work was continued on the principle that, important as were the multilateral treaties to outlaw war, it was still highly desirable to take every possible step to make war both unnecessary and unprofitable. In addition to drafting these model bilateral conventions, on the same lines, the committee devoted itself to the study of the German proposals for the strengthening of the means of preventing war. From the last named was drawn up a model treaty whereby the signatory nations undertake, in the event of a dispute arising between them and being brought before the council, to apply the provisional recommendations of the council relating to the settlement of the dispute and designed to prevent any measures being taken by the parties which

might have a prejudicial effect on the execution of an arrangement proposed by the council, and to refrain from any measures which might aggravate or extend the dispute. In the event of hostilities breaking out, the parties undertake to comply with the recommendations which the council may make for the cessation of hostilities, prescribing in particular the withdrawal of forces having penetrated into the territory of another state or into the demilitarized zone.

This model treaty was adopted by the committee on first reading and submitted to the various governments with the request that they give the instructions to their delegates to the next Assembly, where the reports of the Arbitration and Security Committee was to be discussed. In regard to the question of financial assistance for state victims of aggression, the committee emphasized its importance and value as a means to security and disarmament. Also, the committee felt that states not members of the League might participate in treaties of non-aggression and mutual assistance. At this session Turkey was represented for the first time, but up to the end of 1928 the United States had not taken part in this work.

An Italo-Turkish treaty of "neutrality, conciliation, and judicial regulation" was signed in Rome on May 30. It was the result of negotiations which had been in progress between the two countries for some time. An impetus to these negotiations was given early in April, when the Turkish Foreign Minister, Tefik Rushdi Bey, on his way from the meeting of the Disarmament Committee at Geneva, had an interview in Milan with Premier Mussolini. Several important questions were discussed at the Milan meeting, notable among them being that of Turco-Italian relations, Turco-Russian relations, and the possibility of Turkey's entry into the League of Nations. The treaty consists of five articles, while the annexed protocol, dealing with the machinery of conciliation and arbitration, contains nine articles. The treaty was to remain in force for five years after ratification, which was to take place as soon as possible, and, if not denounced six months before the expiration of this term, the treaty would remain in force for a further five years.

A treaty between Spain and Portugal, providing for the obligatory arbitration of all disputes without exceptions, was signed January 21.

The arbitration of the question as to the sovereignty over the island of Las Palmas, submitted to arbitration by the United States and the Netherlands in 1925 was decided in favor of Holland on April 2. Prof. Max Huber, a Swiss statesman, acted as arbitrator. The island is a small one lying between the Dutch East Indies and the Philippines.

The boundary between Panama and Costa Rica, which had been in dispute since 1921, was the subject of direct negotiations between the two governments, and would probably be settled amicably very shortly.

Copies of draft treaties of arbitration were handed by the United States Secretary of State to the ambassadors of Germany and of Spain on March 12, thus beginning negotiations for treaties with those countries, similar to the treaty with France, just signed.

Newton D. Baker was appointed by President Coolidge to be a member of the Hague Court

for International Justice in succession to the late Oscar S. Straus. The other three members were Elihu Root, John Bassett Moore, and Charles Evans Hughes.

The Hague Tribunal appointed Prof. M. Sindball, formerly of the University of Copenhagen, as arbiter of the Mexican-American Claims Commission, succeeding Rodrigo Octavio, of Brazil, who resigned after the famous Isabel decision favoring Mexico and subsequently Dr. C. Van Vollenhoven, the Dutch jurist, also withdrew. The two governments unable to agree on the appointment of an arbiter, referred the selection to The Hague Court. Professor Sindball was a former Minister of Justice of Denmark.

The ancient boundary dispute between Guatemala and Honduras at the end of the year was no nearer settlement than it was when the United States undertook to effect a pacific adjustment. Secretary Kellogg's proposal that the two countries submit their claims to arbitration before the Central American Tribunal, established under the 1923 treaty, was accepted by Guatemala on July 18, but in August Honduras rejected it, on the ground that the "make-shift" organization of the Tribunal unfits it for that purpose. The American State Department was disappointed by this failure, and it was suggested that Honduras might be given time to reconsider its decision. No comment was made on the offer of Honduras to accept arbitration by the President, or Chief Justice, of the United States or any other tribunal established in permanent or regular form.

TACNA-ARICA. According to an announcement of the United States Department on July 13, Chile and Peru had accepted unconditionally the suggestion of the United States that they resume diplomatic relations. On October 10, the Secretary of State announced that the Tacna-Arica Boundary Commission, which for three years had been trying to fix the boundary between Peru and the northernmost province of Tacna, would be suspended for four months. It was expected that the resumption of diplomatic relations after 17 years of separation between the two countries would enable them to settle their long-standing dispute through the ordinary diplomatic channels.

In a statement in July, Foreign Minister Conrado Gallardo expressed Chile's recognition of the generous invitation of Secretary Kellogg and announced that:

Chile is marching directly to seek an accord with Peru by new ways and to make firm the bases that make for greatness and prosperity of both peoples.

We have lost forty years in Byzantine discussions and the national economy of both countries has sacrificed thousands of millions because commercial interchange has been almost nothing, even though Chile has bought from Peru to the value of 500,000,000 pesos during the last ten years.

The initiative of 1921 was unfortunate and an exchange of notes produced only an agitation of public opinion in both countries. The agreements at Washington and plebiscitary gestures resulted in separating Chile and Peru more than the previous diplomatic offensive which neither won the support nor the favor of sensible men.

Today we want to attain the solution by different methods, creating a cordial atmosphere, interchanging friendly ideas privately without magniloquent speeches, but with serious thought.

In Peru a speech delivered in the Chamber of Deputies by Representative Carlos Valverde, of the Commission of Foreign Relations, is said to have voiced the opinion of his Government. Mr. Valverde is quoted as saying:

Peru gives a new proof of its pacific policies in accepting the suggestion advanced by the arbitrator, though it is thoroughly convinced, as is the arbitrator, that this step does not affect our rights. Peru hopes that Chile will reciprocate with the same sincerity and lofty purposes, in order to reach a solution harmonious as well as just. We trust that Chile will not hold on to her past mistakes. Times have changed. An irresistible current of harmony sweeps over the Americans, and nobody can oppose it without falling into an abyss. We have faith in the solution of the conflict because we know that our rights will be well defended by our Government. Let us, then, welcome the resumption of relations and welcome also the Ambassador of Chile if he brings with him, as the American continent and ourselves hope, peace and justice. The hour of continental justice and harmony is approaching, and our duty is to cooperate to this end.

The Peruvian Congress approved unanimously the creation of an embassy in Chile, and voted at once the necessary credits. Chile opened to trade the frontier between Tacna-Arica and Peru, which was closed when plebiscite proceedings were in preparation.

See **KELLOGG TREATIES; LEAGUE OF NATIONS. BOLIVIA-PARAGUAY DISPUTE.** This controversy which late in the year began to assume a serious aspect as discussed under **BOLIVIA**, section on *History*.

TRIPARTITE CLAIMS COMMISSION (United States, Austria, and Hungary). The United States in 1921 negotiated separate peace treaties with Austria and Hungary in terms similar to those of the treaty with Germany (see **YEAR BOOK FOR 1927**). Hon. Edwin B. Parker, of Houston, Texas, was the sole commissioner selected by the three governments to pass upon the claims; he also was serving as War Claims Arbiter appointed by the President under the Settlement of War Claims Act of 1923 adjudicating claims of German, Austrian, and Hungarian nationals against the United States for ships, patents, and a radio station taken over by the United States during the World War, and was also umpire of the Mixed Claims Commission, United States and Germany. Robert W. Bonyge, of New York, was American agent, representing the Government of the United States on behalf of the claimants; Dr. Alexis de Boer, of Budapest, and a judge of the supreme court of Hungary, was Hungarian Agent; and Dr. Ernst Prossinagg, of Vienna, the Austrian agent, the latter two defending the cases on behalf of their government. Over 90 per cent of the cases (1631 in number) had been disposed of and the commission was hopeful of winding up its task by the end of 1928. The commission had issued administrative decisions disposing of the more important questions, following generally the decisions of the umpire of the Mixed Claims Commission, and opinions in individual cases which would serve as a guide in disposing of groups of similar claims. It was estimated that the awards would not exceed \$1,000,000 against Austria and \$500,000 against Hungary, including interest through 1928. These awards were to be paid through the Treasury of the United States under the Settlement of War Claims Act of 1928.

CLAIMS AGAINST GREAT BRITAIN. The claims of American citizens against Great Britain had received the earnest consideration of the Department of State since the conclusion of the War. An exhaustive examination of these claims, particularly those arising out of the War, was made and completed before the Agreement of May 19, 1927, was concluded. The announcement of the terms of the agreement was released on

May 31, 1927. In addition to the announcement which appeared in the public press, a copy of the agreement was sent to each claimant of record, together with a letter inviting attention to the terms of the agreement and to the status under the agreement of the claim in question.

No mode of procedure other than that indicated by the text of the notes was prescribed. The department considered each claim filed with it, solely on its merits as developed and established by the claimant in the same manner as it considered the claims against other foreign governments. Claims not susceptible of development and proof under the recognized principles of international practice and the terms of the agreement are disposed of by the department after investigation and study and the reasons for the disposition communicated to the claimants in the form of a letter. Claimants, however, are free in all cases to file amended claims and further proof. When any particular claim is developed in all its several aspects and proved to be meritorious in accordance with the terms of the agreement, appropriate action is taken by the department as contemplated by the agreement. See KELLOGG TREATIES; LEAGUE OF NATIONS; WORLD COURT.

ARBORETUM. See FORESTRY.

ARCHÆOLOGY. If possible the year 1928 witnessed greater activity in archæological exploration than ever. At Sakkarā, near Cairo in Egypt, excavations on the site of King Zoser's pyramid revealed hitherto unknown chambers in the burial apartments under the structure. One room proved to be filled with a quantity of stone vessels of various shapes, chiefly of diorite and alabaster. Some bore the names of other kings than Zoser. In one of the rooms, all of which were lined with blue tiles, were discovered three limestone stelæ decorated with fine reliefs belonging in the Third Dynasty style of King Zoser. These rooms are practically duplicates of those of the Southern tomb which in all probability was originally intended for the King himself.

South of Assiut the British Museum Expedition has found 250 Badarian burials, which throw considerable light on this little-known period. By these discoveries it has been established that these Badarians are older than the pre-dynastic Egyptians and are not a contemporary influx. Much pottery, some finer than any yet recovered in any other period, has shown up along with flint implements and polished stone axes, and many pieces of trumpet-shaped mouthed vases of black ware decorated with white-filled incisions. Discovery of grain revealed that at this time the inhabitants had become agriculturalists. At Deir El-Bahari, in the area previously occupied by the Cook rest house, was uncovered, at a depth of sixty feet, a quarry in which are the fragments of statues once belonging to Queen Ufatshepsut but diligently destroyed by her husband, Thothmes III.

The tomb of Tutankhamen continued to give up an amazing amount of treasure. The fourth chamber, the last to be opened, showed a condition of extreme disorder occasioned by dynastic robbers. Among the remarkable finds made in the mass of material thrown about at random by the thieves was a small casket covered with an exquisitely cut veneer of ivory. One panel represents the young king and his wife in a

garlanded pavilion. Another interesting discovery was that of a nest of coffins (the outside one about 30 inches long), in the innermost of which, itself of gold, was a small gold statuette. The innermost coffin contained a lock of the queen's hair. In another box were carefully preserved model tools of iron showing that at this time the metal was considered more or less precious. In the third chamber, Carter made a remarkable find of a fleet of 18 small boats in perfect condition. These were used by the king in passing across the river of death.

Possibly one of the most interesting recent finds in the tomb was that of the king's bow-case, which was over five feet in length and made of a light durable wood covered with fabric which in turn was overlaid with marquetry. The portions in relief are in gold laid in stucco: the flat part is done in different colored barks, leather and even the iridescent sheaths of beetle's wings. The chief subjects represented are taken from the chase. In the case were three composite bows of which the gelatinous cores had dissipated into a viscous state.

At Luxor what seems to be the nucleus of the palace of Rameses III was uncovered. One room seems to have been for the king. In it was a dais for his throne. Adjoining were a bedroom and bath. Next to the king's apartments was the queen's suite also with a large hall containing a dais. There were three apartments reserved for the women of the harem.

At Balata, just east of Nablus in Palestine, the Germans had made discoveries which have modified the view previously held that this was the site of Schechem. The finding of a blunt-topped pyramid 131 feet square and erected on a base 16 feet high was significant. Near it were found cubical cellars, resembling corn granaries. Below the fortifications were found older ruins dating about 1700 B.C. The ruins covered five acres. Evidence appeared to prove that the place, destroyed about 1300 B.C., was not Schechem proper but Migdol Schechem. On Mt. Gerezim the Germans also excavated near to the Samaritan place of sacrifice. Here was uncovered a Christian church dating 384 A.D.

At Beisan, Palestine, the University of Pennsylvania Museum Expedition made discoveries corroborative of the Book of Joshua. The work this year was on the level of Thothmes III, Seti I, Rameses II, and Amenhotep III. The tower fort was uncovered just west of the temple of Amenhotep III. This proved to be the practically complete foundations of a Canaanite fort. In its present condition it consists of four rooms with signs that there was originally another room. The outer walls on an average ran to seven feet in thickness. The main walls of the fort were of sun-dried brick. In the courtyard west of the residence was found a great silo with a capacity of about 9000 gallons. At Beth-Shemesh, Dr. Elihu Grant of Haverford College made discoveries which carry the age of the town back possibly 1000 years. Objects dating from the bronze age were found.

The Palestine Exploration Fund Excavations on Ophel, at Jerusalem, revealed a necropolis which may be the site of the kings of Judah. One of the most important finds was a great gate in the western wall of the City of David. It was flanked by two massive towers, the wall of the northern one being twenty-six feet thick. Diggings on the temple hill brought to light

many jar-handles with short alphabetic inscriptions. By the Sea of Galilee was found a piece of a stele of Thothmes III which speaks of the repelling of the Mitanni. The place of discovery of the stele was Tel el Oreimeh.

At Hazor of northern Palestine, the Liverpool Institute of Archæology was active. The site consists of two parts: a mound where stood the Acropolis, and an open space about 1000 meters by 300 meters, which appears to have been a camp. This enclosure was protected by walls of earth. Most of the material recovered belongs to the bronze age (c. 2000-1600 B.C.). There is not much evidence for the first Graelite period. In the time of Solomon there seems to have been a revival. The walls of King Solomon's time rest upon earlier Canaanite work. In the Acropolis were discovered the remains of a building with monolithic columns. It seems that the place was destroyed about 700 B.C.

Work at Bagdad was continued by the American School of Oriental Research and Harvard University. Already eighty-four rooms, which contained some 1200 tablets, had been cleared. Also the excavators recovered the oldest suit of armor yet found. The site of the excavations is Yargon Tapa, about 350 miles from Ur. At Kish, at the lowest levels, were found pictographic tablets which show that the language is not true Sumerian. This establishes the fact that the first inhabitants of Mesopotamia were not Sumerians. They may have been related to the Elamites. The tablets date before 3500 B.C. Forty-three feet below the surface of the mound were found two chariot wheels dating about 3200 B.C. They were wooden disks about two feet in diameter. Traces of harness were also found.

Near Kharsabad, the American School of Oriental Research of the Guggenheim Foundation and Dropsie College cut a trench through the mound on this site. Three civilizations were revealed. From the lowest level came painted pottery of the first culture of Ur and Suza. Also appeared figures of a steatopygas goddess and a string of five ivory beads. Traces of child burials also were discovered. The second stratum still belonged in the stone or æneolithic age, preceding the bronze age. The ware of this period was incised and not painted. At the top of the level representing this stage was found a temple of baked brick with a garden and traces of a water system. A number of votive toys, including a covered wagon of clay drawn by dogs, were found. The third stratum brought a people who destroyed the culture of the temple period. The city is now surrounded by cyclopean walls. This is the beginning of the bronze age, about the time of Sargon I (c. 3750 B.C.).

The most spectacular finds in Mesopotamia have been made on the site of ancient Ur. Here was discovered the grave of Mes-Kalamdug, in which were four fine gold vessels: two plain, two fluted. The plain one was a lamp, the other was a beautiful cup. These are among the first gold finds made in Mesopotamia. But most remarkable of all was a twelve-stringed harp and a chariot. The upright part of the chariot was sheathed with gold. The sounding box of the harp was decorated with mosaics. On either side of the chariot were three golden lion heads with manes of lapis lazuli and shell. On the pole a rein-ring of silver surmounted by a realistically designed donkey. The work belongs

to about 3500 B.C. Further exploration brought to light a large pit. On a ramp leading down to it was found the bodies of six soldiers who had been slain to act as guards of the king, who was buried nearby. Two clumsy four-wheeled carts (at least traces of them) turned up at the end of the pit. The wheels were solid wood with leather rims. There were three oxen to each cart, and dead grooms lay by the animals' heads. Across the seats were the bodies of the drivers. Elsewhere around the pit were the skeletons of some fifty other persons sacrificed to supply the needs of the dead master. Near the tomb proper lay eleven women of the harem dressed in full regalia. Over the bodies were two statues of bulls of wood with copper and gold heads. The tomb itself was arched with brick and terminated in an apse with a semi-dome. These are important bits of architectural evidence.

Probably the most spectacular discovery was that of the tomb of the Queen, Shub-ad, from which was recovered her remarkable headdress of gold, made up of leaves of willow and mulberry with the petals inlaid with lapis and white shell. This tomb was next to that of the king and had been undisturbed. About 150 objects were recovered from it. About the only thing left by robbers in the king's tomb was a complete little silver boat.

In Persia, Prof. Ernst Herzfeld reported that he had discovered the site of the city of Pasargadae. It is identified as standing on a plateau ten miles square overlooking the plain of Marghab. The place consisted of three separate areas, separated by some kilometers. One of these areas belonged to the palace, another to the temples, while the third was the town proper. Four palaces stood in a spacious walled park. The temple was constructed with six stages or terraces.

At Argos in Greece, Dutch scholars found a stele dating 450 B.C., which contains part of an inscription embodying an agreement between Knossos and Tylessos in Crete. Argos acted as arbiter. The inscription states that should either be attacked by an enemy who proved to be a friend of the other, this other shall remain neutral. Otherwise each shall come to the other's help. Out of the sea, off Artemesium has been brought up a bronze Poseidon 8 feet in height. Excavations near the home of Isadora Duncan in the suburbs of Athens brought to light a grave stele of the fifth century suggesting that here was an unknown cemetery.

At Corinth Dr. Shear continued his work upon the main street heading from the theatre to the market-place. It is 12 feet wide with sidewalks 3 feet wide raised 8 inches above the level of the road. The street is paved with pink limestone. Besides this, the season's work completely uncovered the stage of the theatre and the east parados as far as the exit. The walls of the parados were found preserved to a good height. Nearby was found a life-sized marble statue of a Roman Senator dating in the fourth century A.D. The parados was found to open into a paved street some 60 feet from the orchestra. This street ran north and south at right angles to the parados. To the north this street opens out into a plaza 14 x 17 meters. About 5000 bronze coins were found in a stratum of burned material lying above the pavement for a distance of some 10 meters from the parados. The coins so far cleaned date from the second to

the fourth centuries A.D. Besides the theatre, thirty-three undisturbed graves were opened in the cemetery to the northwest of the theatre. From them came about three hundred various objects. They date from the sixth to the fifth centuries B.C.

In the island of Cyprus the Swedish Archaeological Expedition opened twenty-three graves of the early and middle copper age (3000-1600 B.C.). Two are important. In one were bodies of noble warriors. In the other a royal burial. In the first were 33 weapons. From the tombs came evidence that colonists came to Cyprus in the copper age from Asia Minor. There is also evidence that Mycenaean Greeks came in before the close of the Mycenaean age.

The most notable excavations conducted in Greece in 1928 were those under the direction of Prof. David M. Robinson of Johns Hopkins University. The work was made possible by friends of the University. The site chosen is that of Olynthus located about forty miles south of Saloniki, in Macedonia. It was found that the city covered at least three hills and had a population of probably over 50,000 people. The excavations supplied valuable data for the history of Greece in the fifth and fourth centuries B.C. At the south end of the first hill was found an important neolithic settlement with a prehistoric kiln and much small material. The chief ruins, however, are those of houses of the period from 479-349 B.C., when Philip destroyed the place. No Hellenistic or Roman remains appeared. The chief areas dug were the fortress, the agora, the factory area, and the wealthy residential part. The barracks were often stored with huge vases about six feet high. In the shops were found about six hundred coins which had been dropped when Philip's soldiers broke in to loot. The residential quarter was the most interesting. There was uncovered a fine street 10 feet wide with gutters on either side. Complete plans of at least eight houses have been recovered. In the houses were found beautiful red-figured vases. One house had a little museum for vases, and a bath room. Several bath tubs were discovered—a sort of prototype of a Victorian hip-bath. Mosaics also were found in some of the houses. The work lasted from February 17 to June 2.

At Canosa, in Italy, several tombs were found. Three contained gold objects. One skeleton seems originally to have been wrapped in a fabric made of asbestos and embroidered with gold. At Casenga, a huge Roman building has been excavated. In it were found many bronzes, vases, etc.

During the winter most of the work at Herculaneum consisted in removing the fifty feet of hardened mud which covers the site. The major efforts were centred upon an imposing building which was located in February. Excavated as far as the ceiling of the first floor, it seems to have been a public office. It was a large structure running on three sides of a rectangular plot. A portico looks upon what was probably a garden. The rooms already cleared show mosaic floors, frescoes, and elaborate stucco decoration. At the windows were artistic iron grilles. A wooden staircase almost intact was found. A number of pieces of sculpture were discovered.

The first story of the House of the Skeleton was cleared to the height of five meters. It has a balcony overlooking the lower part.

Excavations at Perugia revealed parts of the Etruscan city wall and what appear to be parts of an Etruscan temple. At Piombino an Etruscan tomb of the seventh century was located. It is cylindrical and surmounted by a conical dome which overhangs the tomb to keep off the rain. Inside were four sarcophagi with remains of skeletons and jewelry, four helmets, two shields and many knives and spears.

In Rome, Ricci, in demolishing the Caserma di Magnapapoli, found that the building was really an ancient Roman structure. It stands to the height of three stories and seems to have been a kind of stock exchange. Twelve shops are still preserved in the first floor and others on the second; on the third a large hall about fifty feet high. The staircases and galleries are in good condition. Near Tivoli, Parabeni found a head of a girl which he believes to be a copy of a work by Calamis. It came from Hadrian's Villa. At Liptis Magna (Africa), Bartoccini was engaged in clearing the amphitheatre.

At Buetzow, in Mecklenburg, workmen in digging a cellar found a stone circle with markings showing careful observations on the sun's positions at various seasons of the year. The ruins are dated in the twelfth century B.C. At Gräsbjerg, in Austria, excavations in the neolithic site continue revealing hitherto unknown civilizations. Some of the pits were found to be houses. Bones of sheep, pigs, horses, dogs, rarely bears, and also fish were found. At Guntramsdorf, near Vienna, three Celtic graves of the La Tène epoch have been discovered.

Near Seville, in Spain, a Roman road was uncovered on the site of ancient Italica, also the foundations of a Roman house with fine mosaic floors.

England was fairly active in archaeological exploration. At Bournemouth (Haddens Hill), sixteen bronze-age burials were found. At Caerhun, excavations on the site of the Roman fort of Kanavium continued. The *prætentura* was located, and the south gate cleared. In the governor's house were found coins of the time of Domitian, Nerva, and Trajan. The *prætorium* also was uncovered. At Chester a Roman fort was found in the Deanery field. Foundation walls, floors, and hearths of individual rooms were exposed. At Sydney, on the Severn, a Roman temple of the otherwise unknown god, Nodens, was found. This deity seems to have been a god of the chase. The temple was erected as late as the fourth century A.D. It includes a triple shrine. At Mount Vernon, near Glasgow, was found a bronze-age cemetery. The site dates about 4000 years ago.

ARCHITECTS, THE AMERICAN INSTITUTE OF. The national organization of the American architectural profession, founded in 1857. It is governed by officers and a board of directors elected by and responsible to the delegates from the 58 chapters, assembled at the annual convention. The objects of the Institute are to organize and unite in fellowship the architects of the United States, to combine their efforts so as to promote the aesthetic, scientific, and practical efficiency of the profession, and to make the profession of ever-increasing service to society, and to spread an understanding of art and service among the people. Its activities include: devising methods for improving and extending architectural education, not only in the universities but in the lower schools; secur-

ing proper laws for the registration of architects in the various States; developing a service for architects which will give them for their actual problems data relative to building materials and methods obtainable from no other source; maintaining a public information service to tell the prospective builder the financial as well as the aesthetic service of the architect. The Institute maintains active standing and special committees on various branches of its work and allied fields. The directors and executive committee hold quarterly meetings in various parts of the country and the regional directors keep in active touch with the work of local chapters throughout the year.

At the sixtieth and sixty-first annual conventions of the Institute, a large measure of attention was given to the discussion of architecture as an art and to the development of a plan for bringing about real working collaboration between the architect, the landscape architect, the painter, the sculptor, and the craftsman. At the sixtieth convention, held in 1928, the board of directors reported that under the conditions of the French Traveling Fellowship, through the gift of Julian Clarence Levi, of New York, the second appointee, Maurice Chauchon of Paris, was in the United States to study. Recommendations were made by the committee on public information relative to the constructive development of the publicity system inaugurated in 1926, and another report was rendered, by the committee on the plan of Washington and Environs, calling upon the local chapters to do their part in influencing Congress to effect certain improvements to insure the future greatness of the National capital.

The committee on education reported on the art courses given under the grant of the Carnegie Corporation, by which the Institute received \$10,000, which enabled the committee to invite 20 colleges to take courses at the Fogg Museum of Harvard University. Under this plan colleges were invited to send to Harvard their best art teachers, to receive a special intensive course in the fine arts, which they in turn were to reproduce in the following year to the students in their institutions, in an effort to educate the public to a more intelligent interest in and knowledge and appreciation of architecture and the other fine arts. In addition to the reports of the various committees, numerous lectures and addresses were given as follows: Walter S. Brewster on "The Layman as Architectural Collaborator"; Royal Cortissoz on "Tradition"; Everett V. Meeks on "Collaboration Between the Arts in Art Education"; Ferruccio Vitale on "Environment in Relation to Architecture"; and F. R. Watson on "Ideal Auditorium Acoustics."

The endowment fund capital of the Institute amounted to approximately \$75,000, the income from which was devoted to the maintenance of the Octagon House in Washington; the property and funds totaled \$338,625.87, of which \$46,176.16 belonged to the Waid Educational Fund, the income being used to defray expenses of lecturers sent out to various States and to preparatory schools. An additional \$3000 was added to the fund through the gift of D. Everett Waid. The Allied Art Medal of the Institute was awarded to H. Siddons Mowbray, posthumously, for distinguished achievement in mural painting, and the Craftsmanship Medal to William D. Gates

for distinguished achievement in ceramic art. The membership numbered more than 3000 of the 10,000 practicing architects in the United States. The following were made Honorary Corresponding Members: Bernado Morales, of Santiago, Chile; Alberto Coni Molina, Paul J. Alvarez, Francisco Squirru, and Raul J. Fitte, of Buenos Aires, Argentina; H. P. Cart Loxontaine, London, England; M. Littman, Stuttgart, Germany; and Peter Behrens, Vienna, Austria; while 10 Honorary Members were announced.

Officers for 1928-29 were: President, C. Herrick Hammond, Chicago, Ill.; first vice president, J. Monroe Hewlett, New York; second vice president, Wm. J. Sayward, Atlanta, Ga.; secretary, Frank C. Baldwin, Washington; and treasurer, Edwin Bergstrom, Los Angeles. The Institute publishes the *Journal of the American Institute of Architects*, a monthly; the *Handbook on Architectural Practice*; a *Structural Service Book*; *The Significance of the Fine Arts*; the *Standard Contract Forms*, which are in widespread use throughout the country; and documents on the ethics of the profession. Its headquarters are located in the The Octagon, Washington, D. C.

ARCHITECTURE. The movement toward a free and modern type of architectural design so noticeable in Europe during the past few years has continued unabated during 1928, and so extended its influence as to be one of the great dominating forces in architecture throughout the world; particularly marked was the progress of this movement in America. This has not meant, however, the uncritical acceptance of the more extreme and doctrinaire types of modernist fanaticism; on the contrary, in many parts of the world the more angular and mechanistic types of modern building have tended to disappear; the movement is gradually being realized as a force that liberates design from slavery to archaeology and cultivates free creation without necessarily imposing a new servitude to so-called modernistic detail.

AMERICA. Building conditions were erratic; some localities boomed, some slumped. In general, the tendency was toward a reduction in the amount of speculative building and an increase in other fields; the overbuilding of the past few years in certain types of work caused an inevitable reaction; moreover, the tremendous bull market on the New York Stock Exchange during the autumn absorbed large amounts of cash which would ordinarily have gone into new building.

Nevertheless, the construction of office buildings continued; in certain places it even increased, as, for instance, in the enormous change that was going on in the Grand Central Terminal zone in New York, where one fifty-six story building was nearing completion and several others, almost as large, and one even higher, were under construction.

The most remarkable of these office buildings is the Chanin Building, by Sloan and Robertson. In this, setbacks from a rectangular base lead to a high tower whose deeply buttressed top is the most successful part of the composition. The whole is treated in a boldly modernistic manner, with a frieze of gigantic, conventional foliage near the bottom, whose scale and relief seem ill-related both to the simple brick piers above, and the delicate, ornamented bronze band below. Much more conventional, but more

convincing, because of the perfect harmony of the material and its detail, is the lavish, Gothic, limestone-faced mass of the building for the New York Life Insurance Co., by Cass Gilbert, on the site of the old Madison Square Garden. This, detailed in a free, late Gothic style, is particularly happy in the simple yet elegant treatment of its lower portion and the arrangement of its first setbacks; the central tower with its pyramidal top is less sure in silhouette.

Quite as lavish as the New York Life Building is the Fisher Building in Detroit, by Albert Kahn. This enormous structure is brilliantly massed, with rhythmically designed setbacks leading up to a superb tower. Within its walls are contained, not only a large office building, but also a moving-picture house seating 3000 people (the theatre designed by Graven and Mayger) and an eleven-story garage with space for over 1000 cars. The whole is built with the greatest richness of material and there is an exceptional use of color. It is a brilliant and beautiful thing.

In Cleveland, an office building was combined with the railroad station—the Terminal Tower Building, by Graham, Anderson, Probst & White. It has a strong and simple outline with a top distinctly reminiscent of the Municipal Building in New York, and is treated in a dignified and monumental classic style. Noteworthy also are the Toronto Star Building in Toronto, by Chapman and Oxley, and, in Montreal, the building of the Royal Bank of Canada, by York and Sawyer and S. G. Davenport, Associated. This is typical of the American bank tradition, monumental, classic, well proportioned, and dignified, based strongly on Italian Renaissance precedent.

The most noteworthy of the industrial buildings are the Mail Order Stores Building of Sears, Roebuck & Co., at Los Angeles, by George C. Nimmons & Co., and the Schrafft Candy Factory at Charlestown, Mass., by Lockwood, Greene & Co. The Sears, Roebuck Building is of a simple and direct modernistic type of concrete design, with an effective cresting and tower; the Schrafft factory is in modified Gothic, admirably suited to its fenestration.

Few important hotels or apartment houses of unusual distinction were completed during 1928. The Bismarck Hotel in Chicago, by Rapp & Rapp, has effective modernistic interiors; the Barbizon, in New York, a hotel for women, by Murgatroyd & Ogden, has a mass building up beautifully to a central tower, with detail of modified Italian Gothic character; the Biltmore at Santa Barbara, by Reginald Johnson (awarded a medal at the New York Architectural League Exhibition) is low, rambling, exquisitely proportioned, with Spanish baroque detail. The New York Athletic Club's new building, by York & Sawyer, solves a problem somewhat similar to that of a hotel, in a massive, Italian Renaissance structure, whose great virtue is the simple bigness of its detail and the frank expression of its function, by means of loggias and windows of varying sizes. Entirely different in character and an almost perfect country hotel, the Lord Jeffery Inn at Amherst, Mass., by Putnam & Cox, has an unobtrusive, late colonial informality that carries on beautifully the tradition of the college town in which it stands. The Masonic Temple at Dayton, Ohio, by Herman & Brown, is a dignified example of the purely classic type. Particularly

effective is the great pedimented colonnade of the entrance motive. Unqualified doctrinaire modernism characterizes an apartment house in Los Angeles, by Richard J. Neutra. In this, perhaps for the first time in America, the horizontal bands of windows, so common in German work, are boldly used; the whole obviously owes much to the inspiration of the work of Eric Mendelsohn.

By far the most important public building of the year in the United States is the City Hall of Los Angeles by Austin, Parkinson & Martin. This solves satisfactorily the difficult problem of combining the enormous amount of administrative office space with a dignified council chamber and suite of executive offices. In general scheme this building consists of a large, lower portion, rectangular in plan, with a high, central tower for the municipal offices. The detail is freely classic, with touches of Romanesque feeling, and the whole has a dignity and monumentality befitting its purpose. The large municipal auditorium of San Antonio, Texas, by Ayres, Ayres, Willis & Jackson has a particularly interesting entrance motive with an arched loggia flanked by towers, the whole treated in a simple and direct Spanish baroque style.

In the New Britain, Conn. war memorial, H. Van Buren Magonigle has succeeded by rigid restraint in producing a powerful emotional effect with the simplest of means. The memorial consists of a heavy polygonal shaft on a circular plaza. The shaft is capped with a great modernistic eagle, and the plaza entrances flanked by large, simple urns, in which are concealed flood-lighting devices for lighting the whole at night. The year also saw the completion of the memorial to the late President Warren G. Harding at Marion, Ohio, by Henry Hornbostel & Eric Fisher Wood, which consists of a large circle of unfuted doric columns, Greek in inspiration.

Among the school and college work, the Bixby Hall of Fine Arts, Washington University, St. Louis, by Jamieson & Spear, is noteworthy for its reduction of basically classic ideas to their simplest terms. The result is straightforward and beautifully proportioned, and the restraint pleasing, though austere. It is, however, a distinct departure in style from the earlier buildings, which are all in Early English Renaissance; its harmony with them is only a similar approach to the style problem and a similar restraint in detail. The Science Building for the College of New Rochelle, N. Y., by McGill & Hamlin, is in a much modified collegiate Gothic, with the large laboratory windows framed in deep buttresses and a dominant arched entrance. The Senior High School at Reading, Penn., by Ritcher & Eiler, is interesting in its contrast of long, low mass with a central entrance tower.

The most unique educational group of the year is the Cranbrook School at Cranbrook, Mich., by Eliel Saarinen. This, a lavish boarding school group, has been handled with masterful freedom. In no sense a piece of mere eccentricity, it makes the most of simple roof and wall surfaces, careful fenestration, and expressive use of materials and occasional bits of original and delightful carving.

The Concordia Lutheran Seminary, at St. Louis, by Day & Klauder, continues the high quality of educational work for which this firm is famous. It is in a free and beautiful Gothic,

LOS ANGELES, CALIFORNIA
Austin Parkinson & Martin, Associated Architects

AMERICAN ARCHITECTURE OF 1928

with details of great variety and interest. The simple, upward sweep of the tower is particularly fine.

The new work by Cram & Ferguson, on the Cathedral of St. John the Divine, New York, continued swiftly. Not only did the nave approach completion, with the building of the vault and the roof, but the west front was carried up to the top of the porches and the north transept begun. The baptistry was also finally completed and forms an exceedingly interesting interior, with its frieze of polychromed, heraldic ornament and the rich, interlacing ribs of the vault. Among other ecclesiastical work of the year, the Roman Catholic Church of St. John the Evangelist in Brooklyn, by McGill & Hamlin, is distinguished in the simplicity of its brick exterior and rough plaster interior and the sense of height and size given by its slim, pointed arches. Outside, the long, brick side toward the street is received at one end against an arched entrance porch with a low tower and capped at the other by a tall, copper flèche.

The year 1928 was also marked by the completion of the Princeton University chapel, by Cram & Ferguson. This magnificent, large, vaulted church is perhaps the most scholarly and carefully studied modern Gothic building in America. Simple in plan, it is exceedingly effective in the long march of its nave arcade, and its attempt to combine the height and logical directness of the French Gothic with the delicate charm of detail of English Gothic is unusually successful, but, as in the case of almost all such attempts, the interior is more satisfactory than the exterior. An interesting freshness of detail is given by the introduction of Renaissance motives in much of the church furniture.

An enormous amount of domestic work of exceedingly high character constructed during 1928 makes the choice of individual examples difficult. Particularly noteworthy, however, is much work in the neighborhood of Philadelphia by Mellor & Meigs and Robert R. McGoodwin; in New York suburbs, by Peabody, Wilson & Brown and J. C. McKenzie, Jr.; and in southern California by Donald D. McMurray and Reginald Johnson. Frank Lloyd Wright carried to a high degree of perfection his experiments in the use of concrete for houses and in a number of examples near Los Angeles has produced designs not only unique in construction and detail, but beautiful in effect, as well. The general system of construction consists of square, precast concrete units, framed in a mesh of steel reinforcement, and by patterning the units, great richness of effect is economically obtainable. Should this method of construction be equally available for more severe climates, these houses may well prove as epoch-making as they are imaginative.

The opening of the Columbia-Presbyterian Medical Centre, by James G. Roger, and the Psychiatric Institute, by Sullivan Jones (then N. Y. State Architect), a part of the same group, marked the completion of the first great group of combined hospital and medical school buildings designed on sky-scraper lines, in accordance with urban conditions, and because of the congestion of available city land. The group is marked by a distinct cliff-like and deeply shadowed impressiveness; the bold projections of the ward wings and the grouping of the buildings on the hillside unite to produce an effect of height and

strength. Nevertheless, the power of the whole is rather bleak and heartless; the elaboration of carefully planned, mechanical equipment which alone makes such a group possible, is reflected on the outside in a certain mechanistic quality of effect. In detail, the whole is extremely simple, rather inclined toward modernism, but with a slight Gothic flavor. In plan, the group reveals intensive study and many innovations of arrangement, so that the whole is bound to exercise tremendous effect on all hospital building of the future.

GREAT BRITAIN. Commercial and industrial uncertainty was reflected during the year in the lessening of the quantity of building. In London, the Westminster Bank, by W. Curtis Green, has the usual rather complicated classic formality so commonly seen in London architecture. The new building of the Sun Life Assurance Co., of Canada, by Septimus Warwick, is classic, also, but much simpler and more direct. The new Grosvenor House, by Sir Edwin Lutyens, in association with Wimperis, Simpson & Guthrie, is a huge square mass, dignified but undistinguished. The new Empire Theatre is an enormous moving-picture house, seating over 3000 on the floor and one balcony. The whole is designed along American lines, by F. Matcham & Co. in association with the American architect, Thomas W. Lamb. The Arcadia Works, a tobacco factory, by M. E. and O. H. Collins, form an imposing block in a fantastic, modernized Egyptian manner. If the applicability of such an exotic style for a tobacco factory be admitted, the cleverness of this adaptation cannot be denied, and whatever the theoretical attitude may be, the whole forms an amusing and imaginative street front.

Outside of London, the Torbay Hospital at Torquay, by Adams, Holden & Pearson, is noteworthy for the handsome and severe simplicity of its rather conventional brick treatment. It is an excellent example of that type of modern Georgian in which the English are almost universally successful. At Levershulme, near Manchester, a dance hall by Harold Davies reveals the strength of American influence in England today—an influence which an English critic of this building likens to "American faking." The exterior is strongly inspired by the modernized, Spanish colonial of California and the interior resembles an arcaded courtyard with a vault over the central portion. The interior is rather gay, as befits its purpose, but without tawdriness.

The remarkable originality of modern English ecclesiastical architecture is well illustrated in two churches, that of St. Alphage at Hendon, by Nicholas Dixon-Spain, and the Roman Catholic Church of St. Michael at Ashford, by Sir G. G. Scott. Both have simple and rather square exteriors and interiors distinguished by simple directness and lack of ornament, the beauty of effect being gained by the careful handling of the proportions of the structural members.

INDIA AND AUSTRALIA. Work on the great capitol group at Delhi, by Sir Edwin Lutyens and Sir Herbert Baker, was being pressed forward rapidly and the exterior of the legislative building was almost complete. The whole group is interesting in its combination of English classic and Indian forms. Particularly distinguished are the two spreading buildings known as the secretariat buildings by Baker, which flank the central avenue. In Australia the year saw the opening of the first of the provincial capitol buildings

at the new capital, Canberra, from the designs of Walter Griffen. This first building is, like all of those designed for the enormous ultimate scheme, uncompromisingly modernistic and rectangular.

FRANCE. The most important addition to Paris buildings was the great new concert hall known as the Salle Pleyel, by Auburtin, Grasset & J. B. Mathon. This consists, not only of an enormous concert hall seating over 3000 people, but also two smaller recital halls and the rooms of the Pleyel Society, combined in a plan of customary French brilliance. The façade is severe and rectangular, but the variation of rectangular and octagonal windows gives a note of interest. The interior of the great hall is entirely in sweeping curves, laid out according to the most recent acoustical knowledge. The result is a rather egg-shaped form, exceedingly difficult to treat, and lacking in scale. There is an interesting frieze around the bottom by the decorator, Jaulmes.

In ecclesiastical architecture the most interesting two designs were those of St. Pierre, at Chaillot, by Émile Bois and Notre Dame de Loc-Maria, at Quimper, by Charles Chaussepied. The first of these is an ambitious scheme of a great rectangular base carrying five domes and entered by a triple portal in a triangular-topped, pediment-like frame; at one side there is a slim tower, whose chief feature is a colossal crucifix in the centre of the front. The treatment of the whole is entirely modern, yet strongly influenced by the Romanesque of central France. The other is a much smaller, country church of brick with a low, central tower; it has much of that direct, informal charm so characteristic of the traditional French rural churches.

The country club, La Festa, at Monte Carlo, by C. Letrosne, has a beautiful casino plant with a magnificent, terraced, tennis-court lay-out, the whole designed with an exquisite sense of the site and the view as well as a charming sense of the materials used. The detail is rather classic in feeling but much modernized and the effect of the whole, rich, without being in the slightest degree ostentatious. Somewhat similar in feeling was the casino at Évian, by J. Hébrard. The large central hall shows a rather playful version of neo-Byzantine style; interlacing arches and penetrating vaults carry a large dome, whose base is pierced by a ring of windows. Despite unnecessary complexities in the vaulting arrangement, the general interior effect is quite delightful.

A large new bridge at Plougastel, by Limousin & Freyssinet, is a remarkable example of the light gracefulness of structural form possible in reinforced concrete. It consists of three spans of almost 600 ft. each, and each span is made of one great arch, beautiful in curve and of much delicacy. The crown of the arch is about 125 ft. above the water. This bridge is important, not only because of its inherent beauty, but also because, like the dirigible hangars at Orly, by the same designer, it is a great step forward in the development of the artistic possibilities of a comparatively new material.

GERMANY. The tremendous industrial activity of present-day Germany was reflected in the large amount of building of all types. It is almost without exception modernistic in feeling, although in the more recent work a tendency was observable toward the less extreme types and a growing simplicity with touches of distinct neo-baroque influence.

This tendency was clearly visible in the new Finance Ministry Building at Breslau, by Allesscher—a large, dignified mass, with the traditional German high roof and a garden court behind. In style this is distinctly neo-baroque with the modernistic tendency appearing only in occasional details. In Frankfurt-on-the-Main, a municipal market, by H. Kramer, with an eight-story office building at one end and a refrigerating storehouse balancing it at the other, has a somewhat similar, simple charm; the market hall, itself, has an interesting glass and concrete vaulted roof. Perhaps the most unusual of the German public buildings is the Cologne exposition group, by A. Abel. The main building consists of an old barracks altered into a museum by the most brilliantly simple means, with long lines of vertical piers and a high tower. The interiors are particularly interesting in their simple use of straight lines. Beside the exhibition building proper, there is a lovely terraced layout overlooking the Rhine and an attractive restaurant. A planetarium at Nuremberg, by Schweizer, is starkly simple, but decorates its sweeping wall with interesting diagonal brickwork patterns.

Of the many commercial buildings of 1928, the Hindenburg Building in Stuttgart was interesting in its combination of a planetarium with several restaurant and café rooms, and because it is a step further in completing, in a harmonious manner, the square opposite the railway station finished last year. Its outside is severely simple, but some of the restaurant interiors unusual and interesting. It is by Eitel, Schmoll & Staehlin. Also in Stuttgart there is an unusual store building by Eric Mendelsohn with his characteristic contrasts of long banks of horizontal windows and sharply accented vertical motives. Somewhat similar are two buildings in Berlin by the Luckhardt Bros. & Alfors Anker, in both of which a curved corner is emphasized by a sweeping band of ranked windows.

Ecclesiastical architecture shows, universally, the attempt to create new forms, varying from the somewhat conservative neo-baroque of the picturesque group of the Sacred Heart at Wurzburg, by A. Boslet, a charming, rambling mass of buildings containing a seminary and a church, to the extremely manneristic modernism of the church at Limburg, by J. Pinand, with its hyperbolic vault and fantastic, many-windowed apse. The Heilandskirche at Hamburg-Uhlenhorst, by E. Heynen, is distinguished in its simplicity and the development for form from the direct use of its materials.

Many moving-picture theatres show the tremendous development of motion-picture popularity. They are all, without exception, modernistic, and usually of extreme simplicity in form, depending upon color for richness. The Bieberbau at Frankfurt, by E. J. Margold, and a new theatre in Hamburg, by Karl Winand, are characteristic examples. Karl Winand also produced, in the Fledermaus dance hall at Hamburg, an unusually attractive and playful combination of modernistic forms and colors, for a building of this kind.

Of a great deal of published domestic work, that of Margold in Frankfurt and Rosenthal in Berlin was particularly interesting in its imaginative use of so-called modernistic forms. The Berlin apartment houses, by Rudolf Fraenkel, are quiet, simple, direct; and in Leipzig, Bruno Taut did much work particularly distinguished

THE "MESSEHOF" (RESTAURANT) ON THE EXPOSITION GROUNDS
THE INTERNATIONAL PRESS EXPOSITION, COLOGNE

PRIZE DESIGN FOR LEAGUE OF NATIONS BUILDING AT GENEVA
EUROPEAN ARCHITECTURE OF 1928

by its bold use of color. The most interesting of the large housing developments was the Berlin suburb Zehlendorf, with houses by Klein, Emmerich, Gerlach, Steinmetz, Tessenow, Mebes, Poelzig, and others. Laid out with the customary German care, this development has houses which for the most part are rather blocky, rectangular, and simple. The general effect has the clarity and neat picturesqueness one has come to expect in such developments.

A country school near Dresden, by H. Tessenow, had an attractive open court in the centre and slim arcades around. The whole has real charm. The Gesamtschule at Neukoeln, near Berlin, by Bruno Taut, is chiefly remarkable for the clever way in which its triangular site has been utilized for athletic fields, etc.

OTHER COUNTRIES. Little important work was done in Austria. There, as in Germany, modernism was predominant. In general, the tendency was toward a more rectangular type than that of Germany; the influence of the neo-classicism of Otto Wagner still remained. Typical are the hotels, the Babelhof, by Karl Ehn, and the *Eberthof*, by Mittag & Hauschka, as well as a block of stores and apartments by Oscar Wlack. All of the above are in Vienna.

In Italy, Mussolini's plans for the modernization of Rome had so far produced little new completed building, but they served to lay bare large areas of the ancient Roman city, hitherto hidden, and resulted in the discovery of much Roman work of great importance. Of new buildings, particularly important were the hospital of Sant' Erasmo at Legnano, by C. Bianchi—a long, low, brick building with an interesting entrance loggia of arches in alternating courses of brick and stone, and the church delle Figlie di Ste. Anna, at Rome by A. Pepi, a lavish piece of baroque architecture, with massive marble columns on the interior and an apsidal chancel.

In Czechoslovakia, an important new group of capital buildings was completed at Prague by A. Engel. The main building is of the type so common for parliament buildings, with two wings and a dome; there are also numerous other administrative buildings, a so-called "forum academicum" and a victory monument, taking the form of a column of great height carrying a colossal figure of victory.

In China, the new Nationalist Government revealed an unusual sense of civic responsibility as well as a keen appreciation of the needs of a modern city, in its ambitious ideals for its capital city, Nanking. In this it was their intention, not only to lay out a city plan in accordance with the most modern ideas, but also to develop a great series of government buildings in a modern adaptation of the traditional Chinese style. As a first step they appointed an American architect, H. K. Murphy, as their architectural adviser.

The deadlock which resulted from the competition for the League of Nations building at Geneva, referred to in the architectural article in the 1927 YEAR BOOK, was at last broken, and after an intensive study of the prize-winning designs, the committee in charge has finally appointed as the architects the Paris firm of Nénot & Flegenhimer, with the idea that they should re-study their competition plan, bearing in mind various details from the designs of Lefèvre, Droggi, and Vago. The design thus honored was one of the least radical in the competition; it

is in a straightforward, classic style of great dignity, with a plan beautifully studied, in the French manner, and a magnificent colonnade as the chief feature. The office buildings do not compare in beauty with the central buildings, and it is to be hoped that with re-study they will achieve a more interesting form. There will undoubtedly be much criticism of the choice of such a conservative design, but the effect is bound to be dignified and the plan is monumental and efficient. See also BRIDGES.

ARCTIC EXPLORATION. See POLAR RESEARCH.

ARGENTINA, är'jën-të'nä. A South American republic on the eastern coast of the southern part of the continent, consisting of 14 provinces, 10 territories, and the federal district. Capital, Buenos Aires.

AREA AND POPULATION. The total area of Argentina is 1,153,119 square miles. An official estimate of the population of the republic as of Jan. 1, 1927, based on census of 1914, and the birth, death, and migration records since that time, showed a total population of 10,348,189. According to the census of 1914 (the latest official count), Argentina had 7,885,237 inhabitants. The number of immigrants of 1926 was placed at 113,352 and the number of emigrants at 159,448. Normally immigration and emigration balance due to the influx and exodus of large numbers of Italian and Spanish laborers before and after the harvests.

An interesting study of "Seventy Years of Argentine Immigration," by Professor Alejandro E. Bunge, appeared in the Pan American Union *Bulletin* for October, 1928. This article chiefly stressed the Latin characteristics of the immigrants and emigrants. The 5,740,000 immigrants who entered Argentina from 1857 to 1926, were in the majority, Latins—inhabitants of the States of southern Europe. The Italians and Spaniards alone constitute 79.6 per cent of the total, while the immigrants from all the non-Latin countries form scarcely 15 per cent. Professor Bunge attributes the fact that Nordic immigrants have shunned the shores of Argentina to the similarity of race, language, and customs to be found in the United States and Canada rather than to climatic conditions in Argentina. The Italian immigration was formerly the most numerous. Up until 1870, 70 per cent of all the immigrants were Italians; later this proportion was reduced to 60 per cent, and to-day it remains stationary at about 45 per cent. But the emigration of Italians from Argentina has always been active, amounting to 50 per cent of all the people leaving the country. The Italians seemed to leave the country in great numbers at times of national crises. Spanish immigration as contrasted with Italian shows a steady increase year by year. At first it formed only 15 per cent, just before the World War it rose to 49 per cent, and in the post-war period it has remained at about 25 per cent.

Increases in the non-Latin immigration (Polish, Russian, German, Yugoslav, Czechoslovak, and Lithuanian) in recent years have occasioned an important change in the nature of immigration into the country, and if the proportion continues in the future must produce radical changes in the ethnic composition of Argentina's population. As noted above non-Latin immigration amounted to only 13 per cent of the total. Since the War this proportion has increased

rapidly. It was 19.6 per cent in 1922, 25.2 per cent in 1923, and 30 per cent in 1926.

The population of the larger cities was as follows: Buenos Aires, June, 1914, 1,575,813, and according to the census of June 1, 1925, 2,310,441; Rosario (Santa Fé), 1914, 222,592 (estimated 1927, 410,000); Córdoba, 1914, 134,935 (estimated, 1927, 200,000); La Plata, 1914, 90,436 (estimated, 1927, 169,000); Tucumán, 1914, 91,216; Santa Fé, 1914, 59,974; Mendoza, 1914, 58,790; Avellanda, 1914, 46,277; and Bahía Blanca, 1914, 44,113.

EDUCATION. Under the Ministry of Justice and the cabinet of the Chief Executive of the nation, the school system of the Argentine Republic is centralized. Although certain liberties tending toward autonomy are delegated, as in the case of the university, the popular mind looks to the Federal Government as the source of all good and evil in matters of education, and, strange to say, even in cases of most extreme bitterness and complaint, the demand is for a change of personnel rather than for a reform in system. Elementary instruction is free, secular, and compulsory for children from 6 to 14 years of age. According to statistics, published in 1928, for primary instruction there were 10,608 public schools in charge of 45,271 teachers, with an enrollment of 1,302,534 pupils and an average attendance of 1,031,890. There were 44 national secondary schools, with an enrollment of 15,111 pupils, and 84 normal schools with an enrollment of 13,997. The five national universities, The University of Buenos Aires, La Plata, Córdoba, the Litoral, and Tucumán, had a total enrollment of 15,843 students.

PRODUCTION. The country is agricultural, its principal resources being cereals and animal products. It is self-sufficient in the matter of food stuffs, its prosperity depending upon the surplus production and foreign marketing of these articles. Industrial development, therefore, has followed along the lines of preparation of food-stuffs, and except for meat packing, flour milling, the dairy industries, sugar refining, and other industries concerned with the first stages of the working of raw materials, the manufactures are unimportant and insufficient for domestic needs. The production of manufactured goods was greatly stimulated by the World War, however, the greatest progress having been made in the dairy, tanning, footwear, wool scouring and carding, woolen textile, forest products, wine, and meat industries, and to a lesser degree in the manufacture of cotton piece goods, glass and china ware, tools and light machinery, sacking and cement. A more recent incentive to national industry is found in Argentina's tariff policy, the avowed purpose of which is the protection of home industries using domestic raw materials. At present the chief obstacle to such industries is the lack of domestic fuel. Most of the coal used in Argentina comes from Great Britain and the petroleum supplies from the United States and Mexico. The industries of Argentina are centred in the Province of Buenos Aires, where capital invested in industrial and commercial establishments exceeds \$1,000,000,000.

The total area of Argentina is about 700,000,000 acres, of which about 250,000,000 acres may be used for agriculture, the same for cattle grazing, and approximately 100,000,000 acres represent woodland. About 10,000,000 acres require irrigation. The acreage under wheat in 1927-28

was 19,168,800 acres and the production 6,500,000 metric tons; oats, 2,829,600 acres, 759,000 tons; linseed, 7,051,850 acres, 2,063,000 tons; maize (1926-27), 10,293,600 acres, 8,150,000 tons. The area under sugar is about 237,500 acres and the production in 1927 amounted to 474,256 tons; under the vine 280,000 acres, which produced 90,640,000 gallons of wine. Cotton was planted on 71,746 acres, which produced 42,000 tons. The 1927-28 wool production was estimated at 146,098 metric tons.

In a message of the President to Congress in July, 1928, he stated that agriculture had made still further advances over the preceding year. The area planted to wheat, linseed, oats, barley, birdseed, and corn increased in 1927-28, to 17,338,000 hectares, an area 623,600 hectares larger than the plantings in the preceding year and 4,372,645 hectares greater than that of 1922. Exports of wheat, linseed, oats, barley, rye, and corn, which were 9,373,046 tons in 1926, rose to 15,501,694 tons in 1927. Marked progress was also reported in the number of farms worked by their proprietors, the improvement of processes of cultivation, and the development of coöperative societies, stock raising, and dairying.

Meat refrigeration is the principal industry. In 1926, 430,728 tons of chilled beef, 226,739 tons of frozen beef, and 67,229 tons of frozen mutton were exported. The number of cattle killed and refrigerated was 3,050,970 head. Flour milling ranks second to refrigeration, the average annual output being 7,000,000 sacks. Mining is of no great importance, although gold, silver, copper, and tungsten are worked to some extent. The 1927 production of crude petroleum amounted to 5,106,900 barrels, as compared with 3,773,585 barrels in 1925. Argentina ranks tenth among the oil-producing countries.

COMMERCE. On Jan. 23, 1928, the Director General of the National Bureau of Statistics furnished the following figures in his report on the foreign trade of Argentina to the Ministry of the Treasury: The cash value of the foreign trade of Argentina for 1927, excluding shipments of coin, amounted in round numbers to 1,864,790,000 gold pesos as against 1,614,675,000 gold pesos in 1926, showing an increase of 250,115,000 gold pesos, or 15.5 per cent, for 1927. Imports in 1927 amounted to 856,610,000 gold pesos, against 822,496,000 gold pesos in 1926, or an increase of 34,114,000 gold pesos, 4.1 per cent. Imports of coin amounted in 1927 to 86,550,000 gold pesos as against 2,035,000 in the previous year. Exports in 1927 amounted to 1,008,179,000 gold pesos as against 792,179,000 in 1926, showing an increase of 216,000,000 gold pesos, or 27.3 per cent. There were no exports of coin in 1927. The visible balance of trade in 1927 was favorable, amounting to 151,568,566 gold pesos, whereas in 1926 there was an unfavorable balance of 30,317,975 gold pesos.

FINANCE. The message of the President read to Congress during the summer stated that general revenues and expenditures during the fiscal year 1927 totaled 655,558,583 and 651,934,237 paper pesos, respectively—resulting in a surplus of 3,624,346 pesos. If the revenues to be collected on account of the sanitary works of the nation, and those from various Provinces for service on their debts, be considered, the surplus, according to the President, approximated 7,400,000 paper pesos. The President also stated that the executive power had refrained as much

as possible from making expenditures not authorized by Congress, limiting those by ministerial resolutions (*acuerdos de ministros*) to cases of "inescapable necessity." The amount expended by *acuerdos* totaled 16,705,171 paper pesos, and those by special laws of Congress, 18,280,853. It was further stated that the sum expended without authorization of Congress would have been kept at an insignificant amount as in 1923, if the Congress had sanctioned a budget providing for the expenditures that the increase of the administrative services demanded.

As a result of consolidation loans effected during the year, the unconsolidated debt was reduced to a total outstanding of 408,440,376 paper pesos on Dec. 31, 1927. In addition to this amount, the Government also recognizes a debt of approximately 40,000,000 paper pesos resulting from differences in exchange in connection with the cancellation of the loan obtained from the British Government in 1920. The payment of this amount was requested in a message to Congress of Aug. 31, 1923. The internal consolidated debt totaled 1,051,697,962 paper pesos on Dec. 31, 1927. During the year external flotations totaled 253,205,636 paper pesos and amortizations 37,809,250 pesos; so that the total consolidated debt at the end of 1927 amounted to 1,103,820,137 paper pesos. The total consolidated debt on Dec. 31, 1927, reached 2,155,518,099 paper pesos as compared with 1,845,847,778 at the end of 1926.

In 1928 the 1929 budget was passed as follows:

<i>Expenditures</i>	<i>Paper pesos</i>
Congress	6,383,511
Ministry of Interior	110,573,240
Ministry of Foreign Affairs	6,651,034
Ministry of Finance	27,602,138
Ministry of Justice and Public Instruction	147,797,756
Ministry of War	67,587,321
Ministry of Marine	46,816,045
Ministry of Agriculture	22,198,236
Ministry of Public Works	23,640,165
Pensions and allowances	28,220,992
Service of the public debt	216,661,016
Total	704,131,454

COMMUNICATIONS. The length of railways open on Jan. 1, 1928, was 22,791 miles, of which 4418 miles belonged to the State and 18,373 miles belonged to private companies. The total receipts in 1927 of both the State and privately owned lines were 146,840,800 gold pesos as against 137,942,400 gold pesos in 1926. Passenger traffic in 1926 was 145,000,000; freight traffic, 45,500,000 tons. The capital invested in 1925 amounted to 1,276,843,316 gold pesos.

GOVERNMENT. The executive power is vested in a president elected for six years, and the legislative power in a national congress, comprising a senate of 30 members elected for nine years, and a chamber of deputies of 158 members elected for four years by the people at the ratio of one deputy for every 49,000 inhabitants (census of 1914). One-third of the senate retires every three years and one-half of the chamber every two years. The cabinet is appointed by and under the direction of the President, and comprises the departments of foreign affairs, finance, interior, justice, and public instruction, war, agriculture, marine, and public works. President in 1928, Dr. Marcelo T. de Alvear (assumed office Oct. 12, 1922); vice president, Dr. Elpidio González. For the change in the presidency in 1928, see below under *History*.

HISTORY. Argentina went through all the throes

of a presidential election in the course of 1928. The successful candidate, Dr. Hipólito Irigoyen, was inaugurated on October 12, for the period 1928-34. He had been elected on April 1. Dr. Irigoyen was born in Buenos Aires in 1852 and educated at the college of San José, which later became the University of Buenos Aires. Evincing a keen interest in politics very early in life, it was not surprising to find him a member of the National Congress as early as 1880. For a number of years he devoted his time to teaching and managing his huge estate. During the political upheaval of 1890, Dr. Irigoyen, who was a distinct radical in politics, occupied an important position under the provisional government. He later refused to participate in the various governments of his country, but during the administration of Dr. Roque Saenz Peña (1910-14), he reached an agreement with Dr. Peña whereby the demands of the Radical party were met for the first time, and the electoral law was changed to provide for free, universal, and obligatory suffrage, including the secret ballot. The beneficent effects of the new law were immediately in evidence, a number of radicals were elected in 1912, and four years later the party as a whole was triumphant, Dr. Irigoyen being elected—in spite of repeated refusals to be a candidate—and assuming office Oct. 12, 1916. According to the Pan American Union *Bulletin*, "Among the outstanding achievements of his first administration were the unswerving neutrality of Argentina—in spite of enormous pressure from within and without—in the World War; the introduction of the minimum wage to save the working class from a devalorized currency and his determination that the purchasing power of the masses should not be reduced; the raising of the railway tariffs; and, above all, his policy of intervention in the upholding of national and provincial constitutions."

Of interest to the United States was the resignation of Dr. Honorio Pueyrredón from the post of Ambassador to the United States, an appointment he had held since 1924. He was considered in some quarters as openly hostile to the Washington conception of Pan-Americanism and played a leading rôle at the conference at Havana. See PAN AMERICAN UNION. Dr. Pueyrredón was succeeded by Dr. Manuel Malbrán who presented his credentials on September 17. Dr. Malbrán had been connected with the diplomatic service of the Argentine republic since 1909, serving, among other posts, as Minister to Colombia, Venezuela, Mexico, and Chile. Dr. Malbrán's task was not an easy one. The relations between the United States, as noted in the preceding YEAR BOOK, were anything but friendly. The immediate cause of the coolness was the tariff wall which the Fordney-McCumber tariff placed on Argentine products and the indifference which the American State Department and the Tariff Commission showed toward Argentine protests. A remote cause of the aloofness was undoubtedly the attitude which the South American Republic takes toward the Monroe Doctrine. It had stoutly maintained that this doctrine was a unilateral statement of an American president and in no way binds any other nation. Argentina sturdily maintained the complete and untrammelled sovereignty of all South American republics and refused to believe that her international actions were in any way impeded by the existence of the Monroe Doctrine. She held unswervingly to this course

at the Havana conference of Pan-American States in January-February, 1928, and stirred up a wave of anti-American feeling which the American representative, Charles Evans Hughes, was scarcely able to abate.

ARGOT. See PHILLOLOGY, MODERN.

ARIZONA. POPULATION. According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 334,162. The estimated population on July 1, 1928, was 474,000. The capital is Phoenix.

AGRICULTURE. The following table gives the acreage, production, and value of the principal crops in 1927 and 1928:

Crop	Year	Acreage	Prod. bu.	Value
Hay	1928	195,000	702,000 ^a	\$12,614,000
	1927	202,000	682,000 ^a	9,797,000
Wheat	1928	47,000	1,269,000	1,650,000
	1927	58,000	1,450,000	1,958,000
Barley	1928	17,000	646,000	517,000
	1927	20,000	700,000	525,000
Grain sorghums	1928	52,000	1,508,000	1,206,000
	1927	50,000	1,550,000	1,162,000
Cotton	1928	202,000	134,000 ^b	15,745,000
	1927	140,000	91,000 ^b	11,648,000
Corn	1928	89,000	1,014,000	1,268,000
	1927	44,000	1,408,000	1,619,000

^a tons, ^b bales.

MINERAL PRODUCTION. The total value of minerals produced in the State rose, for 1926, to \$115,047,987, from \$114,202,670 for 1925, and the State stood in 1926 thirteenth in rank as a mineral producer. As in preceding years, it derived its high total value of mineral production preponderatingly from the mining of copper, gold, silver, and lead. In the year 1927 production was somewhat reduced, principally in copper, in which during a great part of the year prices were depressed. Arizona's copper output in 1927 was 681,168,817 pounds; in 1926, 729,324,537. Gold production fell to 203,088 troy ounces in 1927, from 232,200 in 1926; in value, \$4,198,200 for 1927 and for 1926, \$4,800,000. Silver produced totaled 6,601,467 troy ounces in 1927 as against 7,506,708 in 1926; the decline in the respective silver totals by value, to \$3,743,032 for 1927, from \$4,690,236 for 1926, was pronounced. Lead production fell to 19,825,000 pounds (estimated) in 1927 from 23,258,274 in 1926; its value for 1927 was about \$1,342,200. Zinc production in 1927 was 1,984,000 pounds; in value, \$124,600. Arizona continued in 1927 to produce more than twice as much copper as any other single State. On a minor but increasing scale it produced lime, and chief among its other lesser products were stone and clay products.

For 1928 the total value of gold, silver, copper, lead, and zinc mined in the State was \$116,462,000. The increase in production value, over the total for 1927, was mainly in copper, and to a slight extent in silver, while decreases occurred in gold, lead, and zinc. Gold production in 1928 attained the total value of about \$3,930,000; silver output was about 6,943,000 ounces, in value, \$4,062,000; copper output, about 736,282,000 pounds, in value \$107,497,000; lead production, about 14,767,000 pounds, with a value of \$910,000; zinc recoveries were about 1,200,000 pounds, chiefly from Santa Cruz County, in value \$72,000.

FINANCE. State expenditure in the year ended June 30, 1927, as reported by the U. S. Department of Commerce, was: for maintenance and operation of government departments, \$5,931,979 (of which \$1,792,310 was for local education); or interest on debt, \$88,237; for permanent improvements, \$1,523,613; total, \$7,543,829 (of

which \$2,325,867 was for highways, \$1,040,819 being for maintenance and \$1,285,048 for construction). Revenue was \$7,710,146. Of this, property and special taxes formed 62.4 per cent; departmental earnings and charges for services of State officers, 4.6 per cent; sale of licenses and taxation of gasoline, 15.3. Property assessed valuation was \$656,252,610; State taxation thereon, \$4,459,913. Net funded State debt was \$433,267, which did not include a contingent debt represented by outstanding county and city debt contracted in the territorial period.

TRANSPORTATION. The total mileage of railroad line under operation on Jan. 1, 1928, was 2496.33. There were built in 1928, 39.64 additional miles of first track and 33.96 of second track.

EDUCATION. The State Board of Education adopted a requirement of three years' study beyond high school, in an accredited institution, as necessary to qualification for a teacher's certificate after July 1, 1930. The two State normal schools, at Tempe and Flagstaff, were placed on a four-year plan of instruction, instead of the two-year plan previously in operation.

CHARITIES AND CORRECTIONS. The central State authority in administrative welfare activities was in 1928 the Board of Directors of State Institutions, consisting of the Governor, the State Treasurer, and one appointed citizen member. This board reported the population of the State institutions at the end of 1928 as follows: Asylum for the Insane, 710; Industrial School, 115 (boys, 102; girls, 13); Pioneers' Home, 131 (including 12 women); State Prison, 549 (including 8 women). The board has charge also of a State free employment bureau. There were admitted to the State mental hospital in 1927, according to the U. S. Department of Commerce, 181 patients.

POLITICAL AND OTHER EVENTS. The State highway commission early in the year formulated plans for the building of some \$6,000,000 of highways, chiefly of oiled earth roads. This was opposed by delegates of the chief counties of the State, who demanded that the State lay hard-surfaced roads to link the concrete routes locally constructed. Construction work on the Coolidge Dam across the Gila River below San Carlos, under Federal auspices, advanced rapidly during the year, and at the year's end was nearly complete. The State attorney-general conducted an investigation into alleged price fixing in the sale of gasoline. With regard to the Boulder Dam project, the State Government maintained its opposition to the Johnson-Swing bill in Congress as depriving the State of the use of part of its natural resources. Governor Hunt in a communication to the Federal Trade Commission requested that it investigate the proceedings of lobbyists in favor of the bill.

Twenty giant land tortoises imported from the Galapagos Islands were placed in the care of the Boyce Thompson Arboretum near Superior, in order to ascertain whether this vanishing species could be acclimated in the arid parts of the State, and whether it would provide a resource of value. Cattlemen and the State University organized in the summer an effort to extirpate the burro weed, a poisonous plant, destructive to live stock, and said to be present in some eight million acres of the State territory. Conflict between sheep and cattle men over the use of grazing land in Mojave County led to suit for an injunction to restrain cattle men

from interfering with an association of sheep grazers. The State supreme court revised the boundary of Maricopa County so that it should include a desert strip of some 60 miles long and 6 miles broad, previously regarded as forming part of Pima County. The area in question included a great part of the Papago Indian reservation and certain mining properties. An unusual mining enterprise was undertaken between Flagstaff and Winslow, at the site regarded by geologists as the falling place of an ancient meteor. It was planned to sink a shaft to the bottom of the crater at a depth of 1000 feet with the purpose of extracting iron, nickel, platinum and iridium said to assay \$85 a ton.

ELECTION. Governor Hunt (Democrat) was defeated for reelection on November 6, by John C. Phillips, Republican candidate. Henry F. Ashurst, Democrat, was reelected to the United States Senate for the ensuing regular term. L. L. W. Douglas, Democrat, was reelected Representative-at-Large. Arizona gave a popular vote of 52,533 for Hoover and Curtis, on the National ticket; for Smith and Robinson, Democratic candidates, 38,537.

Beside the Governor, State officers elected in November, 1928, were: Secretary of State, J. C. Callaghan, (Democrat); Auditor, Ana Frohmiller (Democrat); Treasurer, C. R. Poice (Democrat); Attorney-General, K. B. Peterson (Democrat); Superintendent of Public Instruction, C. O. Case (Democrat).

OFFICERS. Governor, G. W. P. Hunt; Secretary of State, James H. Kerby; Treasurer, J. C. Callaghan; Auditor, Ana Frohmiller; Attorney-General, John W. Murphy; State Superintendent of Public Instruction, C. O. Case.

JUDICIARY. Supreme Court: Chief Justice, Henry D. Ross; Associate Justices Alfred C. Lockwood, A. G. McAllister.

ARIZONA, UNIVERSITY OF. A coeducational State institution of higher education at Tucson, Arizona; founded in 1885. The 1928 autumn enrollment totaled 1989, and the summer session of 1928 had a registration of over 300 students. The faculty in the autumn of 1928 numbered 172. The University receives Federal and State support. The endowment fund amounted to \$10,000 and the income for the year to \$1,127,333. The library contained approximately 70,000 volumes. President, Homer LeRoy Shantz, Ph.D., Sc.D.

ARKANSAS. POPULATION. According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 1,752,204. The estimated population on July 1, 1928, was 1,944,000. The capital is Little Rock.

Crop	Year	Acreage	Prod. bu.	Value
Corn	1928	2,002,000	33,033,000	\$30,080,000
	1927	1,925,000	36,575,000	31,820,000
Cotton	1928	3,610,000	1,215,000 ^a	110,565,000
	1927	3,048,000	1,000,000 ^a	101,000,000
Rice	1928	164,000	7,708,000	6,829,000
	1927	175,000	7,700,000	6,930,000
Hay	1928	756,000	794,000 ^b	10,934,000
	1927	789,000	876,000 ^b	11,709,000
Oats	1928	155,000	3,410,000	2,012,000
	1927	207,000	4,140,000	2,401,000
Potatoes	1928	36,000	2,700,000	2,160,000
	1927	29,000	1,972,000	2,958,000
Sweet potatoes	1928	28,000	2,520,000	2,268,000
	1927	38,000	4,408,000	3,526,000
Sorghum sirup	1928	40,000	2,800,000 ^c	2,520,000
	1927	44,000	3,520,000 ^c	2,992,000

^a bales, ^b tons, ^c gallons.

AGRICULTURE. The following table gives the acreage, production and value of the principal crops in 1927 and 1928:

MINERAL PRODUCTION. The rank of the State as a mineral producer, seventeenth in 1926, is due chiefly to its petroleum output and to natural gas. There were produced in 1927, 40,179,000 barrels of petroleum; in 1926, 53,332,000; in value, \$43,000,000 (estimated) for 1927 as against \$64,600,000 for 1926. The State ranked fifth in 1927 as a petroleum producer. Natural gas production was 43,566,000 M cubic feet in 1926, the year of latest available figures, and in 1925, 41,878,000; in value, it was \$5,817,000 for 1926, and for 1925, \$5,394,000. Gasoline was obtained from natural gas to the quantity of 36,300,000 gallons in 1927 as against 30,385,000 in 1926; and to the value of \$2,468,000 in 1927 and \$2,867,000 in 1926. Coal production declined to 1,548,834 net tons for 1927 from 1,459,017 for 1926; in value, it was \$5,393,000 for 1927 and for 1926, \$5,497,000. The production of bauxite, an aluminum ore, was less large than in some previous years, but continued to form the chief part of the domestic production. It was for 1927, 303,830 long tons; for 1926, 371,570 long tons; in value, \$1,892,860 for 1927 as against \$2,298,550 for 1926. The chief of the other products were stone, sand, and gravel. The total mineral production of the State for 1926 was \$84,485,672; for 1925, \$87,185,532.

FINANCE. State expenditures in the year ending June 30, 1927, as reported by the U. S. Department of Commerce, were: for maintenance and operation of governmental departments, \$13,192,622 (of which \$4,011,789 was for local education); for interest on debt, \$157,667; for permanent improvements, \$7,343,863; total, \$20,694,152 (of which \$9,060,701 was for highways, \$2,679,431 being for maintenance and \$6,381,720 for construction). Revenues were \$20,311,611. Property and special taxes supplied 39.3 per cent; sales of licenses and gasoline tax, 43.1 per cent; earnings of departments and remuneration for officials' services, 4.8 per cent. Property valuation was \$614,383,153; State taxation thereon, \$5,345,133. Net State funded debt, June 30, 1927, was \$3,017,087.

TRANSPORTATION. The total mileage of railroad line under operation on Jan. 1, 1928, was 4872.78. There was built in 1928, 0.66 mile of additional first track.

EDUCATION. The State department of education in concert with the State Education Association engaged in the year in an endeavor to give publicity to school needs, in anticipation of the legislative session of 1929. The movement to standardize elementary schools was stressed. Apportionment from the State school fund in 1926-27 was made to counties on the per capita basis, at the rate approximately of \$6 per capita. The income of the fund for this purpose was derived chiefly from a severance tax, a cigar and cigarette tax, and a 3-mill State tax. The school population in 1926 was estimated at 626,730. There were enrolled in the public schools in the academic year 1925-26, 382,172 white pupils, and 114,755 colored. In the elementary schools were 349,601 whites and 112,754 Negroes; in the high schools, 32,571 whites and 2181 Negroes.

CHARITIES AND CORRECTIONS. The State legislature in its session of 1928 passed an act to decentralize the control of the various State institutions for the care or custody of individuals.

This act abolished the State Board of Charities and Corrections, which had acted as the central State welfare authority under a statute of 1925. It placed the control of the State institutions severally in the hands of boards of honorary trustees. These trustees had power of appointment of superintendents, who in turn received the entire power of immediate conduct and management of the several institutions. The institutions thus affected were: State Hospital for Nervous Diseases, Little Rock, with which were grouped the State Hospital Dairy Farm; State Penitentiary, Little Rock; Confederate Home, at Sweet Home; Boys' Industrial School, near Pine Bluff; State Farm for Women, near Jacksonville; Arkansas State Training School for Girls, near Alexander; State Tuberculosis Sanatorium for Negroes; School for the Blind and School for the Deaf (under one board). Powers of parole recommendation were put in the hands of the boards of the reformatory institutions; a special parole officer was provided for the State Penitentiary Board. A State purchasing officer was created to contract for all purchases for institutions. The inmates of the penitentiary on Jan. 1, 1928, numbered 1088, of whom 368 were colored. From Jan. 1, 1927, to the end of 1928, 1198 prisoners were released on parole. Of 721 paroled in 1928, 512 made satisfactory reports under the law requiring them to obtain work with bonded employers within 6 months, and 82 were finally discharged; 81 failed to make required reports.

POLITICAL AND OTHER EVENTS. Arkansas sold in March an issue of \$13,000,000 of $4\frac{1}{4}$ per cent highway bonds to defray a part of its road building costs of preceding years. Labor troubles occurred in the coal mines of the State in April, where the operation of the Jacksonville wage scale came to an end on April 1, and the operators fell back on the lower wage scale of 1917. The 38th annual reunion of the United Confederate Veterans was held at Little Rock on July 8.

ELECTION. In the National election of November 6 Arkansas was one of the six Southern States that gave pluralities for the Democratic candidates, Smith and Robinson. To this result it was led largely by loyalty to Joseph T. Robinson, the vice-presidential candidate, a native and citizen of the State. The Democratic presidential plurality was much reduced from that of 1924; the popular vote for President in 1928 was: Smith (Democrat), 119,196; Hoover (Republican), 77,751. Harvey Parnell, Democrat, was elected governor, defeating M. D. Bowers, Republican. Seven Democrats were elected to the House of Representatives, of whom six were the incumbents.

A State act was offered by process of initiative, to forbid the teaching of the theory of evolution in schools or colleges deriving support from State contributions, and was passed by a majority of several thousand on the referendum vote. This act, derided by its opponents as the "Monkey Bill," was modeled on that of Tennessee, under which had occurred the Scopes prosecution at Dayton in 1925. The passage of the act by referendum was bitterly fought by Charles Smith of New York, President of the American Association for the Advancement of Atheism, who set up headquarters at Little Rock and conducted a campaign which led to his being imprisoned for expressions in contravention of a city ordinance prohibiting the use of the name of the Deity save "in veneration and worship."

Four amendments to the State constitution were ratified by popular vote on November 6. These were Amendments 15-18, inclusive. They provided, respectively, for increased salaries to State officers and members of the legislature, for verdicts in civil cases on the finding of 9 out of the 12 members of a jury, for authority to counties to build jails and lay a one-half-cent property tax to defray the cost, and for authority to Little Rock to vote a special tax to provide means for encouraging manufactories and river transportation facilities.

The following officers were elected in 1928 to serve from 1929: Governor, Harvey Parnell; Secretary of State, Jim B. Higgins; Treasurer, Ralph Koonce; Auditor, J. O. Humphries; Attorney-General, Hal L. Norwood; Superintendent of Public Instruction, J. P. Womack.

OFFICERS (1928): Governor, John E. Martineau (resigned); Lieutenant-Governor (succeeded as Governor), Harvey Parnell; Secretary of State, J. B. Higgins; State Treasurer, Ralph Koonce; Auditor, J. C. Cone; Attorney-General, H. W. Applegate; Commissioner of State Lands, Highways, and Improvements, Dwight H. Blackwood; Commissioner of Mines, Manufactures, and Agriculture, William N. Wilkes; Superintendent of Public Instruction, J. P. Womack.

JUDICIARY. Chief Justice, Jesse C. Hart; Associate Justices, Carroll D. Wood; Frank G. Smith; T. H. Humphreys; William F. Kirby; Thomas M. Mehaffy; E. L. McHaney.

ARKANSAS, UNIVERSITY OF. A coeducation-al State institution at Fayetteville, Arkansas; founded in 1871; comprising colleges of arts and sciences; education; engineering; agriculture (including experiment station); a graduate school; and schools of law, business administration, and medicine, the last named being at Little Rock. In the autumn of 1928 the enrollment was approximately 1900 and for the summer session of 1928 it was 850. The number of faculty members, including administrative officers, was 196 for the year 1928-29. The number of volumes in the library approximated 90,000; and the productive funds amounted to \$132,000, and the income for the year 1928-29 about \$1,200,000. Two new buildings for the college of engineering and college of agriculture, costing, with equipment, more than \$700,000, which were occupied by the respective colleges in 1927, are the first units to be added under a comprehensive building programme adopted by the legislature for execution within a five-year period. President, John Clinton Futrell, LL.D.

ARMAMENT, LIMITATION OF NAVAL. See NAVAL PROGRESS.

ARMENIA. A term applied since Apr. 2, 1921, to the new state known as the Socialist Soviet Republic of Armenia, or the Republic of Erivan. Before the World War, Armenia sometimes indicated the Armenian territories of the former Turkish Empire and sometimes the entire region in which the dominant race element was Armenian. In the former Turkish Empire the Armenians constituted about 38.9 per cent of the population in the following vilayets: Erzerum, Bitlis, Kharput, Diarbekr, Sivas, and Van; being in the minority in the first five and a majority in the last-named. The present number of Armenians in the Turkish Republic is unknown, a large part of the Armenian element having disappeared from Anatolia during the War and afterwards as a result of mas-

saecres, deportations, and migrations. The population of the former Turkish Empire known as Armenia and Kurdistan was given at 2,470,900.

SOCIALIST SOVIET REPUBLIC OF ARMENIA. On Apr. 2, 1921, Armenia was proclaimed a Soviet Republic. It comprises the southeast frontier region of Transcaucasia, which formerly belonged to the Russian Empire, but which in November, 1917, split off from Bolshevik Russia. The entire Transcaucasian region comprised the three main peoples, Armenians, Georgians, and Tartars, and was at first constituted into a federal republic, which lasted only a few weeks, however, due to the diversities of race and language. It dissolved into three parts, the Armenian Republic, Georgia, and Azerbaijan, each of which declared its independence. Although the Armenian Republic was recognized by the Allies in 1920, it soon fell under the sway of the Bolsheviks and was absorbed into their federation. The area is 11,680 square miles, and the population in 1926 was given at 867,671, 85 per cent of which was Armenian. The school attendance in 1925 was given at 81,000 pupils.

Agriculture, which is partly carried on with the aid of irrigation, is the chief industry of the people. Among the leading products are wheat, rice, licorice root, tobacco, and cotton. The area sown in 1925 was 255,900 dessiatines, which represents the pre-war area under cultivation. The cultivation of cotton, which fell away to almost nothing after the Bolshevik Revolution, is gradually assuming its place of importance in the agricultural activities, more than 15,000 dessiatines being devoted to its culture. The mining of copper is also a leading industry, 1500 persons being engaged in this pursuit. Having no seaports, the country is almost entirely cut off from the outside world, being compelled to depend for its communications on the single Transcaucasian Railway which passes through its territory from Batum to Baku. The capital, Eriwan, has a population of about 90,000.

ARMIES. See **MILITARY PROGRESS.**

ARMSTRONG, EDWARD. English historian and educator, died at Oxford, England, April 15. He was born at Grahamstown, South Africa, Mar. 3, 1846. He was educated at Exeter College, Oxford, becoming a fellow at Queen's College in 1869 and a tutor in 1870. After serving as assistant master of Rugby School, 1871-73, he returned to Oxford, and for many years was prominently identified with Queen's College. His researches into the history of the Renaissance in Italy gave him a virtual monopoly of teaching in that subject at Oxford. In 1926 he received the Serena Medal of the British Academy. He wrote much on history for periodicals, and also the following books: *Elizabeth Farnese* (1892); *The French Wars of Religion* (2d ed., 1904); *Lorenzo de Medici* (1897); *The Emperor Charles V* (2 vols., 1902).

ART EXHIBITIONS. Museums and collectors are beginning to realize more and more the advantages of unified exhibitions of schools of art or single artists, giving the public an opportunity to enjoy and compare works which cannot ordinarily be seen together. Both museums and private owners have shown a growing willingness to lend their treasures. The result has been such

a valuable series of exhibitions as the French Primitives in 1927, the German Primitives in 1928, and the Dutch Exhibition planned to be held in London in 1929. The exhibition of German Primitives was certainly the most notable event of 1928. There were also other important loan exhibitions during the past year. Two at the Metropolitan Museum in New York were particularly interesting. The showings of French Gothic tapestries and of Spanish art. The Detroit Institute of Arts also held two noteworthy loan exhibitions, one of Titian and the other of Gothic art of the thirteenth, fourteenth, and fifteenth centuries. An exhibition of Flemish primitives from the Sigmaringen collection was one of the important art events. The Hartford Museum had on view a loaned group and the Albright Gallery in Buffalo a series of impressionist exhibitions.

A number of interesting exhibitions were held in galleries in New York. The showing of the Chester Dale collection of modern French painting was perhaps the most important of these. The exhibition of Odilon Redon was excellent, the most important group of works by this artist ever shown in America. The group of Cezanne shown was the first complete exhibition in New York. There was also a single presentation of Degas, showing the entire range of his art. *A Century of French Painting* was perhaps the best of the group exhibitions.

A number of memorial exhibitions were held in various countries. The four-hundredth anniversary of Dürer's death was celebrated very thoroughly in Germany, most thoroughly, of course, in Nuremberg. Exhibitions were also held in London and in America at the Boston Museum. The memorial to Goya in Madrid was finished and a celebration took place in honor of the artist's centenary. Exhibitions of Goya's work were also held in London at the Burlington Fine Arts Club and in New York at the Metropolitan Museum. The five-hundredth anniversary of the death of Gentile da Fabriano was celebrated modestly but loyally in Fabriano, while a more solemn commemoration was given to Veronese in Venice. France took little advantage of an opportunity to honor Houdon, the greatest of the eighteenth century sculptors. Of the memorial exhibitions of Gilbert Stuart in America, the one at the Boston Museum was the best.

During the year there was a good deal of effort on the part of European countries to give America an opportunity to see more of their work. Such an exhibition as that of the London Artists' Association was designed with this intention. The same sort of thing was done even more in the decorative arts. A number of showings were arranged on steamships, principally by England, France, and the Scandinavian countries. Other groups of foreign work shown were in the Russian Exposition of Education and the Scandinavian-American exhibition.

The usual exhibitions of the summer art colonies were held at Lyme, Stockbridge, Newport, and Gloucester. Among the societies exhibiting during the year were: The Boston Society of Independents, the New York Water-Color Club, the National Association of Woman-Painters and Sculptors, the Associated Dealers in American Painting, the New Society of Artists, the Society of Independent Artists, the Salons of America, and the Whitney Studio Club.

Other exhibitions of interest in New York were the memorial exhibition of the work of Edwin Austin Abbey, of which there had never been a public view in the United States, one of the most important single exhibitions of the year, and the International Exhibition of Ceramic Art at the Metropolitan Museum, in which it was noted that the American work was among the best.

CARNEGIE INSTITUTE, PITTSBURGH. The twenty-seventh International Exhibition of Paintings was arranged on the general plan adopted in the previous year of inviting fewer artists and hanging more pictures by each artist. There were in all 381 pictures, 253 by the 62 European artists and 128 by 54 American artists. The institute for several years had been feeling its way to a more liberal art and for two years at least the choice of prizes had been much affected by the persistent protests of the independent artists and critics. The first prize, acknowledging the ascendance of the French moderns, went to André Derain for his painting, *Still Life*, a conception typical of his post-war period. The second prize was won by Pedro Pruna, a Spaniard who was associated with Pablo Picasso in Paris, and was one of the youngest artists to receive an Carnegie award. His painting was also a still life. The third prize was won by Glenn O. Coleman, an American. First honorable mention went to Mrs. Ernest Proctor, wife of the English artist, who painted under the name of Dod Proctor and had exhibited at the institute before. Other honorable mentions were: Marie Laurencin of Paris, Georgina Klitgaard, the American wife of a Danish writer, and Albert Saverys of Belgium. The prize for flower-painting offered by the Garden Club of Allegheny County was awarded to Henri Labasque. The jury was composed of Anto Carte of Belgium, Colin Gill of England, Rockwell Kent and Ernest Lawson of the United States, and was presided over by Homer Saint-Gaudens, Director of Fine Arts.

CORCORAN ART GALLERY. The eleventh exhibition of contemporary paintings was held in 1928 and aroused a good deal of interest because of its awards. The Corcoran had been slower than most galleries in recognizing the more recent painters and had been dominated until 1928 by the acknowledged academicians. The prize-winners were even more surprising than those of the Carnegie Institute. The picture, *Summer*, by Barnard Karfiol, which won the first William A. Clark Prize of \$2000 and the Corcoran Gold Medal, would probably not have been accepted for exhibition several years previously. The second William A. Clark Prize of \$1500 and the Corcoran Silver Medal went to Eugene Speicher for *Girl in White Dress*. The third Clark Prize of \$1000 and the Corcoran Bronze Medal were awarded to Frederick Carl Friesecke, and the fourth Clark Prize and the Corcoran certificate of honorable mention, to Henry Lee McFee.

PENNSYLVANIA ACADEMY. The one-hundred-and-twenty-third annual exhibition of the Academy of Fine Arts was not very different from other exhibitions of recent years. The general tone was conservative, and there were even fewer modernistic pictures than usual. The prizes were awarded as follows: Temple Gold Medal for the best picture in oil by an American painter to James Chapin for *George Marvin and his Daughter Edith*; the Jennie Sessan Gold Medal for the best landscape to Kenneth Bates, for *Day's End*,

Year's End; the Carol H. Beck Gold Medal for the best portrait by an American artist to William Paton for his portrait of Mrs. Francis R. Strawbridge; the George D. Widener Memorial Gold Medal for the most meritorious work by an American sculptor to Albert Stewart for *Polar Bear*; and the James E. McClees Gold Medal for the best group in sculpture by an American to Albert Laessle for *Duck and Turtle Fountain*; the Walter Lippincott Prize for the best figure-piece in oil by an American to Feodore Zakharov for *Reverie*; and the Mary Smith Prize for the best painting by a Philadelphia woman to Laura D. S. Ladd for *Still Life and Dahlias*.

NATIONAL ACADEMY SPRING. The one-hundred-and-third annual exhibition of the National Academy of Design was unusual in its liberal spirit toward the younger artists and outsiders. There was a good deal of encouragement for the newcomers and the greater part of the exhibit represented young and unknown artists. The first Altman Prize was won by Ernest Lawson for *Hills in Winter*. A. T. Hibbard's *Snow Mantle*, a picture that attracted immediate attention, won the Second Altman Prize. Alice Kent Stoddard received the Thomas B. Clarke Prize for her figure study of *Polly*. The first Hallgarten Prize went to Carl Lawless for *In the Mountains*, a winter scene of very good design and atmosphere. The Isaac Maynard Prize was awarded to Jean McLane for a very agreeable characterization of a young girl. The Saltus Medal for Merit was won by Laura Gardin Fraser's admirable likeness of Mrs. E. H. Harriman. The third Hallgarten Prize was given to George Byron Browne, a young student. J. E. Costigan's *Springtime* won the Speyer Memorial prize.

NATIONAL ACADEMY, WINTER. This exhibition, even more than the one in the spring, gave to the independent artists a chance to compete with the academicians on their own ground. Of the 462 works shown, there were 328 by outsiders. And the academy made good this encouragement since the prizes were awarded to comparatively unknown artists. J. M. Schwaikyer received the first Altman Prize for his *South Dakota Evening*, a picture of Western farm life. The second Altman Prize went to E. Kent Wetherill for *East Side*. The Carnegie Prize was given to John Noble for *The Big Herd*. Anna Hyatt Huntington's *Fighting Bulls*, an animated group in bronze, received the Julia A. Shaw Memorial Prize. The Thomas R. Proctor Prize for the best portrait went to Marie Danforth Page for her pleasant painting, *Sisters*. Gertrude K. Lathrop won the Helen Foster Bennett Prize with her amusing bronze donkey, *Sammy Houston*. The Elisabeth N. Watrous Gold Medal for sculpture was awarded to Attilio Piccirilli for *Una Virgine*, a figure in marble. The Francis Murphy Prize for landscape was won by Carl Wuermer for *Winter Day*. The Isidor Medal for figure composition went to Robert Spencer, for *The Exodus*.

ART INSTITUTE, CHICAGO. The forty-first annual exhibition of American Paintings and Sculpture was held as usual, with no striking differences from other years, except that the institute, like others, had opened its doors to an increasing number of young Americans. The prizes were awarded as follows: The Logan Gold Medal and Prize of \$2500 to J. Theodore Johnson for *Black Mantilla*, a rather usual portrait type; the Logan Silver Medal with \$1500 to Arthur B. Carles for

Arrangement, in which color and design are well harmonized: the Potter Palmer Gold Medal with \$1000 to Max Weber for *Still Life*; the Logan Medal with \$750 to Maurice Sterne for *Afternoon*, a distinctly modern work; the Norman Wait Harris Silver Medal with \$500 to Karl Knaths for *Barnyard*, also decidedly modern in type; the Norman Wait Harris Bronze Medal with \$300 to Adolph Borie for *Portrait of Iris Tree*; M. V. Kohnstamm Prize of \$250 to William S. Schwartz for *Talmudists*; the Peabody Prize of \$200 to Karl Oberteuffer for *Still Life*; the Martin B. Cahn Prize of \$100 to Robert Lee Eskridge for another modern work, *Stone Fishing*; the William R. French Memorial Gold Medal to John C. Johansen for *The Artist's Family*. The honorable mentions were: in landscape, Jean Crawford Adams' *Landscape No. 2*; architectural subject, Rudolph Weisenborn's *Chicago*; sculpture, Gaston Lachaise's *John Marin*; portrait or figure-piece, Umberto Romano's *Suzanna and the Elders*.

EUROPEAN EXHIBITIONS. The most noteworthy exhibition in Europe was that organized in London at Olympia by the British antique dealers. This exhibition was, on a large scale and a great number of important works of art were shown there. Other interesting European showings were: In London, a loan exhibition of Gainsborough, sculpture by Maillol, and cloud sketches by Constable, and a notable presentation of Mr. Talbot Hughes's collection of miniatures in oil by old masters, which has since been acquired entire by Dr. Rosenbach; an exhibition in Paris of Francois Xavier Winterhalter, which marks that artist's return to favor; also in Paris an exhibition of Largilliere; in Berlin exhibitions of Manet, of Van Gagh, and of Gothic tapestries; in Venice the sixteenth Biennial Exhibition of International Art in which ten nations took part; in Basel an exhibition of Gauguin; and in Seville an exhibition of ceramic art.

ARTINGSTALL, art'ing'stäl, SAMUEL GEORGE. American civil engineer, died August 7, at Chicago, Ill. Born in Manchester, England, Nov. 25, 1845, he came to this country with Chicago's first city engineer, E. S. Chesbrough, who had been studying the English drainage systems. Artingstall took charge of the design and management of the new water supply which derived its water from Lake Michigan. He also introduced the first intercepting sewer system, and made the first plans for the straightening of the Chicago River at Goose Island. The Sanitary District of Chicago was his proposal, and it was he who appointed the commission, upon which he worked, as an ex-officio member, to investigate the sewer situation. Artingstall designed the Twelfth Street viaduct, and carried out the plans for the first mechanical swing bridge at Rush Street. He served as city engineer until his death, having relinquished the position for a time to become chief engineer of the Chicago World's Fair of 1893. Besides his civic work, Artingstall maintained an active private practice. His extensive work outside of Chicago included the designs for the water system of Santiago, Cuba, and consultation over proposed harbor improvements in Chile. Artingstall, one of the founders of the Western Society of Engineers, was at one time its president. He also belonged to the American Society

of Civil Engineers, and to the Institution of Civil Engineers.

ART INSTITUTE, CHICAGO. See ART EXHIBITS; ART MUSEUMS.

ART MUSEUMS. The general tendency to the museums in recent years has been to give more attention to the decorative arts, not only for their own value but as a background for the painting and sculpture of various periods. This has, of course, been done in the American Wing of the Metropolitan Museum in New York. The opening of the Pennsylvania Museum at Philadelphia in the spring of 1923 presented a new and very important example of the same plan of arrangement, and was in this and other respects the most notable action of the year on the part of a museum of fine arts. The building itself is an impressive addition to the museums of the country. It is classic in design and is unusual in its use of color. Only a few of the galleries were complete for the inaugural exhibition. These occupied the principal floor of the north wing and comprised ten period rooms devoted to the English and American sections and nine galleries of European schools. The emphasis of this exhibition was on American and English work, as several of the collections of paintings recently acquired by the museum are of the American and English schools.

The Thomas B. Clarke collection of early American painting was exhibited in its entirety for the first time. Other collections on exhibition were those bequeathed to the city by William L. Elkins, George W. Elkins, William P. Willstach, and John Howard McFadden. Many valuable works of art were loaned to the museum for this exhibition, including part of the Johnson collection.

The Metropolitan Museum of Art announced the usual large number of acquisitions. A fourteenth-century Spanish tomb of one of the Counts of Urgel was installed at the Cloisters, the gift of John D. Rockefeller, Jr., Corot's *Woman Reading*, was presented by Mrs. Louise Senff Cameron. Other acquisitions were: a portrait of Moretto da Brescia, a German thirteenth-century sculpture in wood, a French fourteenth-century marble Madonna, five folio volumes of engravings after Watteau from the Six collection, *The Ford* by Claude Lorraine, and some notable additions to the Chinese and Egyptian collections.

The Boston Museum of Fine Arts opened a new wing of decorative arts, the most important event of the autumn season and comparable to the opening of the Pennsylvania Museum. The classical department of the museum acquired a collection of Greek gems assembled by Edward Perry, a number of which were formerly in the famous Lewes collection. The museum also added to its collections a rare cloisonné enamel of the eleventh century representing St. Nicholas, a product of the best period of Byzantine cloisonné. Other acquisitions were: A portrait of Alessandro Farnese by Tintoretto, prints from the Saxony collection, important examples of fifteenth- and sixteenth-century sculpture, early Spanish frescoes, four paintings of the Sung dynasty, added by Dr. Denman Ross to his collection, and a group of drawings by nineteenth-century artists.

The Detroit Institute of Arts acquired paintings by Vrell and de Hoogh; a portrait head by Ingres, two small panels by Crivelli, a Constable, an early American landscape by John F. Ken-

sett, a Chinese fresco of the T'ang dynasty, and additions to its collection of colonial furniture. Other traditions were: four pictures by Derain, works by Lancret, Robert, Fragonard, eighteenth-century French furniture, and the *Bourbon Madonna* by Bellini.

The Charles W. Harkness bequest to the Cleveland Museum of Art was completed, two of the eleven paintings having been received several years previously. Other acquisitions were: *The Race Track*, by Ryder, a sculptured head of Alexander, a portrait by Veronese, a French primitive, and an ivory plenary cover.

The Minneapolis Institute of Arts installed a new sixteenth-century room and received as gifts over five thousand prints and a picture of John the Baptist by Guido Reni.

The Carnegie Institute at Pittsburgh bought the *Still Life* by Derain which won the first prize at the International exhibition. The institute also acquired examples by Duveneck, Rockwell Kent, Ambrose McAvoy, and Charles W. Hawthorne.

The Brooklyn Museum received as a gift from Adolph Lewisohn a Madonna by Joseph Stella and sculptures by Epstein and Kai Neilsen. It also acquired a landscape by Hobbema and the Perry collection of costumes of the period 1885-1910.

The San Diego Museum purchased a Degas from the fund of its founder, Edward D. Libbey. Other acquisitions were: A portrait by Cranach, paintings by Romney and Bol, a print by Rembrandt, and a sixteenth-century tapestry representing a Calydonian boar hunt.

There were several additions to the Harrison gallery of modern French painting in Los Angeles: *Femme en Bleu*, by Degas, *Theatre d'Atelier à Montmartre*, by Utrillo, and paintings by Forain and L'hoté.

The Worcester Museum acquired an important Madonna by Raphael, from the collection of the Earl of Northbrook. The Albright Art Gallery in Buffalo bought a Degas. The Art Institute in Chicago, *La Table au Moulin Rouge*, by Toulouse-Lautrec. The Wadsworth Atheneum and Morgan Memorial in Hartford bought Tintoretto's *Hercules and Antæus* and a water-color by Daumier. The Rhode Island School of Design added to its collections an ivory dyptych and a Græco-Roman head of a goddess from the first century B.C. The acquisitions of the Denver Museum were a still life by Beuchelaer and some majolica tiles. The Indianapolis Museum acquired a portrait of Ignatz von Dollinger, by Lenbach, and the Cincinnati Museum *Bébé en Costume Blue*, by Mary Cassatt. The Rochester Museum acquired two rare Gothic tapestries and a French Gothic Madonna.

The Corcoran Gallery in Washington completed a new addition to the original gallery, built especially to receive the paintings of the W. A. Clark collection. The Yale University Gallery opened a new section and acquired the Samuel Wells Williams collection of Chinese porcelains, lacquers, glass, bronze, and woodwork. The William M. Clements Library of American History of the University of Michigan received Benjamin West's painting, *The Death of Wolfe*.

EUROPEAN MUSEUMS. The acquisitions of the British Museum include Japanese prints and illustrations by William Blake for Young's *Night Thoughts*, the latter presented by Mrs. Frances White Emerson of the United States. Sir Joseph Duveen recently made a gift to the na-

tion to enlarge the National Gallery. The National Gallery opened a new room to contain the forty-two pictures in the bequest of Dr. Ludwig Mond. The Commission of Fine Arts of the city of Paris accepted the gift of the Ernest Cognacq collections which were to be housed in a special building near the Opéra in accordance with the wishes of the donor. The Louvre acquired the famous "Laborde head," a fragment from the occidental frieze of the Parthenon, and Manet's portrait of Mallarmé. The Rijksmuseum recently added *The Sick Child*, by Metsu, from the Huldinsky collection; a painting by Pieter de Hoogh, and a study for Rembrandt's *Lesson in Anatomy*, from the Six collection, and a portrait of Alessandro de' Medici, by Pontormo. The Kröller collection of Van Gogh is to be kept in Holland. The Kunsthistorisches Museum in Vienna has acquired a *St. Jerome*, by Lucas Cranach. There is to be a national gallery in Poland and a new Marco Polo Museum in Venice.

ART SALES. By far the most important event of the 1928 auction season, or of any auction season, in America, was the sale of the collection of the late Judge Elbert H. Gary. The total of the four sessions, \$2,297,763, was the highest ever realized for the sale of a single collection, breaking the record formerly held by the Yerkes collection in 1910 which brought \$2,207,866. The first session was given over to the thirty-nine paintings in the collection. With the exception of Rembrandt's *Warrior Putting On Armour*, Hals's *Young Cavalier*, and a self-portrait by Fragonard, the highest prices went for the eighteenth-century English school, of which the collection contained notable examples. *The Harvest Wagon*, by Gainsborough, was bid in by Sir Joseph Duveen for \$360,000, the highest figure in the sale. Hoppner's portrait of Lady Dashwood-King brought \$90,000, going higher than the Rembrandt. Furniture, porcelain, rugs, etc. were sold in the remaining sessions. Houdon's bust of his daughter Sobine brought \$245,000, and a royal Ispahan palace carpet \$106,000.

The sale next in importance was that of the Salomon collection, formerly the property of the late William Salomon of New York, which in four sessions reached a total of \$675,531. The finest pieces were reserved for the last session, which brought \$498,160. This was one of the largest sales of French furniture and art of the eighteenth century ever held in America. Besides furniture, the collection contained paintings, sculpture, tapestries, clocks, and other *objets d'art*. A marble bust of Madame de Wailly, by Augustin Pajou, went to a dealer for \$28,000. A portrait of the Chevalier de Bellant, by Jean Honoré Fragonard, brought \$24,000. Mrs. Elisha Walker paid \$44,000 for seven pieces of carved and tapestry-covered Louis XVI furniture and \$17,000 each for two sculptured marble groups by Pajou.

The third large auction of the year was that of the collection of the late Charles H. Senff, which reached a total of \$580,375. The Dutch School predominated in the first session. The highest prices were paid for Hals's *Portrait of a Lady*, \$55,000, Velasquez's *Portrait of General Marchese Spinola*, \$53,000, the original price of which was only \$6000, and Hals's *Portrait of a Dutch Burgher*, \$47,500. The second session was concerned principally with the Barbizon school, which, with the exception of Corot, went for distinctly less than the collector paid for them. The

event of this session was the sale for \$31,000 of Corot's *Woman Reading* and is significant in showing the increasing value of Corot's figure pieces. This picture was bought by Louise Senff Cameron and later was presented to the Metropolitan Museum of Art. Dupré, Daubigny, Rousseau, and Diaz were sold at a loss.

Other sales of interest were the George S. Palmer collection of colonial and English furniture, paintings, etc. which realized \$198,406.50, and the sale of duplicates in the collection of sculpture of the Metropolitan Museum of Art. The importance of the latter is that it was the first time such a sale had been held.

The London season opened brilliantly with the sale at Christie's of the remaining pictures in the Holford collection, principally Dutch, with some German, French, and English, a remarkable group of pictures. The high figures obtained in this sale, even higher than had been expected, were evidence of the growing popularity of the Dutch school. One of the most significant items was a portrait of a young man by Petrus Christus, which brought \$75,117. The astonishing price of \$67,068 was paid for Susterman's portrait of Gian Carlo de' Medici. It was, of course, no surprise that Rembrandt should have commanded the largest price, but of the two pictures, *Portrait of a Man Holding the Torch*, \$257,544, and *Portrait of a Young Man with a Cleft Chin*, \$236,082, it had been expected that the latter would go higher, since it was supposed to represent Rembrandt's own son. The total of the two days was \$2,032,575, the amount received the first day, \$1,776,000, being the largest amount ever realized in a single sitting.

The extensive collections of Sir Hercules Read were dispersed at auction at Sotheby's in November. This collection, containing especially Oriental porcelains and bronzes and Græco-Roman and Egyptian antiquities, made one of the most varied and interesting sales of the season.

During the autumn of 1928 the collector's centre of interest was Amsterdam, where several important auctions were held. The first of the collections sold, the Six collection, derives its fame from the connection of its founder, Burgomaster Jan Six, with Rembrandt, and it was probable that the part of the collection formed by Jan Six himself was selected with Rembrandt's advice. The larger portion, however, had been added by later members of the Six family, and, as many of the greatest treasures had been disposed of from time to time, some going to the Rijksmuseum, and as others, including Rembrandt's portrait of Jan Six, were being retained by the family, the group offered for sale was far from being the complete collection or even its most valuable part. The sixty-four paintings and etchings in the sale brought a total of \$925,012. The highest price, \$144,000, was paid for *The Village in the Wood*, by Hobema, which, together with *Dutch Interior*, by Pieter der Hooch, \$61,000, were to be brought to America. Rembrandt's etching of Jan Six brought \$39,600, the highest price ever paid for an etching. *The Woman Eating Oysters*, by Jan Steen, was sold for \$83,600, and *The Letter*, by Terborch, for \$127,600; *Juno*, or *The Listening Girl*, by Nicholas Maes, brought \$22,000, and the *Church of St. Marie, Utrecht*, by Pieter Jansz Saenredam, about \$27,000.

The sale of part of the collection of Baron von Nemes in Amsterdam late in the autumn brought

lower prices than had been expected, in contrast to the inflated prices of the Six sale. This collection was particularly noted for its El Grecos; it contained also works of the Italian, Flemish, and German schools. Among the important pictures were: *The Immaculate Conception*, by El-Greco, which brought £14,580, the highest price in the sale; *Don Francesco de Savedra*, by Gova, £6,250; *Susanna at the Bath*, by Tintoretto, £6583; *The Adoration of the Magi*, attributed to Jacopo del Sellaio, £4583; and *The Judgment of Paris*, by Lucas Cranach, £4333.

Early in the summer the well-known collection of L. de Spiridan of Rome was sold in Amsterdam. The important feature of this sale was the painting of *Leda and the Swan*, which has been accepted as an authentic work by Leonardo da Vinci. It sold for about 221,000 florins. A small wooden panel by Fra Angelico, in an excellent state of preservation was also an interesting item of the sale. It brought 37,000 florins. The same amount was paid for a fine example of Carlo Crivelli, a *Madonna and Child* ornamented with glass jewels.

Collectors turned again to Germany as a centre of art for the first time since the War. The sale of the Huldinsky collection, one of the finest in Germany, brought many connoisseurs to Berlin. The gathering of this remarkable group of pictures owed much to the advice of Dr. Wilhelm von Bode of the Kaiser Friedrich Museum, and showed evidence of the personal enthusiasm of the collector himself. The total of this sale was something more than 5,000,000 marks. The largest price, 570,000 marks, was paid for Rembrandt's portrait of Hendrickje Stoffels, *The Portrait of the Painter Franz Post*, by Hals, brought 305,000 marks. *The Letter*, by Terborch, was sold to a Dutch collector for 165,000 marks and subsequently was resold at the Six sale for considerably more. A small portrait by Holbein brought 155,000 marks and a panel by Botticelli, *The Annunciation*, was acquired for 210,000 marks.

Another auction of considerable interest was held in Berlin. A collection of art treasures, principally from palaces and museums in Leninograd, were sold by order of the Soviet authorities. The paintings and furniture offered for sale, mostly eighteenth-century French art, brought a total of 3,000,000 marks.

In Leipzig the sale, in the beginning of the summer, of prints at Boerner's was an event of the year. Early Italian engravings and engravings by Rembrandt were the feature of the sale. Two rare copies of Rembrandt's *Presentation in the Temple* brought respectively 43,000 and 35,000 marks. The total of the sale was 1,000,000 marks. Another sale of Dutch, Flemish, and German prints was held at Boerner's in November.

An important sale of modern French paintings and drawings was held in Paris. Dr. Soubies's collection, including an unusual group by Matisse, Cézanne, and Derain, brought a total of 3,142,000 francs. The highest price, 360,000 francs, going for Cézanne's *Jeune Homme au Petit Chapeau*. Among other notable events in France was the sale by the artist's family of the collection of Camille Pissarro. Many of Pissarro's most important paintings had since his death remained in the possession of the family. In this sale fifty-nine were offered for sale as well as thirty-three pictures by Monet, Seurat, Guilumin, Mary Cassatt, and others. Other points of

interest in the Paris season were the sales of the art collection of late Count Robert de Montesquiou-Fézensac and of prints, etchings, lithographs, and water-colors from the collection of Lods Delteil. The latter sale, a few months after the death of M. Delteil, attracted numerous connoisseurs to Paris. M. Delteil, an authority in his field, specialized in prints of the nineteenth century. Several rare Meryons were sold, as well as prints by Delacroix, Degas, Daumier, Monet, and others.

ASPHALT. The statistics of this industry for the year 1927 reflect the demands for good roads by the population of the United States and continued building activity. Asphalt is used chiefly in paving, and though it met keen competition from concrete and coal tars, its consumption increased during 1927. The sales of natural asphalt and related bitumens at mines in the United States amounted to 839,040 short tons, valued at \$5,605,850, which represented a material gain over 1926, due chiefly to developments in Texas in sales of bituminous rock, the chief product of this group. Sales of asphalt and asphaltic materials manufactured from petroleum amounted to 3,951,450 short tons, an increase of 14 per cent over the 1926 production. Of the 1927 total sales, 1,525,420 tons, valued at \$19,019,150, were produced from domestic crude petroleum, and 2,426,030 tons, valued at \$35,771,940, from foreign petroleum. Of the manufactured asphalt, the paving variety comprised 42 per cent of the total output, while the roofing and waterproofing branch of the industry used more than 1,000,000 tons of petroleum asphalt in 1927, which represented a larger increase over the previous year than was shown by paving asphalts. Imports of native asphalt and bituminous rock into the United States during 1927 amounted to 158,097 short tons, an increase of 15,465 tons over 1926, or an 11 per cent gain. Trinidad (including Tobago) and Venezuela furnished 96 per cent of the total imports. Imports of petroleum asphalt amounted to 385,031 short tons, a gain of 163 per cent over 1926, which reflects the rapid increase in the use of petroleum asphalt throughout the world. Exports of petroleum asphalt amounted to 385,031 tons in 1927, and were valued at \$3,325,413, as compared with 146,589 tons and a valuation of \$3,183,746 in 1926.

ASQUITH, HERBERT HENRY, FIRST EARL OF OXFORD AND ASQUITH. English statesman, died at Sutton Courtenay, Berkshire, England, February 15. He was born at Morley, Yorkshire, Sept. 12, 1852, and was educated at the City of London School, where he won a Balliol, Oxford, scholarship. After being graduated from Balliol with a first class in letters, he read law, and was called to the bar at Lincoln's Inn in 1876. His career as a barrister was notably successful, and he was connected with famous cases. He won widespread public recognition by his cross-examination of Mr. Macdonald, manager of the *London Times*, in the famous case of Parnell against the *Times* over the Piggott forgeries. He defended John Burns for his participation in the so-called labor riot in Trafalgar Square, London, in 1887, losing the case but enhancing his reputation. In

1889 Asquith took a prominent part as counsel for the Irish Nationalists before the Parnell Commission. He entered Parliament as a Home Ruler in 1886, winning the notice and the favor of Gladstone, who made him the home secretary in 1892. In that office he aroused opposition from labor by his stern measures against disorder, but his course was generally commended by the public. Although never eminent as an orator, he was an effective debater at this and subsequent stages of his long political career. In 1895, when the Liberals were defeated, he went out of office with the rest of the cabinet. During the period of Conservative rule, 1895-1905, Asquith, while retaining his membership in the House of Commons, devoted himself mainly to the practice of his profession, with much success. His reputation as a politician also increased steadily, and he was noted especially as an opponent of the policy of protection. In 1905, when Sir Henry Campbell-Bannerman, Liberal, became Premier, Asquith was the most prominent member of the cabinet, as chancellor of the exchequer, and, owing to the feeble health of his chief, was virtually the prime minister. Campbell-Bannerman died in 1908, and Asquith became head of the Government.

He was prime minister for eight years, holding the office for a longer time than any other man in modern days save Lord Liverpool. His incumbency of the office was one of the stormiest periods in English history, embracing as it did in its early years the contests over the Lloyd George labor policies, the abolition of the veto power of the House of Lords (forced through in order to bring to a successful conclusion the battle for Irish home rule), the woman-suffrage question, and the "revolt" in Ireland, and, in its later period, the first years of the World War. In May, 1915, came the reorganization of the cabinet to admit the leaders of the opposition, and Asquith yielded the premiership to Lloyd George. From that time until the election of December, 1918, Asquith was virtually in opposition, while advocating vigorous prosecution of the War. The Armistice came in November, 1918, and in the December election of that year Asquith lost the seat in Parliament, for East Fifehire, which he had held for thirty-two years. In 1920 he was returned as a member for Paisley. From that time until 1926 he and Lloyd George were nominally rivals for the leadership of the Liberal party. In 1925 Asquith left the House of Commons for the House of Lords, as first Earl of Oxford and Asquith, and in the following year resigned as party leader, owing to his poor health. His *Memories and Reflections*, containing interesting comments on his contemporaries and reflections on his experiences, was published in 1928, several months after his death.

His second wife, known popularly as "Margot" Asquith, astonished the world in 1922 by her autobiography, in which she made frank revelations concerning prominent men and women alive and dead. Later she published other books which also attracted much attention.

ASTRONOMY. Coördinate in interest and importance with the recent work on the internal structure of stars, are the investigations of Milne and others on the theory of stellar atmospheres and of the production of spectrum lines therein. It has been shown that in the reversing layer of a star, radiation pressure commences to be increasingly effective in support-

ing atoms against gravity, and in the chromosphere the atoms are supported almost entirely by such pressure. The pressure in question, however, is that arising from the *selective* absorption that produces the dark lines in stellar spectra; in contradistinction to the *general* radiation pressure so important in the interior of a gaseous star, this selective radiation pressure begins to be important only near the outside: The pressure exerted by radiation of any particular wave-length is proportional jointly to the net outward flux of radiation of that wave-length and to the degree of obstruction offered by the absorption coefficient; at a point in the stellar interior, the inward and the outward streams of radiation of a wave-length close to one of strong selective absorption are very nearly equal, since each (being unable to penetrate far) must have originated close by; but near the boundary there is little inward flux, the atoms are exposed to the full brunt of the outward stream alone, and the intense selective opacity gives rise to a large unbalanced radiation pressure which pushes the atoms outward. Internal mechanical equilibrium under a steep pressure gradient and general radiation pressure thus shades off into equilibrium under a small pressure gradient and strong selective radiation pressure. On this theory, as Pike has shown, most of the observed motions of the chromospheric gases can be satisfactorily accounted for. In addition, the work of Milne promises to supply a rational basis for the hitherto purely empirical method of determining stellar parallaxes spectroscopically.

STRUCTURE OF THE UNIVERSE. In the distribution of the stars over the sky, as ascertained by statistical studies of star counts in selected regions, there exist in different galactic longitudes (after allowance is made for stars blotted out by the obscuring clouds of dust and nebulosity in the great rift of the Milky Way) systematic departures in the number of stars per unit area at each galactic latitude from the *average* for that latitude, of a character which indicates that the solar system is at some distance from the centre of the galaxy, though almost exactly in its central plane. The centre of the galaxy is found to lie in the direction of Sagittarius (where five times as many stars are visible as in the opposite direction), but this centre itself, probably distant about 65,000 light years, is concealed behind the impenetrable cosmic clouds of the Milky Way.

Furthermore, the brighter stars are not distributed over the sky in exactly the same manner as the fainter ones, and a study of the differences shows that within the larger stellar system or galaxy there must be immersed a secondary aggregation, of many million stars, of which our sun is a member. This local cluster, the nucleus of which is composed of the bright, hot, massive, helium stars, comprises nearly all stars brighter than the sixth magnitude. Its diameter is about 20,000 light years, and its influence can be traced to stars of the sixteenth magnitude; probably three-fourths of all the stars in the immediate neighborhood of the sun are members. The sun is 300 light years from the centre of the local cluster and 150 light years outside its central plane; this central plane is inclined twelve degrees to that of the galaxy, and the cluster itself is a little south of the galactic plane.

It is probable that the galactic system resembles rather closely such highly resolved spiral

nebulae as Messier 33, consisting of a central condensation, knots, scattered stars, and diffuse nebulosity, the whole being 200,000 to 300,000 light years in diameter. The local cluster forms an exceptionally large and dense outlying spheroidal aggregation or knot in one of the arms. The galaxy itself is but one of many such systems, which together form a "galaxy of galaxies," and about which our information is rapidly increasing due to the notable work of Shapley and others.

Lindblad attempted to account for observed stellar motions by supposing the galaxy to consist of a number of subsystems, each in approximately dynamical equilibrium, rotating, about a common axis perpendicular to the galactic plane, with different speeds; and this theory, though presenting difficulties, has been rendered fairly plausible by recent work of Oort, Schilt, and J. S. Plaskett.

ASTROPHYSICS. At the Mount Wilson Observatory, an attempt has been made to determine the relative amounts of each of various chemical elements in the atmospheres of the sun and the stars. For this purpose, groups of related spectrum lines known as "multiplets" are used; the relative numbers of atoms involved in the production of such lines may be calculated from modern spectroscopic theories. It is found that fully a million times as many atoms are active in producing the strongest lines in the solar spectrum as in giving rise to the lines barely visible. Stellar spectra are now being regularly obtained with high dispersion on a scale comparable with that of solar spectra; and from these it is found in a like manner that the amount of vapor of iron, titanium, and similar metals in the atmospheres of the great red giants such as Betelgeuse and Antares is about one hundred times as great as on the sun; these stars have very extensive atmospheres, and the lines are produced in regions of low pressure, so that in spite of the low temperatures, the "enhanced" lines of iron and titanium are stronger than those in the solar spectrum.

Fifty-seven elements have now been found in the sun, and there can be but little doubt that all known elements are present, though the physical conditions in the sun prevent the lines of some from being intense enough to be seen; those elements not yet identified are nearly all of either high atomic weight or high ionization potential, while the elements having low ionization potentials are all known to be present; boron, the strongest lines of which lie in the unobservable ultra-violet portion of the spectrum, was recently identified in sun-spot spectra through the band spectra of its compounds. Many lines of known elements, predicted by spectroscopic theory but not yet observed in the laboratory, have recently been found among the hitherto unidentified lines in the solar spectrum. I. M. Freeman has identified nearly all the emission lines in the coronal spectrum with argon.

Planetary nebulae are stimulated to shine by the action of the radiation given out by the central star; the intensities of the nebular spectrum lines lead to an estimate of 100,000° for the temperature of the hotter of these nuclear stars. So excessively hot a star gives out a great deal of radiation of such short wave-length that it highly ionizes the nearby atoms; electrons are ejected with high speed, and by "inelastic collisions" impart just enough energy to other atoms

to put the latter into the metastable condition and cause them to radiate the characteristic nebular lines. Thus the short wave radiation from the star is transformed into the energy of motion of electrons, and thence into the nebular radiations. Longer wave-length radiation will penetrate farther into the nebula before being depleted, but will not ionize the atoms so highly, so that the planetaries consist of a series of concentric shells in which the ionization is greater the nearer the central star is approached, and this explains the relative sizes and intensities of the monochromatic images of planetaries given by a slitless spectroscope—the exciting power of the star decreases outward, and the order of size of the images is exactly that of the ease of excitation of the wave-length of the light given out by each.

Similarly in the diffuse nebulae, the lines requiring high energy for their excitation are strongest in the central regions, and fade out near the borders of the nebula before the more easily excited lines do. The reason the “metastable” lines are developed to the exclusion of the normal ones has been shown to lie in both the low density and the comparative weakness of the stimulating radiation.

The comparative rarity of bright lines in stellar spectra shows that the conditions for their formation are not normally present. Several possible causes for them have been suggested: In the case of nebulous stars, and Wolf-Rayet stars, they may be essentially fluorescent phenomena produced by the nebulous envelope. They can also originate from a special accumulation of atoms above the photosphere, as in the case of the reversal of the H and K lines produced in the solar spectrum by the floccular regions, an effect typical of many late-type dwarfs. Gerasimovich has attributed the bright lines of hydrogen and ionized iron in the emission spectra of supergiants of classes B0 to F5 to a highly penetrating radiation coming from local sources near the surface.

As a result of the extensive recent investigations of Struve and others, it is coming to be generally accepted that the fixed calcium lines in stellar spectra are due to diffused interstellar calcium clouds; the intensity of the lines is a function of distance, and the late-type stars are too near to show them.

Precise measurements of the penetrating cosmic radiation by Millikan and Cameron have led these investigators to attribute this radiation to the creation, in interstellar space, of light atoms such as helium, oxygen, silicon, magnesium, and iron, out of primordial positive and negative electrons. Jeans, however, maintains that this theory conflicts with the second law of thermodynamics, and that creation of matter is impossible; only disintegration from heavier to lighter atoms, and dissolution of matter into radiation, can take place.

STARS. The investigations of Seares and others have confirmed what Halm suspected in 1911, that there is an approximation to equality in the energies of motion of massive and of light stars; the heavy stars move more slowly, so that stellar velocities, like those of the molecules of a gas, conform to the law of equipartition of energy. This can be due only to gravitational interaction of the stars extending over *millions* of *millions* of years, and hence the stars must have an age of this order of magnitude; a great

deal of other astronomical evidence leads to the same conclusion.

Measurements of stellar radiation with delicate thermo couples by Pettit and Nicholson at Mount Wilson have shown that Sirius, though visually the brightest star, is only the third brightest radiometrically—more heat reaches the surface of the earth from both Betelgeuse and Antares than from Sirius; however, a larger part of the radiation of Sirius (which is a blue star) is lost in the earth's atmosphere, so that it actually sends more heat to the solar system than the others. A solar-type star of the sixth magnitude radiates on the whole United States about the same amount of heat as is received from the sun on one square yard; when the heat from such a star is focused on a thermo couple by the 100-inch telescope, the temperature of the receiver is increased about one half-millionth of a degree Fahrenheit, causing a current of about one twenty-billionth of an ampere to flow through the galvanometer. The image of Betelgeuse raises the temperature of the receiver by 0.015° C.

The application of modern microphotometers to the study of photographs of stellar spectra has led to many interesting results, especially at the Harvard Observatory. For example, a theory of Unsöld as to the formation of absorption lines permits the contours of the lines to be used to deduce the number of atoms of different elements in the stellar atmospheres. Boxandall has attributed the unidentified bands in the spectrum of Mira to aluminum oxide. The unusual phenomena of Nova Pictoris has led several investigators to conclude that the outburst was due to a collision between two stars.

SUN. By using plates sensitive to infra-red light of wave-length 8500 Å., G. Blunck has obtained photographs that show what appears to be the outline of the corona. After reviewing all theories of the corona yet proposed, W. Anderson has concluded that none except the Schwarzschild theory of an “electron gas” can be maintained. Pettit and Nicholson have shown that their measurements of the distribution of energy in the coronal spectrum agree with that calculated by Woltjer for sunlight diffused by an atmosphere of electrons.

COMETS AND METEORS. The observed motions of the matter in cometary tails are not yet fully understood. The material is in some way ejected from the nucleus with considerable velocity, and moves under the combined influence of gravitation and of repulsive forces from the sun. An investigation, by Bobrovnikoff, of the motions in the tail of Comet Morehouse 1908 III has shown that the repulsive force acting was exactly of the amount that Baade and Pauli have calculated would be exerted on ionized carbon dioxide molecules under radiation pressure from the sun, and the spectrum showed the light actually to consist chiefly of the “resonance” radiation of this gas. The matter was ejected directly away from the sun. These results do not agree with the Bessel-Bredichin theory of the formation of the tail out of envelopes ejected on the sunward side.

Important advances in the dynamical theory of the motions of meteors passing through the upper atmosphere have been effected by Fisher. By taking into account the influence of the earth's equatorial bulge, which draws a meteor toward the earth's surface, and of the rotation of the earth, which prevents the projection of the path on the earth from being a great circle, he has

succeeded in satisfactorily accounting for the observed motions of the great meteoric procession of Feb. 9, 1913, seen from Saskatchewan to Long Island, and by ships south of the equator.

MISCELLANEOUS. Boss, who has found that the variations in the rate of rotation of the earth revealed by the fluctuations in the motions of the sun, moon, and planets are also indicated by star positions and clock rates, suggests that these variations may be due to earth tides, both because of friction and because of a failure of the crust to settle back from high tide to its original position, thus increasing the earth's diameter and slowing up the rotation until a critical point is reached, when settling starts and the rotation speeds up again.

Three comets appeared in 1928: The first was discovered by Reinmuth at Heidelberg, February 22; the second by Giacobini at Paris, March 17; the third by Forbes at Cape Town, November 21.

The California Institute of Technology, in co-operation with the International Education Board and the Carnegie Institution of Washington, had determined to establish an astrophysical observatory having a 200-inch reflecting telescope with a mirror of fused quartz.

NECROLOGY. The list of prominent astronomers dying in 1928 includes: Edward Walter Maunder, March 21; Wm. Edward Plummer, May 22; Wm. Reid, June 8; Samuel Oppenheim, August 15; Pierre Henri Puisseux, September 28; Sydney Royston Pike, November 22.

BIBLIOGRAPHY. Important books of the year included, J. H. Jeans, *Astronomy and Cosmogony* (Cambridge, England); E. A. Fath, *Elements of Astronomy*, 2d ed. (New York); E. E. Smart, *The Sun, the Stars, and the Universe* (London).

ASTROPHYSICS. See ASTRONOMY; PHYSICS.

ATHLETICS, TRACK AND FIELD. With the Olympic Games (q.v.) as the incentive, unusual activity characterized track and field athletics, particularly in the United States, Germany, and Great Britain. A list of the outstanding performers of the year 1928 would include Ray Burbuti, Robert King, Edward Hamm, Sabin Carr, Edward Houser, Frank Wykoff, Charles Borah, Lloyd Hahn, Ray Conger of the United States; Willie Ritola and Paavo Nurmi of Finland; Dr. Otto Peltzer of Germany; Pat O'Callaghan of Ireland, Percy Williams of Canada, and Lord David Burghley of England. The name of El Ouafi, the Algerian who won the Olympic Marathon, also deserves mention.

The invariably colorful indoor track season of the United States was featured by the presence among the competitors of Dr. Otto Peltzer of Germany. The visitor opened his campaign at the Millrose A. A. meet in New York City immediately after finishing a tour of some 10,000 miles and with practically no experience on indoor tracks. Nevertheless, Peltzer was able easily to win the 1000-yard run against a strong field. Ray Conger, eight days later, defeated Peltzer in the Illinois A. C. games much to the surprise of the onlookers. Soon afterward Conger triumphed over Lloyd Hahn and finally a three-cornered race between Peltzer, Hahn, and Conger was contested under the auspices of the Knights of Columbus in New York City. Here Hahn scored an impressive victory.

Among the world record performances of 1928 that of Frank Wykoff, a California high school lad, has never been approached. Young Wykoff, during Olympic trials held at Cambridge, Mass., ran the 100-meter distance four times in four hours and on each occasion equaled the world time of $1\frac{3}{5}$ seconds. This time had been tied only twice in twelve years before Wykoff's feat. Shortly before the Cambridge Olympic tests, J. Morgan Taylor broke the world record for the 400-meter hurdles by covering the distance in 52 seconds.

Four American indoor records were established during the year. James F. Quinn of Holy Cross College ran 60 yards in $6\frac{1}{2}$ seconds; Lloyd Hahn covered 880 yards in 1 minute, $51\frac{1}{2}$ seconds; Sabin W. Carr of Yale University pole-vaulted 14 feet, 1 inch; H. H. Schwartz of the Illinois A. C. put the 16-pound shot 49 feet, $67\frac{1}{2}$ inches.

Eight new American marks were set in the outdoor competitions as follows: 200 meters, Frank Wykoff, Glendale High School, Los Angeles, Calif., $20\frac{4}{5}$ seconds; 400 meters, Emerson L. Spencer, Stanford University, 47 seconds; 800 meters, Lloyd Hahn, $51\frac{1}{2}$ seconds; 1500 meters, Ray Conger, 3 minutes, 55 seconds; 10,000 meters, Joie W. Ray, Illinois A. C., 31 minutes, $28\frac{3}{4}$ seconds; 400-meter hurdles, F. Morgan Taylor, Illinois A. C., 52 seconds; running broad jump, Edward Hamm, Georgia School of Technology, 25 feet, $11\frac{1}{4}$ inches; decathlon, J. Kenneth Doherty, Cadillac A. C., Detroit, 7,600.52 points.

Women participated more generally than ever in track and field sports and several new records were set up in the various meets held throughout the United States. Notable among these achievements were; indoors, 50 yards, Helen Filkey, Illinois A. C., $6\frac{1}{5}$ seconds; 220 yards, Catherine M. Donovan, Prudential L. C. A. A., $28\frac{4}{5}$ seconds; running high jump, Mildred O. Wiley, Boston S. A., 4 feet, $11\frac{3}{4}$ inches; standing broad jump, Katherine R. Mearis, Boston S. A., 8 feet, $1\frac{1}{4}$ inches; putting 8-pound shot, Rena MacDonald, Boston S. A., 37 feet, 11 inches; 800 meters, Catherine M. Donovan, 2 minutes, $33\frac{3}{5}$ seconds.

New outdoor standards set by women in 1928 were: 50 yards, Anne Vrana, Pasadena A. and C. Club, 6 seconds; 100 meters, Elizabeth Robinson, Illinois A. C., 12 seconds; 220 yards, Elsie Schurke, Illinois A. C., $27\frac{3}{5}$ seconds; 300 meters, Rayma Wilson, Pasadena A. and C. Club, $43\frac{1}{5}$ seconds; 60-yard hurdles, Helen Filkey, Illinois A. C., 8 seconds; running broad jump, Nellie Todd, Illinois A. C., 17 feet, 11 inches; throwing baseball, Vivian Hartwick, Northern California A. C., 252 feet, 4 inches; discus, Lil-

lian Copeland, Pasadena A. and C. Club, 115 feet, 6½ inches.

In the intercollegiate competition, Stanford University won the I. C. A. A. A. championship for the second consecutive year. The Los Angeles A. C. of California captured the national senior A. A. U. title, thus making the Pacific Coast State supreme in the United States athletic world. See OLYMPIC GAMES.

AUFFENBERG-KOMAROV, FIELD MARSHAL MORITZ, FREIHERR VON. Austrian soldier, died at Vienna, May 18. He was born at Troppau, in Austrian Silesia, May 22, 1852, and was educated at the cadet school, Hainsburg, and the Academy of Wiener-Neustadt. He received his commission as a lieutenant in 1871, and in 1878 was with the forces that occupied Bosnia. He advanced in the army through the grades until 1905, when he became a field marshal and served in the ministry of war. In 1907 he was inspector general of the imperial military academy, and in 1909 commanded the Fifteenth Army Corps at Sarajevo. In 1911 he became minister of war but held the portfolio a short time only, owing to the failure of his plans to increase the man-power of the Austro-Hungarian Army and strengthen the fortifications in the Tirol. In 1912 he resigned and returned to active duty as inspector general of the army. At the outbreak of the World War, von Auffenberg was held in high esteem in his country as one of its leading generals, and he increased his prestige by his victory over the Russians in the eight-day battle of Komarov, Aug. 26 to Sept. 2, 1914. As a distinction, he was permitted to add "Komarov" to his name. After the battle he succeeded in the difficult task of changing the entire front of his army and marched it southward to take part in the second battle of Lemberg. Here he delayed but could not avert the victory of the Russians, by which they won all of eastern Galicia. Auffenberg-Komarov's failure to win another victory was a bitter disappointment to Austria-Hungary, and in October, 1914, he was deprived of his command and called upon to explain, before a military tribunal, his part in the battle. He was unanimously acquitted, but subsequently played little part in the War, retiring from service in 1915. After the collapse of Austria he began to write his memoirs, and completed and published two volumes.

AULARD, ô'lâr, FRANÇOIS-VICTOR-ALPHONSE. French historian and educator, died at Paris, October 23. He was born at Montbron, Charente, July 19, 1849, and he attended the collège Sainte-Barbe, and the lycée Louis-le-Grand, later specializing in French history at l'Ecole Normale supérieure. He joined the faculty of the lycée de Nîmes, in 1871, and transferred to the lycée de Nice two years later, where he remained until 1876. He served on the Facultés des Lettres at Aix, Montpellier, Dijon, and Poitiers, from 1878 until 1884, leaving to teach for a year at the lycée Janson-de-Sailly. Recognized, through his writings and his educational work, as an authority on the French Revolution, he was appointed professor of that subject at the University of Paris, in 1885, continuing on the faculty, as honorary professor, until his death. Professor Aulard served as president of the Commission supérieure des Archives, and of the Société d'His-

toire de la Révolution. He was department chairman of the comité central of the Ligue des Droits de l'Homme, and a member of the managing committee of *Le Quotidien*. Besides being a student of history, he tried to influence the policies of his government toward reconciliation with the German Republic. He urged liberalism in articles in *l'Ère Nouvelle*, and *Progrès Civique*, and while presiding over the executive committee of the Berlin meeting of the International Federation of the League of Nations Societies, in 1927. Professor Aulard's books, which are accorded a high place among French histories, include: *Histoire politique de la Révolution française* (5th ed. 1905); *L'Eloquence parlementaire pendant la Révolution française* (2d ed., 1907); *Recueil des actes du Comité de Salut Public* (26 vols., after 1890); *Taine, historien de la Révolution* (1907); *Napoléon et le monopole universitaire* (1909); *Lettres et Bulletins de Barentin à Louis XVI, avril-juillet 1789* (1915); *La Guerre Actuelle Commentée par l'Histoire* (1916); and *Dictionnaires des Conventionnels de Auguste Kuscinski* (1916-19); *La Révolution française et le régime féodal* (1919); and *Le Patriotisme français, de la Renaissance à la Révolution* (1922); *Histoire politique de la grande guerre* (with E. Bouvier, 1924); and *Le Christianisme et la Révolution française* (1925).

AURORA. See METEOROLOGY.

AUSTRALIA, COMMONWEALTH OF. A self-governing dominion of the British Empire, consisting of the six original states (formerly colonies) of New South Wales, Victoria, Queensland, South Australia, Western Australia, and Tasmania, together with the Northern Territory and the Federal Territory, and comprising the island continent of Australia with its dependencies. The present Commonwealth dates from its proclamation in 1901, under the act of union passed in the preceding year. Of the divisions mentioned above, the Northern Territory was transferred by South Australia to the Commonwealth; and the Federal Territory consists of a former portion of New South Wales. At the beginning of 1927 the seat of the government was at Melbourne, but on May 9, 1927, the new capital at Canberra was formally opened by the Duke of York.

ESTIMATED POPULATION OF AUSTRALIA ON
MARCH 31, 1928

States and Territories	Males	Females	Total
New South Wales ..	1,231,266	1,182,632	2,413,898
Victoria	870,089	878,571	1,748,610
Queensland	477,510	425,609	903,119
South Australia	298,431	278,145	576,576
Western Australia ...	214,128	181,728	395,851
Tasmania	105,158	106,885	212,043
Northern Territory ..	3,013	1,225	4,238
Federal Capital Territory	5,014	3,371	8,385
Total	3,204,559	3,058,161	6,262,720

AREA AND POPULATION. The area of Australia is 2,974,581 square miles and the population according to the census of Apr. 4, 1921, 5,435,734. The population of Australia on Mar. 31, 1928, was estimated by the Commonwealth statistician as 6,262,720, an increase of 122,838 as compared with the total 12 months previous. The figures indicate that since the census of Apr.

4, 1921, the population increased 826,986, of which the excess of births accounted for 559,872, or 68 per cent, and excess of arrivals over departures for 267,114, or 32 per cent. The average rate of increase of population in the Commonwealth was slightly more than 2 per cent per annum.

The figures given in the table on the preceding page do not include the full-blooded aborigines, whose number was estimated at 60,000. During 1927 there were 133,162 births, 56,952 deaths, and 47,865 marriages. The population of the capital cities with their suburbs on Jan. 1, 1927, was as follows: Sydney, New South Wales, 1,070,510; Melbourne, Victoria, 944,400 (estimated by the government statistician in November, 1928, at 1,000,000); Brisbane, Queensland, 274,260; Adelaide, South Australia, 316,865; Perth, Western Australia, 184,223; Hobart, Tasmania, 55,130.

EDUCATION. Throughout Australia primary education is compulsory and free, while there exists in all states a more or less liberal provision of scholarships and bursaries to the higher state schools, to the secondary schools, and to the universities. Provided that the requisite standard is reached it is permissible for children to receive home tuition, or to attend so-called private schools. At the end of 1926 there were in the six states of the Commonwealth 11,725 schools of all kinds, with 32,188 teachers. The scholars enrolled numbered 1,147,665 and the average daily attendance was 906,665. For details of education in the respective states and territories, consult the individual articles. At the capital of each state there is a university.

PRODUCTION, ETC. According to the Commonwealth statistician and actuary, the area under the principal agricultural crops and the yield for each during the season 1925-26 was as follows: Wheat, 11,706,984 acres, 160,852,369 bushels; oats, 1,013,233 acres, 12,211,657 bushels; barley, 374,876 acres, 6,356,297 bushels; maize, 297,140 acres, 7,431,561 bushels; hay, 2,832,003 acres, 2,677,945 tons; potatoes, 139,018 acres, 322,797 tons; sugar cane, 288,872 acres, 3,965,587 tons; vineyards, 112,697 acres, 252,192 tons of grapes. The wine production amounted to 16,231,142 gallons and the value of the produce from orchards and fruit gardens was £8,043,149. The number of livestock included: Sheep, 103,563,000; cattle, 13,280,000; horses, 2,250,000; pigs, 1,128,000. The estimates for the production of wool in 1928-29 were as follows: Clip, 815,000,000 pounds; pulled wool, 35,000,000 pounds; exported on skins, 50,000,000 pounds, making a grand total of 900,000,000 pounds of wool of various grades available for export.

Statistics for manufacturing in Australia, 1925-26, showed: Number of establishments, 21,242; hands employed, 450,920; salaries and wages paid, £86,724,683; value of plant and machinery, land and buildings, £208,813,782; value of materials used, £231,834,908; value added by manufacture, £157,484,783; value of output, £402,402,917. The year 1927 was not particularly prosperous for Australian manufacturers. They seemed to be suffering from heavy production costs, and failures occurred, in some instances involving fairly large concerns. Many requests were made for additional tariff protection in order to relieve conditions in certain industries which were laboring under severe depression. Additional

protection was imposed on certain textiles, machinery, motor chassis, food, and groceries, and the Government announced that it hoped to stimulate not only production in plants already established but also to induce additional industries to commence operations. The depression of 1927 was regarded by many as only temporary and 1928 was expected to be more prosperous generally.

The value of all minerals produced in the Commonwealth of Australia in 1926 was £23,951,291. The value of the more important minerals was as follows: Gold, £2,208,839; silver and lead, £4,930,925; copper, £560,181; iron, £1,255,784; zinc, £1,462,485; tin, £825,806; coal, £11,852,961.

Wheat	20,785,414	14,629,899
Flour	6,254,316	5,229,212

COMMERCE. Australian imports and exports were lower in value in 1927-28 than in 1926-27. The most noticeable feature of the decrease was the heavy decline in imports of merchandise. For the year ending June 30, 1927, excess of imports over exports amounted to £19,821,411 and

in 1927-28 to only £6,521,391. The adverse trade balance, accordingly, declined over £13,000,000. Exports of merchandise in 1927-28 showed an expansion of £5,258,727 over shipments in 1926-27, but this was more than offset by a decrease in exports of specie and bullion. A comparison of the totals of trade for 1926-27 and 1927-28, and the movement involved, is afforded by the table given on page 73.

The values of the principal items in Australian trade in merchandise during 1927-28 are compared with those for the previous fiscal year in the accompanying table:

The greatest decrease in imports for the year occurred in receipts of motor-car chassis and parts, which showed a decline of over £5,000,000 as compared with the corresponding 1926-27 figures. There was also a noticeable decrease in imports of textiles. Higher prices for wool raised the value of exports of this commodity considerably. The poorer wheat harvest on the other hand, resulted in a decrease of £6,155,515 in the value of wheat sent overseas. Exports of sheepskins increased nearly £1,000,000, but the value of rabbit skins declined. Butter exports increased £1,438,571 in 1927-28 as compared with

bullion, and merchandise, respectively, for 1926-27. There was a decrease of but £1,390,414 in 1927-28 in exports of merchandise. The total value of imports from the United States to Australia in 1927-28 amounted to £35,520,981, compared with £41,331,798 in 1926-27, a decrease of £5,810,817.

FINANCE. The budget estimates for 1927-28 were presented to Parliament by the Commonwealth treasurer on Sept. 28, 1927—somewhat later than usual. The delay was due to the transfer of the seat of government from Melbourne to Canberra, which has now become the permanent home of the Commonwealth Government. Total ordinary revenues provided in the budget (consolidated revenue fund) are estimated at £78,860,190, while total ordinary expenditures from consolidated revenues, including contribution toward payment of interest charges on state debts, are estimated at £78,812,329. Provision is also made for extraordinary expenditures of £9,000,000 for Commonwealth purposes out of the loan fund. The budget estimates, ordinary revenues, and expenditures for 1927-28 are shown in the following table:

COMMONWEALTH BUDGET ESTIMATES,
(From Commonwealth Treasurer's statement)

CONSOLIDATED REVENUE FUND, 1927-28
presented to Parliament of Sept. 28, 1927)

Revenue	1926-27 (actual) £	1927-28 (estimated) £	Expenditures	1926-27 (actual) £	1927-28 (estimated) £
Indirect taxation:			War, repatriation, and defense ^a	34,000,365	34,326,658

Commonwealth railways	477,734	575,000	Total ordinary expenditures	67,269,726	69,664,417
Total business undertakings	12,126,372	12,966,000	Capitation payments and special grants to States	8,262,912	678,000 ^e
Commonwealth Territories	47,175	169,190	Contributions toward interest and sinking fund on State debts		8,469,912
Other revenues	6,999,879	7,175,000	Total expenditures	75,532,638	78,812,329
Total revenues	78,168,235	78,860,190	Surplus	2,635,597	47,861

^a Including interest and sinking fund on Commonwealth debts.

^b Other than on war loans.

^c Includes grants to States for main roads.

^d Other than defense and post office.

^e Special grants to Tasmania and Western Australia only.

1926-27 shipments. A decline of over £1,000,000 appeared in exports of flour.

Trade between Australia and the United States suffered considerably in the year ended June 30, 1928, because of depressed conditions throughout the Commonwealth, although the United States' share of Australia's total imports declined but slightly. The value of exports from Australia to the United States in 1927-28 amounted to £9,113,353 as compared with £18,502,834 in 1926-27. Of the 1927-28 total £2,001,422 represented exports of specie and bullion and £7,111,931 represented exports of merchandise, as compared with £10,000,590, and £8,502,244, for specie and

The budget for 1927-28 was based on the assumption that the financial agreement between the States and Commonwealth would receive the consent of the state legislatures and the Commonwealth Parliament. Accordingly provision was made in the budget for the contribution by the Federal Government of the sum of £8,469,912 toward interest and sinking fund on the states' debts. In line with this agreement there was provided an additional sum of £165,533 to cover increased interest payments to the states on the value of properties transferred to the Commonwealth upon and after federation. Other salient features of the budget were the reductions in

income- and land-tax rates. The income-tax rate reached a peak in 1920-21 when it was nearly 71 per cent above the original rate adopted in 1915. Reductions were inaugurated in 1922-23 and by 1925-26 the rate was reduced to 20 per cent above the original. It was proposed, in order to give further relief to the individual taxpayer, to reduce the rate to 10 per cent above the original. A 10 per cent reduction was also proposed in the land tax. The total reductions thus effected were expected to be partly covered by increased receipts from customs and excise duties.

which had beset the Commonwealth in the last few years, when he wished to keep labor out of power. One of these disputes occurred during September, when a strike, accompanied by violence, occurred in the shipping industry. The strikers defied the governmental channels which had been set up to meet such emergencies, and for a time it appeared that open revolt against the Commonwealth Government might take place, but strong measures by the central Government and the Governor of South Australia, soon had the strike well in hand, although the effect on

COMBINED COMMONWEALTH AND STATE PUBLIC DEBT, ON JUNE 30, 1921 TO 1927

<i>Debt on June 30—</i>	<i>Public debt of Commonwealth</i>	<i>Public debt of States</i>	<i>Aggregate</i>	<i>Deduction for duplication</i>	<i>Combined debt</i>

1928	494,129,100

^a Includes £2,024,022 representing net amount of Commonwealth indebtedness on account of Federal Capital Territory.

COMMUNICATIONS. The total number of registered vessels in 1926 was 2232 of 398,799 tons. In the oversea trade of 1926-27, 1624 vessels of 5,558,875 tons entered and 1637 of 5,605,100 tons cleared the ports of Australia. The total mileage of railways open to traffic in 1927 was 25,513 miles.

GOVERNMENT. The executive power is vested in the king, who acts through a governor-general, assisted by an executive council of responsible ministers, who must be members of the federal parliament, comprising a senate and house of representatives. The senate consists of at least six members from each of the original states, elected for six years, one-half of whom are renewed every three years; while the house of representatives consists of approximately twice as many members as there are senators, the representation being apportioned among the several states according to the population shown at the last census. The number in the house in 1928 was 76 and in the senate 36. The Governor-General in 1928 was Baron Stonehaven of Ury, and the ministry was as follows: Prime Minister, Minister for External Affairs, and Minister for Health, Stanley M. Bruce; Treasurer, Dr. E. C. G. Page; Home and Territories, C. W. C. Marr; Attorney-General, J. G. Latham; Postmaster-General, W. G. Gibson; Trade and Customs, H. E. Pratten; Works and Railways, W. C. Hill; Defense, Sir T. W. Glasgow; Repatriation, Sir N. R. Howse; Vice President of the Executive Council, Sir G. F. Pearce; Markets and Migration, T. Paterson; Honorary Ministers, T. W. Crawford and A. J. McLachlan.

HISTORY. Australia passed a comparatively uneventful and fairly prosperous year. Prime Minister Bruce strengthened his political fences by cementing the friendships between his Nationalist party and the Country party under the leadership of Dr. Page, which had one common end in the suppression of the Labor party and the prevention of its rise to power in the Commonwealth Government as it had done in the various state governments. It was only a coalition between the Nationalist and Country parties that permitted the Bruce government to retain power after the elections of 1925. Perhaps Premier Bruce had in mind the many labor difficulties

business was such that it was feared that Australia would take a long time to emerge from the serious depression which she had been in since 1926.

On October 9, the central Parliament was dissolved and a general election was called for November 17. The chief issue of the campaign, which was very hotly contested, was the question of arbitration, compulsory or otherwise, in industrial disputes. The Nationalist-Country party coalition hoped to strengthen their cause by showing the people that the shipping strike mentioned above had caused untold damages and might have been prevented had the strikers made use of the machinery established by the Government for arbitration. The Labor party advocated the repeal of the measures that Premier Bruce stood for and advocated, as well as the establishment of a protective tariff and the strengthening of the central Government at the expense of the states. The result of the election was favorable to the coalition government, although Labor made a gain of nine seats and the coalition lost a similar number. The Bruce government now controlled 43 votes as against 52 in the previous Parliament and the labor opposition controlled 32 as against 23. Premier Bruce made several changes in the membership of his cabinet. (See also EXPLORATION.)

AUSTRIA. A republic of central Europe, proclaimed Nov. 12, 1918, after the revolution following the World War; boundaries defined by the Treaty of St. Germain, signed Sept. 19, 1919. It consists of the following nine provinces; the City of Vienna, Lower Austria, Upper Austria, Salzburg, Styria, Carinthia, Tirol, Vorarlberg, and Burgenland.

AREA AND POPULATION. According to the census of Mar. 7, 1923, the total area was 32,369 square miles and the population, 6,534,481, giving a density of 202 persons to the square mile. The area of the Austrian provinces before the World War was 39,012 square miles and the population, according to the census of 1910, 7,529,935. According to the 1923 census, the City of Vienna, which constitutes a province, had a population of 1,865,780, making up 28.55 per cent of the total number of inhabitants. The other chief cities with their populations on Mar.

7, 1923, were: Graz, 152,706; Linz, 102,081; Innsbruck, 56,401; Salzburg, 37,856; Wiener Neustadt, 36,956; St. Pölten, 31,619; Klagenfurt, 27,423; Steyr, 22,111; Mödling, 18,677; Villach, 22,070; Wels, 16,412; and Baden, 22,217. The movement of population in 1926 was: Births 118,939; deaths, 94,081; marriages, 45,877; divorces (excluding Burgenland), 5350. The number of emigrants in 1926 was 3895.

EDUCATION. Primary education is compulsory between the ages of 6 and 14, but exemptions are easily obtained for children of the age of 12 and over. The cost of elementary instruction is borne chiefly by the communes and provinces. In 1925 there were in the Republic 5252 public and private elementary schools, with 29,125 teachers and 717,571 pupils. Secondary education is provided by gymnasia, realschulen, middle schools, and middle schools for girls. In 1925 there were 145 secondary schools of all types with 3593 teachers and 44,513 pupils. There are three universities maintained by the state, namely, Vienna, which had 824 teachers and 9511 students in 1925; Graz, 276 teachers and 2347 students; and Innsbruck, 195 teachers and 1567 students. There were also in the same year two technical high schools at Vienna; 37 training colleges for teachers; one theological high school; high schools for agriculture, mining, art, and music; and 12 theological colleges, of which 10 were for Roman Catholics.

PRODUCTION. Agriculture continues to be the principal occupation of the people. The total acreage sown in 1926 amounted to 4,766,708 acres. Of this total, 2,105,479 were in Lower Austria and 1,036,679 in Upper Austria. The principal crops with their acreage and yield in metric tons in 1926 were: Wheat, 500,334 acres, 256,864 tons; rye, 972,272 acres, 475,315 tons; barley, 362,352 acres, 197,555 tons; oats, 777,042 acres, 434,796 tons; potatoes, 439,043 acres, 1,297,782 tons; turnips, 128,596 acres, 1,202,449 tons. Although Austria is chiefly agricultural, the foodstuffs produced are not sufficient to meet the needs of the population. The production of raw sugar in 1925-26 was 78,145 metric tons. The latest livestock census showed 282,651 horses, 1,074,864 cows, 302,103 oxen, 68,143 bulls, and 717,236 calves.

Notwithstanding Austria was deprived of many of her mineral resources as a result of the World War, she still possesses minerals of considerable value. The production of lignite in 1926 was 2,957,700 tons and of anthracite, 157,300 tons. The output of iron ore was 1,094,400 tons in 1926, and of pig iron, 331,635 tons. Some copper, zinc, lead, and salt (76,768 tons in 1926) are also produced. Piano making, the manufacture of automobiles, furniture, and textiles represent the only industries of any importance. The nine factories of the Austrian tobacco monopoly in 1926 made 218,357,000 cigars, 4,568,362,000 cigarettes, and 48,967 metric quintals of smoking tobacco.

COMMERCE. The foreign trade of Austria in 1927 amounted to 5,180,000,000 schillings, of which 3,141,000,000 represented imports and 2,039,000,000 exports. The principal imports in 1926 were: Grain, flour, and rice (857,400 tons); coal and fuel (5,188,121 tons); wines (7,028,472 gallons); stone and building material (173,203 tons); raw cotton (29,935 tons); rubber (2272 tons); glass (15,381 tons); iron goods (41,744 tons). The principal exports were tim-

ber (1,502,535 tons); ores (77,426 tons); fruit (11,695 tons); sugar beet (7360 tons); furniture (25,651 tons); chemicals (39,970 tons). Austria is one of those countries which may normally be expected to show a trade deficit and yet maintain its economic equilibrium by other foreign income sufficient to offset its excess of imports over exports to some extent. It has been stated that a large part of the industries of the former Austro-Hungarian Empire are still owned in Austria and pay dividends to Vienna. The recovery of Vienna as a financial and commercial centre contributes important foreign revenue for services rendered. To this may be added the earnings on transit traffic, tourist trade, and remittances from Austrians abroad.

FINANCE. Total expenditures foreseen for 1928 amounted to 1,786,522,000 schillings, with total revenues of 1,630,977,000 schillings, leaving a deficit slightly over 155,000,000 schillings. Expenditures, however, include a sum of 191,120,000 schillings for capital investment, such as railway electrification, telephone-cable laying, road building, etc. Excluding investment items, the 1928 budget would show a surplus of approximately 35,600,000 schillings. As in 1927, in budgeting the state enterprises, the Government resorted to gross figures. The operating budget of the state railways is not included in the Federal budget, and the expenditures which appear on account of the railways are largely for capital purposes.

AUSTRIAN BUDGET PROPOSALS FOR 1928
(In thousands of schillings, each exchanging at \$0.1406)

Item	Actual, 1926	Estimated, 1927	Proposed, 1928
Expenditures			
Federal administration	1,015,704	1,073,539	1,144,054
Government monopolies	6,893	201,630	209,371
Government enterprises	47,418	327,624	338,404
State railways	108,348	105,608	94,693
Total	1,177,863	1,708,401	1,786,522
Revenues			
Federal administration	939,979	919,523	965,769
Government monopolies	199,740	390,130	408,870
Government enterprises	5,521	241,584	256,838
State railways	206	115	5
Total	1,145,446	1,551,302	1,630,977

In the budget of the Federal Administration proper, the expenditure for 1928, as compared with the budget estimates in 1927, showed an increase of 70,500,000 schillings, or 7 per cent; the estimated increase in revenue was 46,250,000 schillings, or 5 per cent. Of the total expenditure in this group, 203,000,000 schillings (18 per cent) were devoted to pensions, and 269,000,000 schillings (23 per cent) to social administration, principally unemployment doles, making a total of 472,000,000 schillings of unproductive expenditures that represent 41 per cent of the total expenditures of the Federal Administration. Expenditures on account of the national debt were estimated at 165,000,000 schillings, or 14.5 per cent of the total. Expenditures for military purposes increased from 79,700,000 to 88,600,000 schillings and constituted almost 8 per cent of the total expenditures.

Revenue from taxation was estimated at 679,000,000 schillings, as against 646,000,000 in 1927; while this figure is still below the 717,000,000 schillings actually collected in 1926, it should be remembered that it seems to be a matter of

policy with the Austrian Government to greatly underestimate its revenues. The budget estimates for the government enterprises showed a proposed deficit of 82,000,000 schillings. Of this sum, 75,300,000 schillings represented the net cost to the government of the postal and telegraph services.

COMMUNICATIONS. The Austrian Federal Railways, according to the official report for 1927, had a fairly successful year despite the economic difficulties which continue to beset the country. The length of the Austrian Federal Railways at the close of 1927 totaled 4863 kilometers, of which 1479 kilometers were double track. In addition, the Federal Railways were operating 944 kilometers of track for the account of private owners. Operating revenues during the year amounted to \$85,300,000 (\$82,100,000 in 1926) and operating expenses to \$78,600,000 (\$77,700,000 in 1926).

The rolling stock in operation at the close of the year comprised 2663 locomotives, 5460 passenger cars, 30,298 freight cars, and 1715 service and mail cars. The condition of the rolling stock depreciated greatly during the War and shortage of funds has made it impossible for the administration to restore it to efficient normal conditions. At the close of 1927 the management of the Federal Railways announced that it had decided to postpone indefinitely all electrification work for which definite commitments had not been made. (Consult preceding YEAR BOOK.) This decision had been subject to much criticism in government circles, as well as in the electrical industry, but up to the close of 1928 the administration had persevered in its policy of relinquishing its former schemes of electrification, nor did it appear likely that this policy would suffer any radical change in the near future. At the end of 1927, 593 kilometers of the state railways had been electrified, as compared with 474 kilometers at the end of 1926.

GOVERNMENT. According to the provisions of the constitution which went into operation on Nov. 10, 1920, Austria was declared to be a federal republic, composed of eight provinces and the city of Vienna. A president is chosen for four years by both houses of the legislature. He may not be reelected more than once. The legislature is bicameral, comprising an assembly (Nationalrat) and a first chamber (Bundesrat). The powers of the latter are advisory. At the elections held on April 24, 1927, the following parties were returned: Christian Socialists, 73; Social Democrats, 71; German Nationalists, 12; Peasants' party, 9. President in 1928, Dr. Michael Hainisch (elected in 1920, reelected in 1924). The ministry as formed on May 19, 1927, was composed as follows: Chancellor and Minister of Foreign Affairs, Dr. Ignaz Seipel (Christian Socialist); Vice Chancellor, Karl Hartleb (Peasants' party); Justice, Dr. Franz Dinghofer (Pan German); Social Welfare, Dr. Joseph Resch (Christian Socialist); Agriculture and Forestry, Andreas Thaler; Finance, Dr. Victor Kienböck; Commerce and Communications, Dr. Hans Schuerff; Education, Dr. Richard Schmitz; Defense, Karl Vaugoin.

HISTORY

Probably the outstanding development in Austrian history was the great decline in the strength of the Socialists, with the consequent increase in strength of the Clericals and the middle classes.

As noted in the preceding YEAR BOOK, a bloody

struggle occurred in July, 1927, which was virtually a revolt against the Seipel government. From that time on the power of the Socialists began to diminish, and at the close of 1928 it was confidently expected in many quarters that the year 1929 would see the passing of the remaining elements of Socialist strength, such as the rent laws. An outgrowth of the riotous summer of 1927 was the creation of a bourgeois private army, aimed primarily at the socialists' armed forces that paraded the streets of Vienna at will.

The struggle between the Clericals and the Socialists went on apace, however, although the Socialists were indubitably losing ground. Charges and countercharges were hurled at each group by the other and many times in the course of the year and some of the meetings of Parliament resembled real old-fashioned street brawls. In February, the Socialists exercised their constitutional rights and compelled the ministry to call a special session of Parliament. At this meeting the Socialists charged that the Government was using the newly formed bourgeois private army to coerce the Socialists to carry out the will of the Government. The lie was passed freely between the two groups and it was necessary to adjourn the meeting to prevent physical combat. At a local election in Vienna held early in March, the declining strength of the Socialists was further indicated when they failed to elect police commissioners.

THE TYROL QUESTION AGAIN. In the early part of the year the old question of the protection of the German minorities in Tyrol came to the fore again and resulted in extensive comment in the press of Austria and Italy, but nothing constructive was actually done to relieve the situation. On February 23, considerable time was devoted to the problem in the Austrian Parliament for the first time. Although the Tyrolese had complained long and bitterly because of the obvious attempts on the part of Italy to Italianize Tyrol, the Austrian Government had failed to take any notice of conditions there officially. On the above mentioned date, however, the matter was put before the Parliament in vigorous terms by Deputy Kolb, a member of Chancellor Seipel's own party. Kolb described in ringing terms the various restrictive policies undertaken by Italy with regard to citizenship, German associations, and freedom of speech and press. Chancellor Seipel himself, in a speech which was praised throughout Austria and in Central Europe in general, expressed his sincere feelings for the plight of his countrymen who were being ground under the heels of Mussolini. He claimed that Austria had no desire to interfere in the internal problems of a neighboring country, but that freedom of speech, which Austria believes in and practices, permitted the discussion of such problems in an orderly fashion and before a duly elected assembly. While deprecating the fact that his country could not appeal to Italy directly or to the League of Nations, he felt that the entire matter was before a higher tribunal than either of these, that is, the conscience of the world.

As was to be expected, Mussolini made one of his usual replies to any attack on Fascism. He categorically denied the Austrian charges and went on to show what Italy had done in a material way for the people and country of Tyrol. He was roundly applauded by his hearers, particularly when he greeted the suggestion that the League of Nations should investigate the

question of minorities with something closely akin to contempt for the League. He stated that this was the last time he would ever mention the question, but he wanted the Tyrolese, the Austrians, and the entire world to know that the Brenner Pass was a necessary safeguard for Italy and as such she was willing to defend it to her last drop of blood. He intimated that deeds would take the place of words in the future, commenting indirectly on the strength of Italy and the weakness of Austria.

The Austrian press reported Mussolini's speech with scarcely any comment. Diplomatic relations, however, became very strained with the result that the Italian ambassador at Vienna took his leave from that city for almost four months. The matter was virtually settled for the time being when Chancellor Seipel admitted to Mussolini that he was not interested in the political but merely in the cultural aspects of the situation. Needless to say, Chancellor Seipel was bitterly attacked both in Austria and Tyrol for his surrender to Mussolini's mailed fist. At the close of the year, the Tyrol question, although still a matter for diplomatic discussion, seemed destined to remain one of the sore spots of Europe, one which might rival the Balkans as being the "tinder box" of Europe.

UNION WITH GERMANY. "Anschluss," as the movement for a union between Austria and Germany was styled, was very much to the front during 1928, and seemed to be gathering momentum. Practically every shade of Austrian opinion seemed to be open to propaganda for a Teutonic union, even the extreme Catholics seeming to favor the scheme. The greatest manifestation of Anschluss occurred in the summer during the meeting of the Congress of Singing Societies, which gathered at Vienna presumably to celebrate the anniversary of Franz Schubert. The gathering of so many peoples from Germany and Austria was made the occasion for bringing Anschluss to the attention of the entire country. The speakers decried the movement as a political one, which is the typical French attitude toward it, and reiterated that it was purely cultural and fast becoming a fact even though no official recognition of it was being taken by either government. Dr. Seipel had taken a stand in opposition to such a union, but it was also a well-known fact that he would not enter into any economic agreement with any of the succession states which does not include Germany.

THE OCTOBER RIOTS. A repetition of the July, 1927, riots was narrowly averted in October, when on the seventh of that month the Socialists and bourgeois army came into near conflict at Wiener Neustadt, a city about 30 miles from Vienna and long known as a Socialist stronghold. The Socialists had made all arrangements to hold a parade, when it became known that the Heimwehr, as the bourgeois armed forces are called, planned to hold a parade in the same city at the same time. Many thought that this was merely a show of force on the part of the anti-Socialists and an indication of what would occur if the Socialists attempted to control the city of Vienna in the future by show of arms.

The announcements of the rival parades were out in time to allow the citizens of the city to make such provisions as they could against damage to private property. Shops were closed

and business was at a standstill. When the day came, the Federal Government sent 10,000 troops armed to the teeth with every known method of fighting rioting. These troops patrolled the streets so effectively, that although both the Socialists and the Heimwehr paraded, no fighting and consequently no casualties occurred. The only tangible result of the demonstration was a meeting of leaders of various political parties to consider the question of disarming political organizations.

THE ELECTION OF A PRESIDENT. According to the Austrian constitution, a president of the Republic is only eligible for reelection once. The first President, Dr. Michael Hainisch, was elected in December, 1920, and was reelected in December, 1924. Naturally his term of office expired in December, 1928, and the question of a successor was a pressing one, particularly when one considers the feeling between the Socialists and the Clerical party. Dr. Seipel, the Chancellor and leader of the Clerical party, suggested that the constitution be amended so as to permit Dr. Hainisch to be elected again. The Socialists opposed this on the grounds that it would create a dangerous precedent and might even lead the way to a dictatorship. They even hinted that Dr. Seipel had the latter idea in mind and if the constitution were amended might become a candidate for the presidency himself.

When the Socialists remained obdurate, Dr. Seipel cast his strength in favor of the candidacy of Wilhelm Miklas, president of the National Assembly and a member of his own party. Herr Miklas was elected on the third ballot, the first two failing to give a majority. The Socialists, who were supporting Karl Renner, cast blank ballots, when the third vote was taken. The new President was 56 years old and was an educator before entering politics. He had presided over the National Assembly since 1923. In most quarters he was looked upon as an opponent of Anschluss, but he was a very available candidate because he had made very few political friends. Before the balloting, Dr. Seipel attempted to have Dr. Hainisch elected for a term of one year, during which time a consideration of the constitution would be taken up with a view to broadening the powers of the President as well as permitting him to be elected by the people instead of by Parliament. This proposal was defeated by the assembly, but it was expected that some changes would be made even if the Chancellor had to make concessions to the Socialists to gain the two-thirds majority which was necessary to amend the constitution.

AUTHORS' LEAGUE OF AMERICA. A national organization of authors, artists, dramatists, and screen writers; founded and incorporated in 1912, for the purpose of: procuring adequate copyright legislation, both international and domestic; protecting the rights and property of all those who create copyrightable material; advising all such in the disposal of their productions and obtaining for them prompt remuneration therefor; disseminating information among them as to their just rights and remedies. The League supplies to its members confidential information relating to publishers, theatrical and motion-picture producers, art buyers, and other persons and companies engaged in the purchase, sale, publication, or production of copyrightable material. The League is divided into four de-

partments or guilds; the American Dramatists, the Authors' Guild, the Guild of Free Lance Artists, and the Screen Writers' Guild. The officers for 1928 were: President, Owen Davis; vice president, Arthur Train; secretary and treasurer, Louise Silcox. The headquarters of the League are at 2 East 23rd Street.

AUTOGYRO. See **AERONAUTICS.**

AUTOMOBILE RACING. Louis Meyers of Redlands, Calif., won the highest rating among the automobile racing drivers in 1928. The annual 500-mile classic at the Indianapolis Speedway, which was witnessed by 150,000 persons, was won by Meyers who covered the distance in 5 hr., 01 min., 33.75 sec., averaging 99.482 miles per hour. Ray Keech of Philadelphia ranked next to Meyers in successful competition, winning the 100-mile race at Syracuse, N. Y., and the 185-mile contest at the Rockingham Speedway, Salem, N. H., as well as the Atlantic City Speedway race over a 100-mile course.

Captain Malcolm Campbell, famed English driver, lowered the world record for a mile at Daytona Beach, Fla., traveling at the rate of 206.95602 miles an hour. In attempting to better this record Frank Lockhart was killed at the same place. Keech, however, improved Campbell's mark at Daytona Beach, his time being 207.5526 miles an hour. In addition to Lockhart, Fred Comer, another driver, was killed at the Salem, N. H., track and Norman K. Batten and Earl DeVore lost their lives when the Vestris sank off the Atlantic coast.

AUTOMOBILES. In 1928 American automobile production again established a new record. The total production of cars and trucks in the United States and Canada was 4,630,000, or nearly 30 per cent more than that in 1927 (3,573,671) and nearly 3 per cent greater than the best previous year, 1926, when it was 4,503,531. The year was eventful on the business side of the industry, opening as it did with Ford still preparing for production of the new Model A, and speculation rife as to whether it would get into production soon enough to compete with its rivals in the lowest-price class. Throughout the first half of the year production was small for Ford, but in the latter half was speeded up so that the year closed with considerably more than half a million of the new models sold.

Many important developments in the way of new models came toward the close of the year. One of the most interesting was the introduction of the six-cylinder Chevrolet, displacing the four and selling at practically the same price, revealing the direction in which the General Motors Corporation was proposing to combat Ford competition. This also meant the entire abandonment of the four-cylinder field by General Motors, as it was building only sixes and eights.

Earlier in the year the new Buick was presented in an entirely new body design and radically improved mechanically. Later came the new "400" series of the Nash and finally many other new models were announced just before the opening of the National Automobile Show in January at New York.

Pierce-Arrow made its debut in the eight-cylinder field. Packard discontinued its six-cylinder line and produced only eights. Hudson and Essex remained in the six-cylinder fold but have been greatly improved mechanically and reduced

in price. A number of the new lines offered considerably more at lower figures than ever before.

Characteristic of all the new models was greater attention to eye appeal in body lines and color. Practically all lines showed some mechanical improvements as well, although mainly in the nature of refinements rather than radically new features. Two more cars had four forward-speed transmissions, the Durant and the Stutz. The Graham-Paige had introduced this feature the year before. The Willys-Knight and Whippet cars featured a new finger-tip control of the horn, lighting, and starter from one button on the top of the steering column.

New models as a whole reflected efforts toward greater comfort and convenience for driver and passengers. Easier gear shifting, simplified chassis lubrication, quicker "pick-up" through more power and less tiring steering and braking controls were generally evident. Four-wheel brakes were universally supplied, the last of the two-wheel-brake cars having changed to the four-wheel type. In means of operation as between the mechanical and hydraulic types, adherents to one or the other form were about equally divided and it remained to be seen which if either of these types would ultimately predominate.

In the effecting of easier riding qualities, there had been marked improvement in spring suspensions, the provision of shock absorbers as standard equipment on almost all cars except a very few lower-priced lines, better weight distribution, wider and more comfortable seats—all to overcome jars and bumps from the road. To reduce vibration from the motive parts, there was more use of rubber insulators in engine and other mountings, better engine counterbalance, vibration dampeners, lighter reciprocating parts and quieter gearing.

STATISTICS. Toward the close of 1928 the usual statement from the National Automobile Chamber of Commerce of preliminary facts and figures of the automobile industry gave the information from which the following is taken:

Of the total production in the United States and Canada in 1928 before mentioned, 4,630,000, passenger cars represented 4,044,000 and motor trucks 586,000. Of the passenger cars 3,441,600, or 85 per cent, were closed models. This is a reversal of the situation in nine years, for only 17 per cent of the cars produced in 1920 were closed. The wholesale value of the vehicles produced during the year was \$3,045,820,000, made up of \$2,630,500,000 for passenger cars, or 86 per cent, and \$415,320,000 for trucks. The average retail price of cars was \$876 and of trucks, \$950.

Tire manufacturers in the United States produced in 1928, 78,500,000 tires. The wholesale value of tires sold for replacement was \$670,000,000. The wholesale value of parts and accessories for replacement and of service equipment sold totaled \$950,000,000.

The number of motor vehicles in use throughout the world in 1928 was computed to be 31,725,000. Registration in the United States accounted for 24,750,000, or 78 per cent, of which 21,630,000 were passenger cars and 3,120,000 motor trucks. The gain in motor-vehicle registration in the United States over the previous year was 7 per cent. Nearly a quarter of these vehicles, or 5,450,000, were owned by farmers.

The United States had 3,013,584 miles of highways about a fifth of which, 615,000 miles, was surfaced.

During the year 1928 the making, selling, and repairing of motor vehicles with allied lines gave employment to 4,110,000 persons. The Federal and State governments collected during the year taxes on motor vehicles amounting to \$785,386,000. This included motor-vehicle registrations, gasoline taxes, and excise taxes up to May 29, 1928, on which date these taxes were removed.

Purchasing out of income was being more and more recognized by bankers, writers on financial questions, and students of economics as a sound practice bringing within the reach of those of moderate means benefits they would not otherwise enjoy and stimulating business for the producers of utilities. In this connection it is interesting to observe that 58 per cent of new cars were sold on time with an average note at time of purchase of \$606 and 52 per cent of new trucks with purchase notes averaging \$832. Used cars also were largely bought on time with an average purchase note of \$295.

Something of what the automobile industry means to other lines of business is shown by the following figures: The railroads in 1928 handled 3,600,000 carloads of automobile freight. Of all rubber consumed in the United States, 85 per cent was used by the automobile industry. Likewise 60 per cent of all plate glass produced, 12 per cent of the copper and 15 per cent of the iron and steel were consumed by the automobile industry, and 80 per cent of the gasoline production was used by motor vehicles. The latter amounted to 10,860,000,000 gallons and motor oil consumption to 434,000,000 gallons. The crude rubber used by the American motor industry in 1928 was 814,000,000 pounds and for tires the cotton fabric used was 299,500,000 pounds.

The 3,120,000 motor trucks in use were in the hands of some 2,271,000 owners indicating what a part was played in transportation of goods by this agency. Fifty-nine railroads were using trucks as part of their shipping service. The growing use of motor busses for passenger transportation, both short and long haul, was striking. In 1928 their registration had reached 92,000. Busses were taking an important place in extending the advantages of better education in the rural communities as shown by the fact that 14,850 consolidated schools were using them. In extending their services to points not reached by rails, 365 street railways were using 9900 motor busses; 67 steam railroads were using 1250. For competition with railways, see RAILWAYS.

By far the most spectacular progress in the automobile industry in recent years was shown in the increased participation in foreign markets. In 1928, including United States exports and the Canadian output, which was entirely of United States models, the number of motor vehicles sold outside of the United States was 810,000. This was 17.5 per cent of the total produced and an increase in foreign sales over 1927 of 26 per cent. Exclusive of Canadian production and foreign assemblies of motor vehicles of United States design, exports of motor vehicles from the United States had more than doubled in the past four years. The value of motor vehicles, parts, and tires sold outside of the United States in 1928 was \$680,600,000. Compared to exportation, importation was in-

significant, the number of foreign motor vehicles purchased in the United States being only 520.

What the motor-vehicle retail business amounted to in numbers of units is strikingly indicated by the following figures: The total number of car and truck dealers as nearly as it could be determined was 53,700. The public garages numbered 51,600. Service stations and repair shops totaled 95,400, and supply stores, 79,100. The gasoline business was a considerable factor in itself, the number of gasoline filling stations being estimated to be 317,000 and the number of gasoline pumps in use 604,000.

LEGISLATION. Some quite important developments occurred during the year in the matter of legislation as related to the use of vehicles. Most significant of these was the completion of a Model Municipal Traffic Ordinance by the National Conference on Street and Highway Safety in which ten associations vitally interested coöperated with the Department of Commerce at the instance of Secretary Hoover. This supplemented the Uniform Vehicle Code proposed by the same body two years before and recommended for adoption by State legislatures. More rapid adoption of the uniform code was anticipated in 1929 when 43 State legislatures would be in session. Both were aimed to correct the inconvenience and even danger arising out of the present variation in State laws and city regulations that were so confusing to drivers of automobile traveling from one State into another. See **ROADS AND PAVEMENTS**.

The unfavorable experience of Massachusetts with a compulsory liability insurance law did much to turn the tide of sentiment against such legislation. Dealers and automobile clubs were opposing it and it was improbable that complete compulsory liability insurance would be enacted into law by other States. Drivers' license laws, one of the strong features of the Uniform Vehicle Code, were growing in favor as being in the interest of safety and several States were likely to adopt them. See also **INSURANCE**.

Especially interesting was the change of front on the part of law-makers on the question of speed regulation. Several States had raised their speed limits apparently becoming more concerned over those who drive too slow than over those who drive too fast, because of increasing difficulty in coping with congestion on their highways. Four-wheel brakes with their quicker stopping ability were coming so generally into use that it was held that faster speeds were permissible with no sacrifice of safety. The same influence, desire to increase highway capacity as well as to preserve the roads, was having its bearing on the requirement of pneumatic instead of solid tires on heavy duty trucks. This was being voluntarily accomplished so rapidly that it was felt laws need not be urged.

In the field of Federal legislation considerable thought and discussion were given to some equitable way to regulate busses operating in interstate commerce. Several bills were before the last 1928 session of Congress, but as there was no general agreement among interested parties as to what should be the character of such legislation no definite action was taken.

AZERBAIJAN, a'zër-bi-jan'. A new state constituted in 1918, consisting chiefly of the two former Russian provinces of Baku and Yelisavetpol; bounded on the east by the Caspian Sea, on the west by Georgia and Armenia, on the south by Persia, and on the north by Georgia, Northern Caucasus, and Daghestan. The official name of the state is the Azerbaijan Socialist Soviet Republic. Area, about 32,950 square miles and the population, according to official Russian figures, in 1926, 2,313,172 of whom 75 per cent are Moslem. Baku, the centre of the petroleum industry, is the capital and has a population of approximately 447,000. In 1925-26, 134,855 pupils attended primary and secondary schools. There were also trade-technical schools; teachers' training centres, higher educational institutions, and workers' faculties. The oil industry, in 1926-27, had an estimated production of 625,500,000 poods. After the outbreak of the Russian Revolution in 1917, Azerbaijan, Armenia, and Georgia formed a federation, but this broke up after a few weeks, when the three constituent elements each declared its independence. Two months after the *de facto* independence of Azerbaijan was recognized by Great Britain in 1920, the Bolsheviks overthrew the government and thenceforth the government was under Soviet control.

BADEN, bā'den. A constituent state of the German Republic, with a republican form of government since Nov. 22, 1918; formerly a grand duchy in the German Empire; bounded by Bavaria on the east and Alsace-Lorraine and the Palatinate on the west. Area, 5819 square miles; population in 1925, 2,312,462, as compared with 2,195,580 in 1919. Capital, Karlsruhe, with 145,694 inhabitants in 1925. The largest city is Mannheim with 247,486 inhabitants in 1925. Of the total population of the state in 1925, 1,115,477 were males and 1,196,985 females. The majority of the population is Roman Catholic. Education is free, general, and compulsory, the schools being under the jurisdiction of the state. For higher education there are universities at Heidelberg and Freiburg. In 1926 the total area under cultivation was 2,098,142 acres. Among the agricultural products, oats, rye, barley, wheat, potatoes, and vegetables are the most important. In 1925, 30,755 acres were planted to the vine and the yield of wine was 6,488,232 gallons. In 1927, 12,522 acres were under tobacco. In 1926 there were 622,324 cattle, 486,601 pigs, 44,836 sheep, 149,367 goats, 69,459 horses. The budget for 1928 and 1929 fixed the ordinary revenue at 275,800,000 gold marks and the ordinary expenditure at 281,200,000 gold marks.

The present constitution dates from Mar. 21, 1919, and vests the executive power in a cabinet comprising the state president, five ministers, and three state councilors without portfolios, all of whom are elected by the legislature. Legislative power resides in a single chamber body known as the Landtag. The constitution abolishes all privileges of birth and religion and under it women are endowed with the same rights as the men, being eligible to all public offices. There is universal suffrage for all persons of either sex over 20 years of age. The initiative, referendum, and proportional representation have been introduced. The Landtag elected on Oct. 25, 1925, for the term ending Oct. 25, 1929, had 72 members distributed among the several parties at the beginning of 1927 as follows: Centre, 28; Socialists, 16; German Democratic party,

6; Right, 9; German People's party, 7; Communists, 4; Economic Union, 2. State President at the beginning of 1928, G. Trunk, who also held the post of Minister of Justice. Dr. F. J. Schmitt was Minister of Finance, A. Remmele, Minister of the Interior, and O. Leers, Minister of Religion and Education.

BAGDAD. See **ARCHÆOLOGY**.

BAHAMAS. A group of islands, north of the British West Indies, off the southeast coast of Florida, 29 in number, of which 20 are inhabited. They also include 661 keys and over 3000 reefs. The islands, which are of coral formation, have an area of 4404 square miles and a population, according to the census of 1921, of 53,031. The estimated population on Jan. 1, 1927, was 58,101. The important islands with their populations in 1921, are as follows: New Providence, containing the capital, Nassau, 12,975; Andros, 6976; Eleuthera, 6048; Long Island, 4659; Abaco, 3993; Exuma, 3730; San Salvador, 4273. Elementary instruction is compulsory from the ages of 6 to 14. For the calendar year 1926, the exports totaled £406,271, and the imports, £2,059,755. The principal exports were sisal, sponge, lumber, tomatoes, shells, and preserved pineapples; principal imports, foodstuffs, spirits, raw materials, and manufactured articles. In 1925-26 the revenue was £502,216 and the expenditure, £374,176. The public debt in 1926 was £151,123. Ship entries in 1926, 1159 vessels of 539,786 tons: clearances, 984 vessels of 528,559 tons. The islands are administered by a governor who is assisted by an executive council and a legislative council, each of nine members and a legislative assembly of 29 members, the franchise being based on a small property qualification. Governor and Commander-in-chief in 1928, Maj. Charles William Orr.

BAKHMETEFF, bāk'mēt'ef, GEORGE S. Former Ambassador of Russia to the United States, died at Paris on August 29. His first diplomatic post was that of an attaché in London. Later he served as secretary in Paris, Athens, and Washington. He distinguished himself while an envoy to Bulgaria, by dissuading King Ferdinand from attacking the Turks in Macedonia. In 1905 he was sent to Japan and succeeded in alleviating the hostility aroused by the Russo-Japanese War. That accomplished, the popular Ambassador returned to Washington in 1911, where he remained until 1917, when he resigned his last official post in consequence of the Revolution.

BAKU. See **AZERBAIJAN**.

BALDWIN, BIRD THOMAS. American psychologist and educator, died at Iowa City, Iowa, May 12, at the age of fifty-three. He was born at Marshallton, Pa., and studied at the University of Pennsylvania, Harvard University, and the University of Leipzig. After holding positions in pedagogy and psychology at various institutions, he became lecturer in educational psychology at Johns Hopkins University, Baltimore, Md., 1916-17, and research professor in educational psychology and director of the Iowa Child Welfare Research Station, State University of Iowa, in 1917. He was a major in the Sanitary Corps, U. S. A., 1918-19, and later chief psychologist and director of the rehabilitation of disabled soldiers at the Walter Reed General Hospital, Washington, D. C. He wrote: *Physical Growth and School Progress*; *Physical Growth from Birth to Maturity*; *The Mental Growth Curve of Normal and Superior Children*; *The Psychol-*

ogy of the Pre-school Child, besides many articles, bulletins, and reviews on educational and psychological topics.

BALKAN STATES. The collective term applied to those states which make up the Balkan peninsula in southeastern Europe north and west of the Aegean Sea. See ALBANIA, BULGARIA, GREECE, JUGO-SLAVIA, RUMANIA, and TURKEY.

BALTIMORE. For restoration of Fort McHenry, see CELEBRATIONS.

BALTZELL, WINTON JAMES. American writer on music and editor, died at New York, January 10. He was born at Shiremanstown, Pa., Dec. 18, 1864, and was educated at Lebanon Valley College, the New England Conservatory of Music, and the Music School of the University of Pennsylvania. From 1890 to 1897 he taught at Reading, Pa., and in the latter year became editor of *The Etude*. In 1899-1900 he taught the history and theory of music at Ohio Wesleyan University, and then returned to *The Etude*, until 1907. He was editor of *The Musician*, 1907-19, and secretary of the National Academy of Music from 1919. He wrote: *A Complete History of Music* (1905); *Baltzell's Dictionary of Musicians* (1911), and textbooks on the theory and history of music.

BANG, MRS. NINA. Danish stateswoman, died March 25. She was born at Copenhagen, Denmark, in October, 1866. She obtained a degree in history in 1894. She was a student of economics, and wrote much on that subject. In political belief Mrs. Bang was a Socialist. From 1913 to 1917 she was a member of the Copenhagen city council, and in 1918 she was elected to the Landsting, the upper house of the Danish Legislature. In 1924 she became the first woman member of a Danish cabinet, as minister of education, and she held the portfolio until 1926. She attracted international attention by her determined opposition to the Danish national anthem, declaring that it was too warlike.

BANKERS' ASSOCIATION, AMERICAN. The dominant national organization of banks in the United States. It has a membership of over 20,000 banks, out of a total of 27,000 in the country, and comprises among its members, it is estimated, in excess of 90 per cent of the nation's aggregate banking capital funds of \$8,000,000,000 and total resources of \$69,000,000,000. The association has four major divisions, each devoted to the special interests, technical advancement, and general welfare of the respective classes of banks indicated in their titles, as follows: The National Bank Division; the Savings Bank Division; the State Bank Division; and the Trust Company Division. Within the organization there are also three sections devoted to general inter-bank interests as follows: The American Institute of Banking Section, which is the educational arm of the organization, with an enrollment of 38,000 students from banks in all parts of the country and a general membership of 63,000; the Clearing House Section, which promotes the organization of city and county bank groups for the purpose of facilitating business transactions and common welfare through clearing houses, clearing-house examiner systems, and mutual credit bureaus; and the State Secretaries Section, which forms a link between the national organization and the State. There is also a Protective Department which prosecutes continually a country-wide campaign of prevention, protection, and investigation for all member banks,

in respect to criminal operations against banks. The association conducts a legal department, which keeps bankers informed on developments in the field of banking law and watches the interests of banking and the public in both State and National legislation, in connection with the association's State and Federal legislative committees and councils, which seek to present the best banking viewpoints to the legislators.

During 1928 the organization gave special attention to maintaining equitable bank taxation and to the modernization of such taxation, and continued its extensive research into the causes of bank failures which resulted in the application of the finding that the remedy lay in larger minimum capital for banks, the granting of charters only where there was a real need for increased banking facilities, more drastic State supervision of banks, and the organization of group bank associations for mutual help.

The American Bankers' Association Educational Foundation completed its campaign in 1927 to raise a fund of \$500,000 to be employed in the furtherance of scholarships and research in banking and finance in college, and in 1928 allocated 167 loan scholarships in annual units of \$250 to students in colleges throughout the country. In addition, the Education Commission conducted lectures on banking and business in schools and civic clubs throughout the country.

Each autumn the association holds its annual convention, which draws up a statement of the organization's policies, and in the spring the executive council holds its meeting. The latter group is a representative body proportioned to the membership in all States and is qualified to take action upon certain association matters. The continuing activities of the association are carried on by a permanent staff, functioning in the national headquarters of the organization at 110 East 42nd Street, New York City, under the direction of the executive manager, Fred N. Shepherd. There is also an Administrative Committee, composed of 15 members including the national officers, heads of the various divisions and sections, and certain others, which stands as the ad interim governing authority between meetings of the convention and the executive council.

The problems which engaged the attention of the A. B. A. at its fifty-fourth annual convention which opened at Philadelphia on Oct. 1, 1928, were the credit situation, farm relief, proposed bank-tax legislation, the new system of small salary loans, crime, and, of special interest, the new regional clearing houses that have been evolved as a check on bank failures. The officers elected for 1928-29 were: Craig B. Hazelwood, Vice President Union Trust Company, Chicago, Ill., as president; John G. Lonsdale, President National Bank of Commerce, St. Louis, Mo., first vice president; Rome C. Stephenson, Vice President St. Joseph County Savings Bank, South Bend, Ind., second vice president; and W. D. Longyear, Vice President Security Trust & Savings Bank, Los Angeles, Calif., treasurer.

BANKS AND BANKING. As during the year 1927, credit expansion continued to be the dominating feature in the banking field, the year 1928 thus maintained the upward movement which had already gained such headway and in some quarters greatly exaggerated and developed it. There was an increase all around in the operations of the banks of every class,

and while there appeared to be a decidedly better solvency situation, as shown by a decline in the number of failures, fundamental alteration in asset conditions was such as to afford strong grounds for the belief that the banking system as a whole was decidedly weaker in so far as liquidity and general soundness was concerned, at the end of the year, than it was at the beginning. Nevertheless, the year was profitable and successful, from the earnings standpoint, while the great movement in value of bank stocks, although temporarily checked and suspended during the middle part of the year, was substantially maintained, recovering lost ground as the year drew to a close.

NATIONAL BANKS. The national banking system continued to show growth in assets but not in numbers, there being 7707 associations in existence at the close of the report year, or 125 less than a year earlier (Oct. 31, 1927). The aggregate resources of the banks were \$1,711,656,000, or a growth of about 6.3 per cent. Falling off in number was due to consolidations and retirements, accompanied by some failures, while it is probable that greater care than formerly was used in passing upon applications to organize new banks. Failures fell off about 60 per cent from the preceding year, there being 54 as compared with 135 in 1927. No new legislation of importance was enacted, but the development of the system continued under the National Bank Act as amended by the so-called McFadden Act of Feb. 25, 1927. Perhaps the most striking development of the year was seen in connection with the growth of the number of banks authorized to undertake trust company functions, this number being undoubtedly stimulated in its expansion as the result of the legislation of 1927. Prior to that year only 101 national banks had included the word "trust" in their titles, whereas since that time the number has gone to 236, and the total amount of trust assets held in National Bank Trust departments at the end of the year was about \$3,300,000,000.

Brief analysis of the condition of national banks is furnished by the accompanying table in which the chief assets and liabilities of the system are contrasted for a series of dates. From this showing the continuous growth of the operations of the system can be noted, and the expansion of deposits and of lending operations stands out conspicuously. For the report year 1928, the average dividend of national banks

(measured by capital and surplus) was approximately 7 per cent, and the total net addition to profits was \$270,158,000, or about \$18,000,000 more than for the preceding year.

FEDERAL RESERVE MEMBERS. The position of Federal Reserve member banks includes, as is well known, the facts as to a body of banks and trust companies which comprise not only the national banks themselves, but also about 1300 institutions organized under State charter. Inasmuch as this group of banks includes a large

ASSETS AND LIABILITIES OF 624 REPORTING MEMBER BANKS, TOGETHER WITH CHANGES DURING THE YEAR ENDED JANUARY 2, 1929

[In thousands, 000 omitted]

	Jan. 2, 1929	Increase or decrease during year

^a December 26 figures, revised.

fraction of the entire body of assets of commercial banks, it affords a rather better reflection of actual changes in bank credit than can be obtained from the national figures alone. The weekly report obtained by the Federal Reserve Board from about 624 representative members, situated in 100 cities and probably including from 45 to 50 per cent of the entire assets of the banks of the country, is shown in the accompanying statement which illustrates their position as compared with the corresponding situation of a year previously.

CHANGES IN NATIONAL BANK POSITION

^a Includes rediscounts and customers' liability under letters of credit.

Great increase in operations, and particularly in loans and discounts, is exhibited by this statement, the enlargement amounting to \$1,331,000,000 while the increase in deposits was \$218,000,000. As the end of the year approached, banks of all classes became very fully "loaned up," and more than ever dependent upon Federal Reserve banks, with the result that increases in credit extension were very promptly paralleled by corresponding increases (in due proportion) in the loan accounts of Federal Reserve banks.

The position of State banks and trust companies ran substantially parallel to that of national banks during the year. In the annual compilation made by the comptroller of the currency as of June 30, 1928, demand deposits of 18,522 State banks and trust companies, savings banks and private banks, totaled \$13,302,856,000; and time deposits of the same group, \$20,241,471,000. Savings deposits in mutual savings banks were \$8,665,592,000 and in stock savings banks, \$1,338,011,000. The grand total of deposits of all classes was given as \$33,944,265,000, while national banks reported \$19,300,433,000, an aggregate of \$53,244,698,000.

A review of the statement shows the continuation of the same general tendencies that have been at work in recent years, and the progressive enlargement of business on the part of the several classes of non-national institutions. As already noted, the larger of these non-national institutions are included in the statement of member banks of the Federal Reserve System.

FEDERAL RESERVE BANKS. Federal Reserve banks during the year 1928 definitely felt the impetus of the great expansion of credit that was occurring and exhibited the effects of it as never before. They already lost severely in gold during the latter part of 1927 and this loss continued during the early months of 1928, being shown in a greatly reduced gold reserve. The accompanying statement presents this loss as \$155,000,000, but the real amount was considerably greater, being masked by the process of "ear-marking."

Other changes in the principal items involved an unusually large increase in the total amount of credit extended, this being raised to the highest figure for a good many years past, as reflected in the item, total bills discounted, which showed a figure of \$1,151,464,000 and an increase of \$630,000,000. The character of these changes threw light upon the general alterations which were occurring in the member banks. The latter having become greatly expanded and loaned up, found it necessary to resort to Reserve banks in order to get relief whenever they found that the pressure upon them from their customers was too hard to bear. Accordingly practically every increase in member-bank credit would be reflected in a corresponding increase in Reserve-bank credit, the outcome thus being to develop a parallel state of inflation as the year proceeded.

Reserve banks had opened the year with a discount rate of $3\frac{1}{2}$ per cent, raised it pretty generally to $4\frac{1}{2}$ per cent at the beginning of February, while the eastern banks at the opening of summer undertook another advance to 5 per cent. There was general opinion that the rate was too low and a large party in the Federal Reserve System was anxious to bring about an increase to a still higher level. The effort,

however, being unsuccessful, changes in the personnel of the system occurring during the year tended on the whole to impair the continuity of policy which might otherwise have been expected, and the general feeling during the latter part of the autumn was that the system was drifting without very definite leadership to direct it into the right channel.

BANK CREDIT. The survey already made indicates the broader tendencies of bank credit during the year 1928, but a few special phases call

for particular mention. Of these the most interesting is the great expansion of what are called brokers' loans. These are recapitulated by the New York Stock Exchange for the year as follows, the increase shown between January and December being thus approximately \$2,000,000, 000 or about 50 per cent:

BROKERS' LOANS

1928	Demand	Time	Total
Jan. 31	\$3,392,873,281	\$1,027,479,260	\$4,420,352,541
Feb. 29	3,294,378,654	1,028,200,260	4,322,578,914
Mar. 31	3,580,425,172	1,059,749,000	4,640,174,172
April 30	3,788,937,599	1,168,845,000	4,907,782,599
May 31	4,070,359,081	1,203,687,250	5,274,046,281
June 30	3,741,632,505	1,156,718,982	4,898,351,487
July 31	3,767,694,495	1,069,653,084	4,837,347,579
Aug. 31	4,093,889,293	957,548,112	5,051,437,405
Sept. 30	4,689,551,974	824,087,711	5,513,639,685
Oct. 31	5,115,727,534	763,993,528	5,879,721,062
Nov. 30	5,614,388,360	777,255,904	6,391,644,264
Dec. 31	5,722,258,724	717,481,787	6,439,740,511

The crude figures for brokers' loans thus given, do not set forth the entire details of an interesting development.* One conspicuous feature of the situation was the great increase of loans made for "account of others" under which head are included loans made by private corporations and by foreign banks. From both sources great quantities of money came into the market, corporations finding it profitable to lend at 8 or 10 per cent the money which they had obtained from the public on their own obligations at 5 or 6 per cent. Anxiety about the brokers' loan account persisted throughout the year, particularly because of the very large number of persons who were involved in the market, and because also of the more and more frozen character of bank portfolios. Generally speaking, banks tended more and more to put their funds into the stock market and to let their portfolios assume a rather non-liquid position. From this point of view the close of the year represented a state of things which was generally viewed as rather bad, with symptoms of still further deterioration.

BANK FAILURES. The bank-failure epidemic which had shown signs of slackening during the latter part of 1927 continued to lose ground during the year 1928 and as a result total failures for the year were only about 491 or a little more than half the number for 1927. The accompanying brief table furnishes the compilation of the results as compiled by the Federal Reserve System for the year, and shows marked improvement not only in number but in volume of assets affected.

Nevertheless the continued existence of so many bank failures was regarded as an extremely undesirable phase of the banking situation. It apparently was not due to any general improvement in banking methods that curtailment of failures occurred, but rather to the subsidence of agricultural difficulties and the existence of distinctly more prosperous conditions the country over. The remedies suggested by the American Bankers' Association a year earlier for correcting tendencies to failure among banks were not acted upon, but with the decline of the failure epidemic itself, general interest in the evil as a matter calling for real and immediate correction seemed to fall off, and by the end of the year a rather disappointing attitude of indifference on the whole subject was to be noted, not only among bankers but on the part of the general public as well.

BRANCH BANKING. The subject of branch banking which had been so urgent a matter of controversy for a year or two received relatively little attention during 1928, largely due to the fact that through the process of amalgamation the larger banks were finding it possible to obtain about all the branch accommodations that they needed. During the year the comptroller of the currency authorized the establishment of 103 new city branches, but at the same time 42 already authorized were discontinued, leaving a total of 188 in all organized and still existing under the Act of Feb. 25, 1927. Conversion of State banks, and consolidation of State banks with national banks added seventy new branches, but thirty-eight were lost by liquidation of banks or otherwise. The total in operation under the national system at the close of the year was in the neighborhood of 1000. Progress in branch banking among the several States largely took the form of the development of chain banking although in a few States regularly organized branches continued to be added. However, the attitude of the Federal Reserve System tended to slow down progress of legitimate branch organization among member institutions. The whole question remained about as unsettled at the close of the year as it was at the beginning.

INTERNATIONAL RELATIONS. Progress in international relations during the year was substantial owing to the fact that a much more highly stabilized condition of foreign currencies had been attained. This made it possible to use the facilities extended by foreign banks much more freely than could otherwise have been thought of. The balances of foreign banks in the United States continued very large, notwithstanding that they were used for the purpose of effecting a heavy exportation of gold amounting to about \$500,000,000 between June 30, 1927, and June 30, 1928. It was not necessary to buy

as liberally abroad in the foreign bill market as had been the practice of Federal Reserve Banks during the preceding year, Federal Reserve banks continued the practice of earmarking gold for foreign account, the United States becoming gradually a base upon which a good many of the stabilized currencies of the United States rested by reason of the establishment of what was practically a gold exchange standard between them and the New York market. Foreign countries moreover began to endeavor to develop a condition of greater independence in home matters and to attempt the restriction of borrowing even by private citizens in the American market where possible.

CONDITIONS AT CLOSE OF YEAR. Banking problems at the close of the year were chiefly concerned with the probable results of the over-expanded condition of domestic credit, on account of the undue drafts made by the Stock Exchange upon the banking funds of the country. The possibility of reaction in some serious form had grown more intense during the course of the year. The gold movement out of the country which had caused substantial anxiety up to July 1st, had been largely checked, but its renewal at any moment with correspondingly bad effects upon the maintenance of sound credit conditions in the United States was feared as a decided possibility. It was generally felt by business and financial authorities that there was much ground for anticipating unfavorable banking and credit developments during 1929 and that these could be averted only by the exercise of genuine skill. This left the banking credit situation as practically the only seriously discouraging feature of the industrial and financial outlook at the beginning of the New Year. See also articles, *BUSINESS REVIEW*; *FINANCIAL REVIEW*.

BAPTISTS. In 1928 there were in the United States 14 bodies comprising that branch of the Christian Church known as Baptists, which numerically constituted the second largest Protestant group. While the Baptists trace their origin to the Protestant Reformation in the sixteenth century and churches were found in that period in Germany and Switzerland, the first Calvinistic Baptist Church was formed in London in 1638 and the First Baptist Church in America was probably established by Roger Williams in Providence, R. I., in 1639, although this honor is disputed by the First Baptist Church of Newport, R. I., organized the same year or shortly after. As a result of political differences, and particularly on account of the question of slavery prior to the Civil War, the Southern Baptists withdrew from the national organization in 1845, forming the Southern Baptist Convention which, since that time, has functioned not as a new denomination, but as an organization for the purpose of directing missionary and general evangelistic work in the churches of the Southern States. A National Baptist Convention representing the Negro churches was also formed. In addition to the main body, other divisions early began to appear. These were known as "Primitive," "United," "General," "Free," etc. In its polity the church is congregational, each church being sovereign as to its own discipline and worship. Applicants for the ministry are licensed to preach by the church in which they hold membership.

Statistics prepared by the *American Baptist Year Book* in 1928 showed in the United States a total of 55,584 churches in 1927, with 49,454 ordained ministers; 2,135 local associations; and 341,585 baptisms during the year, making a membership of 8,685,881. Sunday schools numbered 46,966 with an enrollment of 5,396,439. Church property was valued at \$451,758,600, and contributions amounted to \$74,644,005, of which \$60,481,118 was for current expenses and \$14,162,887 for beneficences. These figures were divided among the three main groups of the denomination as follows: The Northern Baptist Convention, composed of 37 conventions in 35 States reported 8338 churches; 428 associations; 8850 ministers; 66,640 baptisms during the year; 1,419,883 church members; 7217 Sunday schools with a membership of 1,141,720; and contributions amounting to \$31,544,284. The Southern Baptist Convention consisted of 18 State conventions and had 25,561 churches; 980 associations; 22,899 ministers; 3,765,001 members, of whom 202,420 were baptized during the year; 22,187 Sunday schools, with 2,821,079 members; and contributions of \$40,040,843. There were 30 Negro Baptist Conventions with 21,712 churches; 728 associations; 17,743 ministers; 3,515,542 church members, 73,059 of whom were additions by baptism; 1,448,259 Sunday-school scholars in 17,592 schools; and \$3,537,999 in contributions. Could statistics have been adequately and correctly reported, they would have revealed a Negro Baptist constituency approximating 5,000,000.

In the Dominion of Canada there were three conventions; churches numbered 1286; ministers 824; members 143,106, of whom 5452 were additions by baptism, 1221 Sunday schools, and 113,214 scholars; and contributions amounted to \$2,858,645. There were also reported 95 churches in Mexico, with 50 ministers and 6147 members.

The denomination maintained in the United States and Canada 235 educational institutions, which in 1928 had 84,456 students, 5277 instructors, property aggregating \$122,268,300, endowments valued at \$126,624,879, and an annual income for the year of \$30,628,888.

Of these institutions, the Northern Baptists maintained 60, the Southern Baptists 114, the Colored Baptists 56, and 7 were in the Dominion of Canada. There were 36 orphanages, 30 homes and 34 hospitals under the direction of the denomination. Large staffs of workers were engaged in home missions and in foreign missions in the West Indies, Central America, South America, India, Burma, China, Japan, Africa, the Philippines, and European countries.

In addition to several unorganized groups of foreign-speaking Baptists in North America, there were the following organized bodies which held their own conferences; German-, Swedish-, French-speaking Baptists of New England, Finnish Baptist Mission Union, American Magyar (Hungarian), Italian, Danish, Norwegian, Czechoslovak, Polish, Rumanian, Portuguese, and Russian-Ukrainian Conferences. Spanish-speaking (Mexican) Baptists are well organized in some sections, North and South; and there are unorganized bodies of Chinese and Japanese Baptists. Statistics for these bodies in 1928 were as follows: Churches, 944; ministers, 749; baptisms, 4708; membership, 89,968; Bible schools, 891;

Bible-school enrollment, 88,714; property valuation, \$12,104,500; and contributions, \$2,702,836.

Smaller branches of the denomination, differing in various respects from the main branches of the church, include the following: Six-Principle Baptists (the International Old Baptist Union), Seventh-Day Baptists, Free Will Baptists, Colored Free Will Baptists, Free Will Baptists (Bullockites), General Baptists, Separate Baptists, Regular Baptists, United Baptists, Duck River Primitive Baptists (Progressive), Scandinavian Independent Baptists, and Two-Seed-In-The-Spirit Predestinarian Baptists. See also BAPTISTS, FREE.

The denomination maintains several publishing houses, of which the most important is the American Baptist Publication Society in Philadelphia. The official periodical of the Northern Baptist Convention is *The Baptist* (Chicago); of the National Baptist Convention, the *National Baptist Voice* (Nashville); while many sectional publications represent the Southern Baptist Convention.

The Baptist World Alliance was organized in 1905 and meets every five years; the last meeting was held in July, 1928, in Toronto, Canada. Its relationship to the Baptist churches is purely advisory and its purpose is discussion of interests common to the denomination. The *British Hand Book* for 1928 prepared the following statistics of the denomination in 1927:

	<i>Churches</i>	<i>Ministers</i>	<i>Members</i>
America	57,342	45,135	8,587,498
Europe	8,213	4,735	1,636,342
Asia	3,158	1,816	343,036
Africa	1,092	338	72,102
Australasia	460	369	33,534
Total	70,265	52,393	10,672,512

BAPTISTS, FREE. A branch of the Baptist denomination, which by 1928 had practically completed its policy of merging with the Northern Baptist Convention. There was but little independent activity of the Free Baptists, yet the General Conference of the Free Baptists, the national incorporated organization, still preserved its legal existence and powers. Estates in which life interests terminated or other entailments were removed, were still coming to its treasury. The majority of Free Baptist ministers, churches and members were included in the enumeration of the Northern Baptist Convention. Alfred Williams Anthony was serving as corresponding secretary and treasurer. See BAPTISTS.

BAR ASSOCIATION, AMERICAN. A national association organized in 1878 to advance the science of jurisprudence, the administration of justice, harmony in legislation, and the observance of legal precedents throughout the United States, as well as to uphold the legal profession and promote good understanding among its members. The fifty-first annual meeting, which was also the Semi-Centennial Meeting of the Association, held at Seattle, Wash., July 25-27, 1928, was attended by 2000 delegates. The retiring president, Silas H. Strawn, of Chicago, in his opening address, "Fifty Years Progress in Law," called attention to the more important changes in substantive law during that period; reviewed the history of the *Sixteenth*, *Seventeenth*, *Eighteenth*, and *Nineteenth Amendments*; discussed the *Child Labor Case* (247 U. S. 251); dwelt

upon transportation problems and legislation respecting the radio, advocating, in the latter case, that regulatory powers affecting the radio should be vested in the Secretary of Commerce, rather than in a separate commission; and, among other subjects, referred to *Workmen's Compensation*, *Anti-Trust Legislation*, the *Clayton Act*, the *Federal Trade Commission*, *Business Corporations*, *Investment Trusts*, *Causes of Crime and Law Enforcement* and the attitude of the people as a remedy, *Legal Education*, the *Federal Reserve System*, and the *McFadden-Pepper Bill*.

At the Seattle meeting, the Hon. Harlan F. Stone, Associate Justice of the United States Supreme Court, delivered an address on "Fifty Years' Work of the United States Supreme Court," in which he pointed out that the great industrial and commercial expansion following upon the Civil War had furnished most of the important questions before the Supreme Court out of which had come the significant developments in constitutional and private law during that period. The Hon. Hugh Kennedy addressed the convention on "Character and Sources of the Constitution of the Irish Free State," and F. M. Jewett, vice president of the American Telephone and Telegraph Co., spoke on "Fifty Years of Science and Engineering," while Dr. John H. Finley, former president of New York University and editor of the *New York Times*, chose as the topic of his address, "Fifty Years of Progress in Education." An interesting feature of the meeting was the presentation of an entertainment entitled, "Magna Charta Pageant-Drama."

The convention went on record as approving an Act to promote Conservation of Petroleum and Natural Gas, etc.; declined to approve H. R. 9586, a bill to amend the copyright law so as to permit adhesion of the United States to the International Copyright Union; instructed the Committee on Jurisprudence and Law Reform to oppose the Norris Bill and any other bill attempting to diminish jurisdiction of the Federal Courts as defined by Section 24 of the Judicial Code; and passed various other resolutions and recommendations. Reports of committees adopted without opposition were those of air law, American citizenship, jurisprudence and law reform, commerce, commercial law and bankruptcy, international law, professional ethics and grievances, uniform judicial procedure, change of date of the presidential inauguration, legal aid, and insurance. The executive committee selected Memphis, Tenn., as the place for holding the 1929 meeting of the association. Officers elected at the meeting were Gurney E. Newlin, of Los Angeles, Calif., president; John H. Voorhees, of Sioux Falls, S. Dak., reelected treasurer; William P. McCracken, of Chicago, reelected secretary. During the year, a marble statue of Sir William Blackstone, a gift of the American Bar Association to the Bar of England in 1924, was placed in position in the Central Hall of the Law Courts in London, in recognition of the influence of the great English commentator on American jurisprudence. The headquarters of the association are Room 1119, 209 S. LaSalle Street, Chicago. See CRIME: LABOR ARBITRATION AND CONCILIATION.

BAR-BADOS. An island colony of Great Britain, lying to the east of the Windward Islands; the most easterly of the Caribbean Islands. The area is 166 square miles and the population, according to the census of 1921, 156,312; esti-

mated, Dec. 21, 1926, 169,885. The capital and chief city is Bridgetown, with a population of 13,486. In 1926 the average attendance in the elementary schools was 14,610 out of an enrollment of 22,595. In 1926 there were 5148 births and 4869 deaths. The figures in pounds sterling for revenue, expenditure, imports and exports, and public debt for 1926-27 were as follows:

Revenue	£387,462
Expenditure	410,585
Imports	2,155,167
Exports	1,287,161
Public debt	591,000

The principal imports were cotton manufactures, manures, flour, dried fish, machinery, salt beef and pork, and rice. The principal exports were sugar, molasses, raw cotton, and rum. The administration is under a governor assisted by an executive council, an executive committee, a legislative council of nine members appointed by the King, and an assembly of 24 members elected annually by the people. Governor in 1928, W. C. F. Robertson.

BARBERRY PLANTS. See BOTANY, under *Plant Diseases*.

BARCELONA INTERNATIONAL EXPOSITION. See EXPOSITIONS.

BARLEY. The barley production in 1928 of 33 countries reporting to the International Institute of Agriculture, Rome, was estimated at 1,631,700,000 bushels, an increase of 17.3 per cent above the yield of 1927 and of 25 per cent above the average for the five years 1922-26. The acreage in these countries was 69,865,000, which was 10.3 per cent above the acreage of 1927 and 13.5 per cent above that of the five-year average. The production of the leading barley-producing countries, not including the United States, was as follows: United Socialist Soviet Republics, 261,804,000 bushels; Canada, 144,875,000 bushels; Germany, 134,786,000 bushels; Poland, 89,053,000 bushels; Spain, 82,538,000 bushels; and Rumania, 75,620,000 bushels. Argentina in 1927-28 produced 14,560,000 bushels on 1,321,000 acres.

The United States in 1928, according to estimates by the Department of Agriculture, produced 356,868,000 bushels, or about one-third more than in 1927 when the yield was 265,882,000 bushels. The increase in production in 1928 was nearly 86 per cent over the average production for the five years 1922-26. The acreage for the years 1928 and 1927 was 12,539,000 and 9,476,000 acres, and the average yield per acre 28.5 and 28.1 bushels respectively. The average farm price on Dec. 1, 1928, was 55.2 cents per bushel or 12.6 cents below the corresponding price the year before. The total value at these prices of the crop of 1928 was \$197,128,000 and that of the crop of 1927, \$180,200,000.

The 1928 production of the leading barley-growing States among the thirty-five States reporting yields was as follows: Minnesota, 60,000,000 bushels; North Dakota, 55,564,000 bushels; South Dakota, 35,675,000 bushels; California, 31,842,000 bushels; Iowa, 27,068,000 bushels; Wisconsin, 26,898,000 bushels; Illinois, 20,060,000 bushels; Kansas, 17,661,000 bushels; Nebraska, 14,018,000 bushels; and Colorado, 13,128,000 bushels. All other States reported yields of less than 10,000,000 bushels. All of these States reported an increase in acreage over the preced-

ing year and the marked increase in area and yield due to the growing importance of barley as a feed crop occurred mainly in the North Central States. The average yield per acre ranged from 19 bushels in New Mexico to 49 bushels in Utah. Among the States mentioned above, Wisconsin ranked first with an average yield of 37.1 bushels per acre.

The average farm price per bushel on Dec. 1, 1928, ranged from 43 cents in North Dakota to \$1.10 in Maine, Vermont, and Tennessee and \$1.20 in North Carolina. In the fiscal year ended June 30, 1928, the United States exported 36,580,000 bushels of barley and 2,964,000 bushels of malt and imported 360,000 bushels of the grain.

BARNARD COLLEGE. See COLUMBIA UNIVERSITY.

BARRETT, THOMAS AUGUSTINE. See STUART, LESLIE.

BARRON, CLARENCE WALKER. American financial editor and publisher, died at Battle Creek, Mich., October 2. He was born at Boston, Mass., July 2, 1855, and was graduated from the English High School of that city in 1873. He took a position as reporter on the *Boston Daily News* in the year of his graduation, and, already equipped with shorthand, an unusual convenience with newspaper men of his day, he wrote, "Wendell Phillips on Finance," an article covering a debate between Phillips and William Lloyd Garrison, which served to popularize financial discussions. He joined the editorial staff of *The Boston Transcript* in 1875, being also financial reporter, and in 1887 he founded *The Boston News Bureau*, which supplied a budget of financial information, published in bulletin form at the end of the day. He later became president of the company, and he founded *The Philadelphia News Bureau*, a similar concern, in 1896. Moving to New York, Mr. Barron in 1901 purchased control of Dow, Jones & Company, a publishing house which operated electric page newspapers simultaneously in various cities and in the same year he bought *The Wall Street Journal*. He founded *Barron's, the National Financial Weekly* in 1921, and he was publisher of that paper, as well of his four earlier ventures at the time of his death, besides being president of *The Wall Street Journal Building Company*, and *Doremus & Company*, advertisers. He received the honorary D.Sc. degree from Boston University in 1927. Mr. Barron was also interested in farming and became one of the largest importers of Guernsey cattle in the United States, organizing the Oaks Farm and Creamery at Cohasset, Mass., in 1908. Mr. Barron not only entirely reorganized the disseminating of financial news, but he contributed many authoritative articles on finance to periodicals, and wrote several books, including: *The Federal Reserve Act* (1914); *The Audacious War* (1915); *The Mexican Problem* (1917); *War Finance* (1919); and *A World Remaking* (1920).

BARTHOLOMÉ, ALBERT. French sculptor and president of the Société Nationale des Beaux-Arts, died at Paris, October 31. He was born at Thiverval, Aug. 29, 1848, and, altering his original decision to become a lawyer, he studied painting under Menn in Geneva and Gérôme in Paris. He early acquired a reputation as an artist with his genre pictures. He

commenced to teach himself sculpture in 1876, and within a year had completed a memorial to his wife, which was placed in the churchyard of Boullant. His success was established by his monument *Aux Morts*, erected in 1895, at the entrance of the cemetery of Père-Lachaise. The statue exemplifies Bartholomé's greatest creation, the nude in an attitude of grief. Following the traditional or "classical" French school, he was recognized as one of the best sculptors of his time, receiving the *grand prix de sculpture* at the *exposition universelle* in 1900. He was, however, not responsive to the changes of an impressionistic nature which brought about such sculptors as Rodin. The French Government made him a commander of the Legion of Honor, and Belgium named him Grand-officier de l'Ordre de Léopold. He also was awarded the grand-croix d'Isabelle-la-Catholique by Spain, and made a grand-officer of the Sacred Treasure by Japan. He was elected to the Royal Academies of England, Scotland, Belgium, and Spain, and was president of the Société Nationale des Beaux-Arts. He designed the French Croix de Guerre. One of the most famous of his many memorials is *Paris, 1914-1918*, at the Place de Carrousel, by the Louvre. Others are dedicated to Meilhac, and to M. Pain at the Montmartre Cemetery; to Jean Jacques Rousseau at the Panthéon; to the family of Princess Gabri-machi at Bucharest; to Engel at Chênais-Belfort; to M. Schoen at Montlignon, and to Sénateur Raymond at Montbrison; to Honoré Champion at the Montparnasse Cemetery; to Charles Giron at Genthod-Genève; to jeune de Laumont at Goux-Arras; to *auteurs et compositeurs dramatiques* at 12, rue Henner, Paris; to *avocats*, and to *magistrats morts au champ d'honneur* at the Palais de Justice, Paris; and to *morts pour la patrie* at Creusot. Much of Bartholomé's less serious work was purchased by museums throughout Europe. Those best known are *Portrait de Mme. Bartholomé* in the Luxembourg; *Jeune Fille se Coiffant* in Dresden; *L'adieu* in Brussels; *Femme Sortant du Bain*, Vienna; *Baigneuse* at Aix-la-Chapelle; *Petite Fille en Pleurs* in Copenhagen; *L'union dans l'au Dela* at Rome; and *Baigneuse* at Rheims. He is also represented at Marseilles, Edinburgh, and Santiago.

BASEBALL. The New York American League Baseball Club, familiarly known as the Yankees, in 1928 for the second year in succession dominated professional baseball. Following their successful defense of the league pennant, the Yankees broke all records by overcoming the St. Louis Cardinals, flag winners of the National League, in four straight world-series games. In the previous year they had attained world championship honors through four consecutive victories over the Pittsburgh Pirates. No other team in baseball history had ever succeeded in winning eight straight world-title contests. Other unprecedented feats accredited to the Yankees included going through four world-series games without change of pitcher, and the batting mark of .625 for four games set by George Herman (Babe) Ruth.

The race for the American League pennant was of the closest nature, the Philadelphia Athletics making a wonderful spurt to wipe out a 13½ game margin gained by the Yankees early in the season. The Athletics actually assumed the lead on September 8. A series be-

tween the two teams opened the following day at the Yankee Stadium with a double header which attracted 85,265 spectators, the largest baseball crowd in history. The Yankees won both these games and eventually finished 2½ games ahead of the Athletics.

The National League struggle also was of the bitterest sort with the New York Giants, Cincinnati Reds, Brooklyn Robins, and St. Louis Cardinals setting the early pace. The Cardinals went into the lead on June 16 and remained there until the end, but they were never able to shake off their rivals. Early in August the Giants lost eight games in a row and as it turned out this reverse cost them the pennant, the Cardinals finishing two games in the van.

The leading batters of 1928 were Rogers Hornsby of the Boston Braves in the National League with an average of .387 and Leon A. (Goose) Goslin of the Washington Senators in the American League with .379. James Bottomley of the St. Louis Cardinals and Gordon Cochrane of the Philadelphia Athletics were voted the most valuable players in their respective leagues. The two leading pitchers in the National League were Larry Benton of the Giants in percentage of victories and Dazzy Vance of the Brooklyn Robins in effectiveness. In the American League, Ernie Crowder of the St. Louis Browns and Garland Braxton of the Washington Senators shared these honors.

The pennant winners in the more important minor leagues in 1928 were: International, Rochester; American Association, Indianapolis; Pacific Coast League, San Francisco; Eastern, New Haven; New England, Lynn; Southern Association, Birmingham; South Atlantic, Asheville.

The popularity of baseball in Japan showed an amazing growth in 1928, crowds of 50,000 being attracted to the Sunday games in the larger cities. Cuba maintained its usual leagues with interest in the various races unabated.

College baseball, as in former years, failed to pay expenses even when teams of especially excellent calibre were developed. The University of Pennsylvania captured the Eastern Quadrangular League championship. New York University, Fordham, Georgetown, and Holy Cross also had exceptionally strong nines.

BASHFORD, HERBERT. American author, librarian, and playwright, died at Piedmont, Calif., July 13. He was born at Sioux City, Iowa, Mar. 4, 1871, and was educated at public and private schools. He was head of the public library of Tacoma, Wash., and State librarian of Washington, 1897-1901. He was a member of the editorial staff of the *San Francisco Bulletin*, 1909-19. His play, *The Woman He Married*, was produced by Virginia Harned in 1910, and *Taken In* by Henry B. Walthall in 1920. He wrote a number of books also, including: *Northwest Nature Stories* (1897); *Songs From Puget Sea* (1898); *The Tenting of the Tillicums* (1905); *At the Shrine of Song* (1909); *Yosemite* (a poem) (1924). Besides the two plays mentioned he wrote also: *Running for Governor*, *Heritage of the Red*; *The Defiance of Doris*, and *The Voice Within*.

BASKETBALL. This branch of sports maintained its popular appeal in 1928 and thousands of college, school, A. A. U. industrial, and Y. M. C. A. "fives" throughout the United States played through long schedules. The champion-

ship of the Eastern Intercollegiate League was won by the University of Pennsylvania, but only after a play-off battle with Princeton which the Philadelphians captured by a score of 24 to 22. Indiana and Purdue tied for the Western Conference title, each team having ten victories as against two reverses. The University of Southern California produced the strongest five in the Pacific Coast Conference. The University of Pittsburgh played through a schedule of twenty-one games without suffering defeat. The National A. A. U. championship was won by the Cook County Paint Co. team of Kansas City, Mo.

BASSETT, JOHN SPENCER. American historian, died at Washington, D. C., January 27. He was born at Tarboro, N. C., Sept. 10, 1867. After his graduation from Trinity College, N. C., in 1888, he was appointed professor of history there, in 1893; and in 1906 became professor of history at Smith College, Northampton, Mass. He was a member of several American historical societies (secretary of the American Historical Association from 1919 until his death), and a fellow of the Royal Historical Society of London. Besides five volumes on the history of North Carolina, he wrote: *The Federalist System* (1905); *Life of Andrew Jackson* (1911); *A Short History of the United States* (1913); *The Plain Story of American History* (1915); *The Middle Group of American Historians* (1917); *The Lost Fruits of Waterloo* (1918; 2d ed. 1919); *Our War With Germany* (1919), *Selections From the Federalist* (1921), and *The League of Nations; a Chapter in World Politics*, published in 1928, shortly after his death. He also edited, among other works, the following: *Writings of Colonel William Byrd, Esq. of Westover, in Virginia*, (1901); *Correspondence of George Bancroft and Jared Sparks* (1917), and *The Correspondence of Andrew Jackson* (6 vols., 1925).

BATES COLLEGE. A non-sectarian college for men and women at Lewiston, Me., founded in 1864. For the autumn term of 1928 there were 615 students, of whom 356 were men and 259 women; in the summer session there was a total of 229, of whom 96 were men. The faculty and administrative officers numbered 50. The permanent funds amounted to \$1,800,000; total expenditures for the year were \$254,144; and the budget involved an appropriation of \$280,052. The library contained 55,732 volumes. The year 1927 saw the renovation of a recitation building, providing more class rooms and offices; the honors courses for superior students, previously adopted, were further developed and improved; and a debating team which was sent around the world met representative teams at some 25 leading universities of New Zealand, Australia, South Africa, and Great Britain. President, Clifton Daggett Gray, Ph.D., LL.D.

BATTLE CRUISER. See NAVAL PROGRESS.

BATTLESHIP. See NAVAL PROGRESS.

BATTISTINI, MATTIA. A famous Italian baritone, died at Rieti, near Rome, November 7. He was born in Rome, Feb. 27, 1857, and made his debut in Donizetti's *Favorita* at the Teatro Argentina in Rome, in 1878. After that he sang for some years in Buenos Aires, then returned to Italy and appeared in London in 1883 and 1887, without attracting unusual attention. But when, in 1888, he was heard at La Scala, in Milan, he created a sensation, and from that time on he

was regarded as the foremost of Italian baritones, constantly filling engagements at all the great European opera houses, almost until his death. His voice was of marvelous beauty and power, and even in the last years showed little influence of the passage of time. Whatever may have been the reason for his refusal, the fact remains, that this world-famous artist firmly declined repeated offers to appear in the United States.

BAUMES LAWS. See CRIME.

BAUXITE. The production of bauxite in the United States in 1927 was 320,940 long tons, valued at \$1,988,780, a reduction of 18 per cent both in quality and value, as compared with 1926 when the production was 392,250 long tons, valued at \$2,415,200. Arkansas, with an output of 303,830 tons, valued at \$1,892,860, was the leading bauxite producing State in the Union in 1927, while in Alabama production was limited entirely to the Eufaula district, Barbour County, which was opened in 1926, and no bauxite was produced in Tennessee. World production of bauxite increased during the year along with expansion in the manufacture of aluminum, the growth of the chemical and abrasive industries, and an increasing demand for aluminous cements. Exports of bauxite and bauxite concentrates increased, especially during 1926 and 1927, in response to increased aluminum manufacture in the Canadian and Norwegian plants of the Aluminum Co. of America. Exports from the United States in 1927 totaled 121,858 long tons valued at \$7,800,491, and imported bauxite, especially from South America, increased in quality and value, the total imports being 356,580 tons valued at \$1,572,236.

BAVARIA. A constituent state of the German Republic; formerly a kingdom within the German Empire, ruled for more than a century by the Wittelsbach dynasty, which was deposed after the revolution following the World War. The new state adopted a republican form of government on Nov. 22, 1918. Area 29,334 square miles; population, according to the census of 1919, 7,140,340; according to the census of 1925, 7,379,594. Chief cities: Munich, with a population of 680,704 in 1925; Nuremberg, 392,494; Augsburg, 165,522; Ludwigshafen, 101,869. In 1926 there were 52,683 marriages; 160,179 births; and 96,474 deaths. The religious division of the population of Dec. 1, 1925, was: Roman Catholics, 5,164,786; Protestants, 2,110,327; Jews, 49,163. Education is compulsory between the ages of 6 and 16. In 1926 the chief crops with their areas and yields were as follows: Wheat 668,102 acres, 338,561 metric tons; rye, 1,029,525 acres, 459,603 tons; oats, 1,072,930 acres, 645,249 tons; potatoes, 940,122 acres, 2,962,872 tons; vines, 57,990 acres, 7,322,656 gallons; hops, 30,022 acres, 1889 tons. The census of livestock in the same year showed 414,773 horses, 3,566,584 cattle, 407,061 sheep, 2,106,860 pigs, and 422,000 goats. In 1926 the output of coal was 2,247,768 metric tons; of iron ore, 417,111 tons; pig iron, 225,476 tons, cast-iron ware, 132,950 tons; sulphuric acid, 315,347 tons.

The constitution dates from Aug. 14, 1919. Under it, the supreme power is vested in the people, who are represented by a diet of one chamber elected for four years on a basis of universal, equal, direct, secret, and proportional suffrage, all citizens over 21 years of age having

the right to vote. There is one representative for every 62,000 inhabitants, making a legislature of 129 members. The various parties represented in the Bavarian National Constituent Assembly (elected April and May, 1924) were as follows: Bavarian People's party, 46; Social Democrats, 25; Völkischer Bloc, 12; National Socialists, 6; German Nationals and National Liberals, 14; Bavarian Peasants' and Middle-Class Union, 12; Communists, 7; others, 7. The cabinet as constituted in 1928 was as follows: Premier and Minister of Foreign Affairs, Dr. Held; Education, Herr Goldenberger; Commerce and Industry, Dr. Held; Social Welfare, Herr Oswald; Agriculture, Professor Fehr; Interior, Herr Stuetzel; Finance, Dr. Schmelzle; Justice, Herr Gürtner.

BEAN BEETLE, MEXICAN. See ENTOMOLOGY, ECONOMIC.

BEAUX-ARTS INSTITUTE OF DESIGN.

A school of fine arts in New York City, planned after the École des Beaux-Arts in Paris; organized in 1916 by the Society of Beaux-Arts Architects, for the purpose of furnishing "instructions in the arts, under the Regents of the State of New York, at a minimum cost to students, to bring art students under the criticism of artists who are engaged in active practice, to carry students beyond the academic study of the arts into the province of their application and practice, and to bring about co-operation among the various art schools of the country." The institute maintains a school of sculpture at its headquarters, in which the instructors are sculptors of high standing, who volunteer their services, each serving a term of three months in the life classes, while the instructors in architectural ornament serve for one month or the duration of the treatment of the style which is the subject of the study schedules. A department of architecture is also conducted for the purpose of furnishing a systematic training in architectural design for draughtsmen in offices and for students of architecture in general. Prizes in architecture, sculpture, and mural painting are offered to students throughout the United States. Working under the auspices of the Institute in 1927-28 were 2077 architectural students, 204 students of sculpture, 165 in mural painting. Except in the case of the Paris Prize competitions, there are no restrictions as to the nationality or age of entrants.

The courses offered in the department of sculpture include: Life modeling and architectural sculpture; architectural ornament; life drawing; antique modeling; composition; and a sketch class. During the year 1927-28, the committee on education in the department of architecture conducted twenty-eight competitions for the study of architecture and six for the study of archæology, in addition to the three competitions for the Paris Prize. Various prizes and scholarships were offered to its students through the institute, the most important being: The Paris Prize of \$3600, given by the Society of Beaux-Arts Architects for two and one-half years' study in architecture at the École des Beaux-Arts in Paris (all the competitors, including the winner, in the final competition, receive \$150 each, provided their work is considered satisfactory); the Paris Prize in Sculpture, and a scholarship of \$1200, for one year's study in Paris.

The institute issues a monthly *Bulletin* in which are published the results of all contests, with the reproductions of the best designs submitted. Officers elected at the annual meeting in November, 1928, were: Director, Whitney Warren; director of architectural department, Edward S. Hewitt; department of sculpture, Edward McCartan; mural painting, J. Monroe Hewlett; chairman of the board of trustees, Benjamin W. Morris; vice chairman, William Adams Delano. Headquarters are at 304 East 44th Street, New York.

BEAVER. See ZOOLOGY under *Mammals*.

BECKWITH, THE RIGHT REV. CHARLES MINNEGEODE. American clergyman and bishop of the Protestant Episcopal diocese of Alabama, died at Montgomery, Ala., April 18. He was born in Prince George County, Virginia, June 3, 1851, and was educated at the University of Georgia and the Berkeley Divinity School. After serving as an instructor at the University of the South, he was ordained deacon in the Protestant Episcopal Church in 1881 and priest in 1882. He was assistant rector of St. Luke's Cathedral, Atlanta, Ga., 1880-86; a rector at Houston, Tex., 1886-92; general missionary in the diocese of Texas, 1892-95, and a rector at Galveston, Tex. 1891-1901. He was consecrated bishop of Alabama in 1902. He received the degree of D.D. from the University of the South, 1902, and in 1903 that of S.T.D. from the Berkeley Divinity School. He wrote: *The Trinity Course of Church Instruction* (1898); *The Teacher's Companion to the Trinity Course* (1901); *Rightly Instructed in God's Holy Word* (1902).

BELGIUM. A kingdom of western Europe, situated between France and the Netherlands. Capital, Brussels.

AREA, POPULATION, ETC. The total area, including the districts of Eupen and Malmédy, which were ceded to Belgium after the Treaty of Versailles, is 11,755 square miles. The population, according to the official census of 1920, was 7,465,782; estimated, in 1927 at 7,931,844, which represented a density of 675 per square mile. The chief cities with their population as of Dec. 31, 1926 are Brussels (with suburbs), 808,664; Antwerp, 300,175; Liège, 168,058; Ghent, 162,582. The movement of population in 1926 was: Births, 149,943; deaths, 104,742; marriages 72,517. The emigrants in 1926 numbered 36,150 and the immigrants, 44,525.

EDUCATION. For primary instruction there were in 1927, 8343 primary schools, with 800,400 pupils; 3866 infant schools with 245,650 pupils; and 2104 adult schools with 61,266 pupils. For higher education there were 24 atheneums and colleges, with 8280 pupils; five special atheneums with 388 students; four communal and provincial colleges with 2027 students, and nine private colleges with 1481 students. The next grade of schools are the higher grade schools, of which there were 131 State schools with 28,944 pupils, 17 communal and provincial schools with 5021 pupils, and seven private higher-grade schools with 764 pupils. There are six normal schools for training secondary school teachers and 81 for training elementary school teachers. There are many private or free schools, mostly under

ecclesiastical care. For collegiate education there are universities at Brussels (1829 students in 1926-27); Ghent, 1619; Liège, 2294; Louvain, 3394; and the Colonial University at Antwerp.

PRODUCTION, MINERAL RESOURCES, ETC. Of the total area of 2,945,104 hectares, there were, in 1926, 1,786,750 hectares under cultivation, of which 38.98 per cent were under cereals, 1.18 per cent under vegetables, 5.58 per cent under industrial plants, 13.80 per cent under root crops, and 40.46 per cent under forage. The acreage and yield of the principal crops in 1926 were as follows: Wheat, 354,282 acres, 6,967,682 cwt; barley, 86,932 acres, 1,829,554 cwt; oats, 667,720 acres, 14,726,628 cwt; rye, 557,585 acres, 10,215,242 cwt; potatoes, 396,470 acres, 3,012,589 metric tons; beet (sugar), 158,142 acres, 1,682,827 metric tons; beet (fodder), 193,853 acres, 4,668,353 cwt; tobacco, 6891 acres, 119,320 cwt. On Jan. 1, 1927, there were 250,287 horses, 1,711,702 horned cattle, and 1,143,860 pigs. The most important industries in Belgium are artificial silk, automobiles, glass, iron and steel, lace, linen, and gloves.

Mineral production has always been an important industry in Belgium. The country has natural resources of coal and zinc and after the economic union with Luxemburg in 1922 gained ready access to iron ore. The Belgian coal industry passed through a critical period in 1927, following a rather favorable year in 1926 under conditions largely influenced by the long strike in Great Britain. The outstanding features of the 1927 situation were the continuous accumulation of stocks at pit heads, the steady decline in prices of industrial coal, and the steadily increasing production which passed all records of pre-war and post-war years. Under these circumstances the situation of the coal mines, so satisfactory at the beginning of the year, grew constantly worse. During the last two months matters became so acute that mining interests sought to curtail production by operating on part time.

The consumption of coal, however, remained active. The difficulties, on the whole, apparently resulted from the restricted sale of Belgian coal, owing to the keen competition furnished by British and German producers. With the termination of the British strike, high prices gradually receded and British coal reappeared. A heavy stock accumulation naturally followed in 1927, as well as disastrous competition.

The principal coal deposits in Belgium are in the vicinity of Charleroi. Next in order come the mining centres of Mons, Liège, Centre, Limburg, and Namur. Complete figures covering coal extraction in 1927 show a total of 27,573,550 tons produced by all the operating mines, an increase of 9 per cent over that of 1926. The production of coke during the same year established a new high record for the country. The total production was 5,386,530 tons, as compared with 4,945,920 tons in 1926. The output of briquets was 1,714,000 tons, considerably under that for 1926. See COAL.

The output of other minerals in 1927 was: Pig iron, 3,751,440 metric tons; wrought iron, 166,620 tons; steel, 3,708,495 tons; wrought steel, 3,062,220 tons; crude zinc, 201,630 tons.

COMMERCE. Belgian foreign trade during 1927 increased heavily as compared with the preceding year. Total imports in 1927 were valued at 29,179,537,000 francs (\$811,191,000) as against 22,999,448,000 (\$749,782,000) in 1926; in weight

they increased from 34,379,000 metric tons to 38,000,000 metric tons. There was an even greater increase in the value of exports, from 19,941,774,000 francs (\$650,102,000) in 1926 to 26,620,738,000 francs (\$740,057,000) in 1927; in volume, exports rose from 23,187,000 metric tons to 24,134,000 metric tons. While the visible trade balance was, as usual, adverse, the value of exports in relation to imports marked a further substantial gain. In 1925 the value of exports was 82 per cent of that of imports, in 1926 it was 87 per cent, and in 1927 it was 91.5 per cent.

Features of the trade statistics are the much higher imports of raw materials and the even greater advance in exports of manufactured products. The increase in imports, as well as in exports, comprise practically all categories of merchandise and relate not only to values but also rather generally to quantities. Among the important items showing the principal advances are hides and skins, textile, animal, and metal products; exports of rubber goods, hides, and skins, arms, vehicles, metal products, machinery, and vegetable products increased heavily. There was little change in the relative importance of various countries in Belgian foreign trade. France was first as source of imports and Great Britain was the largest market for exports. Germany was second in importance as a supplier and also as buyer. The other countries of principal importance were the United States, the Netherlands, Argentina, Belgian Congo, Italy, and Switzerland.

Imports from the United States during 1927 totaled 1,093,000 metric tons, very slightly higher than in 1926; their value of 3,218,000,000 francs (\$89,460,000) marked an advance over the preceding year. Purchases of grains increased heavily and were by far the most valuable of the imports. Cotton takings also made a large advance. Other items of principal value on the import side were mineral oils, crude copper, automobiles, oilseed cakes, motors and engines, tobacco, and lumber. Practically all kinds of imports from the United States increased in value and many large quantity increases were registered. Exports to the United States amounted to 951,000 metric tons, valued at 2,412,000,000 francs (\$67,654,000). While the tonnage figure was lower than in 1926 the franc value was higher. Diamonds constituted by far the heaviest item of export to the United States. Although, according to official statistics, their value dropped heavily in 1927, they comprised almost one-quarter of the total value of exports to this country. However, it is generally believed that the falling off is only apparent and that if smuggling operations are taken into account, the exports during 1927 were higher than in 1926.

The second largest classification is textile products, including principally linens, cotton fabrics, and rayon, which showed a big increase. Other principal exports to the United States were manufactures of iron and steel, glass, rabbit skins, cement, untanned skins, leather goods, chemical products, and paper. Exports of cement and of chemical products were much lower than in 1926, and glass exports declined slightly.

FINANCE. The budget estimates for 1928 carried revenues of 10,563,562,000 francs and expenditures of 9,482,731,000 francs; for 1929, revenues of 11,485,090,000 francs and expenditures of 10,255,206,000 francs. On Jan. 1, 1928,

the Belgian public debt amounted to 55,060,000,000 Belgian francs. Internal consolidated debt was 22,346,000,000 francs; internal floating debt, 4,180,000,000 francs; external consolidated debt, 28,577,000,000 francs. Since the stabilization of the Belgian currency in October, 1926, there had been some misunderstanding as to the proper uses and purpose of the created monetary unit—the belga. In his report to the King concerning the stabilization decrees, the Prime Minister stated that the franc remains the basis of the monetary system and will retain its rôle in the national economy. Since the franc continues to circulate in the country, however, it is important that the world should be clearly informed of the profound change in the Belgian fiduciary circulation effected by the stabilization decrees. For this reason the Belgian exchange value of the franc is henceforth established at the multiple of five, which is quoted only for foreign exchange and for that purpose bears the name of "belga." The belga is a mere multiple of the franc and both are at all times interchangeable on the basis of five francs for one belga. The stabilization decree stated that it was forbidden to publish the Belgian franc exchange value in any other form than the belga, and the parity with foreign moneys was established at the rate of 0.20911 grains fine gold for one belga. In case the National Bank issues notes in terms of the belga, they also shall bear a notation of their value in francs. Notes showing their value in francs only are at all times interchangeable with belga notes in the proportion of five to one.

COMMUNICATIONS. The Belgian Government-owned railways began operation as a private company on Sept. 1, 1926, under the company name of Société Nationale Chemins de Fer Belges. The length of the lines owned by this company as of December 31, 1927, totaled 10,404 kilometers, of which 4795 kilometers were main line and 5609 kilometers branch lines and sidings. In order to permit the fiscal year of the railroads to coincide with the calendar year, the first year of operation was carried over from Sept. 1, 1926, to Dec. 1, 1927. The financial results of this 16-month period were as follows: Operating revenues amounted to 3,709,267,147 francs and other revenues to 16,189,967 francs; operating expenses reached 3,121,483,819 francs and other expenses 6,376,334 francs. There were in operation at the close of the year 2734 locomotives, 110,378 freight cars, and 8451 passenger cars.

No new stock had been purchased during the year 1928. In general the rolling stock of the Belgian railroad system was in good condition, although new equipment was noticeably lacking. After the transformation of the Belgian railways into a private corporation, considerable quantities of worn-out locomotives and other rolling stock were scrapped; the remaining equipment was sufficient for the then current needs of the country. The company felt no pressing need for any large amount of new equipment, but plans were being made to cut operating expenses by improvements to the 1928 material, particularly by equipping rolling stock with automatic air brakes. It was stated that the financial situation of the company was sufficiently strong to permit expenditures for new equipment without the necessity of calling for new funds from the public.

The Belgian inland waterways are navigable over 1674 kilometers and their traffic exceeds 28,000,000 metric tons annually. The Belgian Parliament by the Law of Aug. 13, 1928, provided for the central administration of the affairs of these waterways which, with the introduction of motor power since the War, have new importance in Belgian trade and transportation. The programme of motorization calls for 300 hauling tractors in service in 1931. The number of vessels entering Belgian ports in 1926 was 18,931 of 26,944,889 tons; cleared, 18,916 of 26,946,808. In 1927, 11,418 vessels of 23,490,300 tons entered and 11,476 of 23,594,606 tons cleared the port of Antwerp.

GOVERNMENT. Belgium is a constitutional, representative, and hereditary monarchy. Executive power is in the King, acting through a responsible ministry; legislative power is in the King and two chambers, namely the Senate and House of Representatives. The former is elected partly by the direct and partly by the indirect vote of the people, the number being equal to half the number of members of the lower house and proportioned to the population of each province. Those elected indirectly are chosen by the provincial councils. The parties in the Senate elected in 1925 are: Catholics, 71; Liberals, 23; Socialists, 59. The 186 members of the lower house are elected by universal suffrage directly for four years. The party alignment in the House is: Catholics, 78; Socialists, 79; Liberals, 22; miscellaneous, 8. The reigning monarch in 1928 was Albert, who succeeded his uncle, Leopold II, Dec. 17, 1909. The cabinet as appointed Nov. 22, 1927, was composed as follows: Prime Minister and Minister of the Colonies, Henri Jaspar (Catholic); Foreign Affairs, Paul Hymans (Liberal); Justice, M. Janson (Liberal); Education, Maurice Vauthier (Liberal); Finance, Baron Houtart (Catholic); Agriculture and Public Works, Henri Bael (Catholic); Industry, Labor, and Social Insurance, M. Heyman (Christian Democrat); Railways, Marine, Posts and Telegraphs, and Aeronautics, M. Lippens (Liberal); National Defense, Comte de Broqueville (Catholic); Interior, M. Caroy (Christian Democrat).

HISTORY. Belgium passed through a comparatively quiet year. There was some friction with France over the question of the "most favored nation" clause in the treaties between France and Germany and France and Belgium and the consequent reduction in Franco-Belgian trade, largely due to the fact that Germany and Belgium produce approximately the same goods, and France felt that she should buy in Germany in order to reduce the reparations account.

The most striking single event was probably in discussion over the inscription to be placed on the Louvain Library. The library, which was restored by gifts of money collected in America, and which was under the general supervision of Whitney Warren, New York architect, was supposed to have an inscription in Latin, "Furore Teutonico Diruta: Dono Americano Restituta." The translation of this, "Destroyed by Teutonic Fury: Restored by an American Gift," aroused severe comment on the grounds that it tended to perpetuate war hatreds. Mr. Warren insisted that the inscription, which he stated was approved by the late Cardinal Mercier, should be placed on the façade, although he accepted the word "folly" in place of "fury." The Rector of Louvain University, of which the library is a part, object-

ed to the inscription and ordered another balustrade to be built without the inscription. Feeling ran high throughout the country. Some factions favored the retention of the inscription and some opposed it. King Albert and Herbert Hoover were opposed to the inscription and in the end the building was dedicated without it, on July 4, the only reminder of the World War being a bas-relief showing the burning of the old library.

During the summer King Albert and Queen Elizabeth made an extended visit to the Belgian Congo. See MILITARY PROGRESS.

BELL, JOHN KEBLE. English novelist and playwright, died at Bournemouth, England, March 29. He was born at Basingstoke, England, June 8, 1875, and was educated at Wantage and at Worcester College, Oxford. Beginning newspaper work at London on the staff of the Press Association, he became editor of *The Sketch*, 1902-04, and dramatic critic of the *Daily Mail*, 1904-08. He founded the Croydon Repertory Theatre in 1913. He wrote many plays and novels under the pen name, "Keble Howard." Among his plays are *Compromising Martha* (1906); *The Dramatist at Home* (1909); *The Girl Who Couldn't Die* (1911), *The Embarrassed Butler* (1912); *The Test Kiss* (1918); *The Smiths of Surbiton* (1922); *Lord Babs* (1925). His other publications and novels include: *The Chicot Papers* (1901); *Love and a Cottage* (1903); *The God in the Garden* (1904); *Love in June* (1905); *Bachelor Girls* (1905); *The Cheerful Knave* (1910); *One in the Family* (1911); *Merry-Andrew* (1915); *The Smiths in War-Time* (1918); *Puck and Mr. Purley* (1920); *The Fast Lady* (1925); *Paradise Island* (1926); *My Motley Life*, an autobiography (1927).

BELLOTT, bē'lō, HUGH HALE LEIGH. English lawyer and honorary secretary of the International Law Association, died while at the association's conference at Warsaw, August 11. Dr. Bellot was born Oct. 19, 1860, and attended Leamington College, later being graduated from Trinity College, Oxford. In 1890 he was called to the bar by the Inner Temple. He held the position of honorary secretary of the Grotius Society, and he was at one time acting professor of constitutional law at the University of London. He wrote many reviews and books. Among the latter are *Unconscionable Bargains with Moneylenders* (1897); *Bargains with Moneylenders* (1st ed. 1897, 2d ed. 1906); *The Inner and Middle Temple* (1902); *Commerce in War* (1907); *The Temple* (1914); *Pitt Cobbett's Leading Cases on International Law* (1922-24); *Foot's Private International Law* (1925, 5th ed.); and *Gray's Inn and Lincoln's Inn* (1925).

BENET, MRS. WILLIAM ROSE. See WYLIE, ELLINOR.

BENNETT, FLOYD. American aviator, died at Quebec, Canada, April 25. He was born at Warrensburg, N. Y., Oct. 25, 1890, and was educated at Lake George, N. Y. Early in life he became an automobile mechanic, leaving that occupation to enlist in the aviation corps, U. S. Navy, in 1917. During the World War he was an instructor in aviation mechanics at the naval base, Hampton Roads, Va. In 1922 he was transferred to Norfolk, Va., where he met Commander Richard E. Byrd, U.S.N., with whom the rest of his life was closely associated. Bennett was the pilot of the plane in which Byrd flew across the North Pole, and was chosen by Byrd as second in command of the projected flight to the South Pole

and return. Injuries prevented Bennett from accompanying Byrd on the transatlantic flight of the latter, but he had recovered from them when he flew from Detroit, Mich., to Lake St. Agnes, near Murray Bay, Que., in an attempt to aid the crew of the transatlantic flier, *Bremen*, stranded on Greenly Island. He was ill before the relief flight began, and he succumbed to pneumonia.

BEREA COLLEGE. A non-sectarian, coeducational institution at Berea, Ky., founded in 1855, and designed to serve the educational needs of the mountain people of the Southern Appalachian region. The enrollment for the autumn of 1928 was 1942, distributed as follows: College, 437; normal, 319; academy, 420; Foundation-Junior high school, 622; training school, 134. The enrollment in the summer session of 1928 was 453, of whom 191 were in the college, 167 in the normal school, and 95 in the academy. The faculty numbered 104, distributed as follows: College, 30; normal, 12; academy, 19; Foundation-Junior high school, 32; training school, 4; music, 8. The endowment amounted to \$8,894,739, and the income for the year ending June, 1928, was \$357,223. The library in 1928 contained 57,779 volumes. A science building, men's gymnasium, and animal husbandry building, were completed during the year. President, William J. Hutchins, D.D., LL.D.

BERKSHIRE FESTIVAL. See MUSIC.

BERMU'DA. A British colony in the West Indies consisting of a group of small islands lying about 580 miles from Cape Hatteras, N. C. About 20 of the islands are inhabited. Because of its picturesqueness and proximity to New York (677 miles), it is a favorite winter resort for American tourists, who in 1926 numbered 27,215. Area, 19.3 square miles; population, according to the census of 1921, 20,127 (7006 white). The estimated civil population in 1926 was 30,113. Statistics for commerce and finance follow:

	1925	1926
	£	£
Imports	1,325,041	1,404,824
Exports	166,020	239,553
Revenue	248,476	314,298
Expenditure	312,288	291,209

In 1925 the total tonnage of vessels entered and cleared was 2,749,780 tons of which 2,367,482 were British. The public debt in 1926 was £50,000. The chief products are potatoes, onions, lily bulbs, and various vegetables. The chief imports in 1926 were: Provisions, beef, bran, clothing, cotton goods, electrical goods; flour; hardware; fuel oil; and woolen goods. The chief exports are potatoes; onions; other vegetables; bulbs, and whisky. The administration is under a governor assisted by an executive council of seven members and a legislative council of nine members appointed by the King and an elected assembly of 36 members. Governor in 1928, Lieut.-Gen. Sir Louis Jean Bols.

BERRIES. See HORTICULTURE.

BERRY, HENRY SEYMOUR. See BUCKLAND, LORD.

BERRY, JOHN BENNINGTON. American engineer, died at Three Lakes, Wis., June 22. He was born at Paterson, N. J., Dec. 14, 1851, and was educated at the Brooklyn, N. Y., Polytechnic Institute. He entered railway service in 1874 as

an assistant engineer on the Chicago & Northwestern R. R., and advanced through various positions until he became chief engineer of the Union Pacific Railway, in 1893. In 1905 Mr. Berry left the Union Pacific to become chief engineer of the Chicago, Rock Island & Pacific Railway, and in 1914 he resigned from railway service to engage in consulting practice in Chicago. In 1905 he was appointed a member of the board of consulting engineers of the Isthmian Canal Commission. He wrote, in 1904, a monograph on railway-grade reduction considered an authoritative presentation of the matter.

BES'SARABIA. Formerly a government of the Russian Empire; joined to Rumania in March, 1918. See RUMANIA.

BIBLE LANDS. See ARCHEOLOGY.

BIBLE SOCIETY, AMERICAN. A society founded in 1816 which strives for a wider circulation of the Bible to all people, without denominational or racial discrimination. The Bibles are furnished at cost prices and distributed through the Society's home, foreign, and other agencies. In 1927 home agencies distributed 3,762,811 volumes; the foreign agencies, 4,879,674. The Society also supplied the Scriptures in 166 languages during the year, including editions in Roman and Gothic characters and embossed systems for the blind. The total issues of the Society in 112 years of service have been 194,063,757 volumes, of which 108,132,107 were distributed in the United States and 85,931,650 in foreign lands. The number of issues in the United States in 1927 was 5,755,251, of which 2112 were for the blind, and in other lands, 4,279,546, making a total of 10,034,797. Workers in the 10 home agencies totaled 927, of whom 412 were volunteers; workers in the 12 foreign agencies numbered 2542, 676 being volunteers.

The translation of the Bible into additional languages, and revision of existing versions, continued through the year. In the United States, progress was made in the revision of the Gospels in Yiddish, and four Gospels in Hopi; the reproduction of the Cherokee Scriptures, which was out of print, and the translation of the Scriptures into Acoma, spoken by Indians in New Mexico. In Latin America, progress was made in translation work in Quiché, Mam, and Cakchiquel, spoken in Guatemala; Peruvian Quechua and Bolivian Quechua, and Aymara, spoken in the upper Andes region. In Africa, the Bible was published in Luba-Lulua; and progress was made toward completing the New Testament in Luragoli and Gospels in Olunyore and in a revised Sheetswa New Testament. Steps were taken toward publishing the Gospels in Bakuese and in Shilluk. In Europe, the preparation of a Gospel in Bulgarian characters for the Gypsies was authorized. In the Far East, the Society shared in a new publication of a diglot Gospel of Matthew in Urdu and Arabic. In Siam, the Bible was completed in Lao or Tai Yuan, and work was going on in Tai Lu. In the Philippines, progress was reported on the revision of the New Testament in Tagalog, and portions in Samareño. In China, a tentative revised Canton Colloquial New Testament proved very popular, and additional work was done on the revision of the Suchau Colloquial.

The total receipts of the Society for the year from invested funds, gifts, sale of books, etc.,

amounted to \$1,060,809.48; its expenses were \$1,084,662.37. The Society was affiliated with 95 auxiliary Bible societies throughout the United States, which assisted in the circulation of the Scriptures and contributed for its expenses. In 1927 the contributions received from this source amounted to \$14,724.71. The officers in 1928 were: E. Francis Hyde, president; the Rev. Eric M. North, Ph.D., and the Rev. George William Brown, M.A., general secretaries; the Rev. Lewis B. Chamberlain, D.D., recording secretary; and Gilbert Darlington, treasurer. The official organ of the Society is the *Bible Society Record*. The headquarters of the American Bible Society are at the Bible House, Astor Place, New York City.

BIBLIOGRAPHY. See PHILOLOGY, MODERN. **BICKERSTAFFE-DREW, THE RIGHT REV. MONSIGNOR COUNT FRANCIS BROWNING DREW** (John Ayscough). English prelate of the Roman Catholic Church and novelist (nom de plume, John Ayscough), died at Salisbury, England, July 3. He was born at Headingley, Leeds, England, Feb. 11, 1858, and was educated at the King Edward VI school, Lichfield; at St. Chad's College, Denstone; at Oxford, and at the Seminary of St. Thomas, Hammersmith. He was ordained a priest in the Roman Catholic Church in 1884, and in 1886 became a chaplain in the British Army. His ecclesiastic career was spent entirely in the military service, and he was especially prominent in the World War, in which he held the rank of assistant principal chaplain royal. He was twice mentioned in dispatches in the first year of the War, and received later the Mons medal with two roses, the Victory medal, the General Service medal, and the Order of the British Empire. His honors from his church included a knighthood of the Sacred Military Order of the Holy Sepulchre and the title of count. Using his pen name, John Ayscough, Mgr. Bickerstaffe-Drew published more than twenty novels, a volume of impressions of America, and a book of reminiscences. Among his many novels are *Rosemary, Dromina, A Roman Tragedy*, and *A Prince in Petto*.

BICYCLING. See CYCLING.

BILLIARDS. Frank Taberski was the outstanding figure in the billiard world during 1928 due to his spectacular victory over Ralph Greenleaf in the final games of the world championship pocket-billiards tourney held in Chicago in December. Owing to a decision of the National Billiard Association that a disputed game of the regulation tourney must be replayed, it became necessary for Taberski not only to win this replay, which would mean a tie for the title, but also to capture the resulting play-off in order to gain the championship. This difficult feat Taberski performed, winning the two games by the scores of 125 to 97 and 125 to 41.

John Layton retained his world and national three-cushion titles, Willie Hoppe affording his chief opposition in both tourneys. Edouard Horemans of Belgium won the 18.2 balkline championship in a match with Jacob Schaefer contested at San Francisco. The usual amateur 18.2 title tourney was cancelled because of dissension among the Western players. Francis S. Appleby successfully defended his amateur 18.1 title in a tournament held in February. James Collins wrested the amateur pocket billiard honors from J. Howard Shoemaker.

BISHOP, JOSEPH BUCKLIN. American journalist and author, died at New York, December 13. Born at Seekonk, Mass. (now East Providence, R. I.), Sept. 5, 1847, he was graduated from Brown University in 1870. Obtaining a position as a reporter on the New York *Tribune* in that year, he was soon placed on the editorial staff, where he remained until made an editorial writer on the New York *Evening Post* in 1883. He became, in 1900, chief of the editorial staff of the New York *Globe*. Appointed secretary of the Isthmian Canal Commission by President Roosevelt in 1905, he served as one of the earliest Federal information officials, editing the *Canal Record*, a weekly paper, and managing the publicity; he continued with the commission until the construction was completed, in 1914. Brown University conferred the Litt.D. degree on him in 1923. He edited *Theodore Roosevelt's Letters to his Children* (1919), and wrote: *Cheap Money Experiments* (1892); *Our Political Drama* (1904); *Issues of a New Epoch* (1904); *The Panama Gateway* (1913); *A Chronicle of One Hundred and Fifty Years* (1918); *Theodore Roosevelt and his Time, Shown in His Letters*, 2 vols. (1920); *Life of Charles J. Bonaparte* (1922); *Life of A. Barton Hepburn* (1923); and *Notes and Anecdotes of Many Years* (1925). At the time of his death Mr. Bishop was preparing a biography of George W. Goethals.

BITUMINOUS COAL STRIKE. See STRIKES AND LOCKOUTS.

BIXBY, WILLIAM HERBERT. American military engineer and retired brigadier general, U. S. Army, died at Washington, D. C., September 29. He was born at Charlestown, Mass., Dec. 27, 1849, and, after attending the Massachusetts Institute of Technology, 1866-67, he was appointed to the U. S. Military Academy, being graduated in 1873. He was commissioned second lieutenant in the Corps of Engineers, becoming assistant professor of engineering at West Point in 1875. He was sent to France in 1880 to observe manœuvres of European armies and inspect fortifications and other engineering works. He studied at the French École des Ponts et Chaussées and was graduated in 1881. On his return to the United States he had various assignments in connection with river and harbor improvements in the South until 1891, when for four years he was similarly engaged in New England, then was detailed to the Ohio River Basin, 1897-1901. He served as division engineer of Northwestern and Western United States, 1905-08, in the latter year being appointed president of the Mississippi River Commission, where he soon was recognized as a flood control expert. General Bixby became Chief of Engineers, U. S. Army, June 10, 1910, serving until Aug. 11, 1913, when he was retired. In 1912 he supervised the removal of the wreck of the U. S. S., *Maine*, from Havana Harbor. When the United States entered the World War in 1917, he returned to active service and for two years he was again presi-

dent of the Mississippi River Commission, and division engineer of the Western Division of River and Harbor Improvements. In 1912 he was president of the Congress of the International Association of Navigation Congresses held at Philadelphia, and in 1917 he was elected president of the American Society for Testing Materials.

BLACK TONGUE IN DOGS. See PELLAGRA.

BLASCO IBANEZ, bläs'kō ēbā'nyāth, VINCENTE. Spanish novelist, journalist, and politician, died at Mentone, France, January 28. He was born at Valencia, Spain, Jan. 29, 1867. He studied law in early manhood, but gave up his legal career for the pen and political agitation. He inherited a tendency toward radicalism; his father was the editor of a Republican paper, *El Pueblo*, in opposition to the monarchical régime in Spain. In his youth Ibañez was politically and philosophically turbulent, and was frequently arrested and condemned to imprisonment. Before 1913 he was recognized as being beyond dispute the head of the younger school of novelists in Spain, and he was called frequently "the successor of Hugo and Zola." Like the French novelists, he divided his time between his writing desk and the political pulpit, and, like them, he was fervid in his opposition to the régime in his own country. At first he directed his attacks against the Government of King Alfonso XIII. Later, when Primo de Rivera assumed power as the dictator of Spain, Ibañez turned his heavy guns upon the new system.

In the meantime, his fame as a writer grew. His novel, *La Barraca*, is a powerful and gripping tale, and if the books that succeeded it immediately were not considered its equal, still his art improved constantly. *La Catedral*, *El Intruso*, *La Bodéga*, and *La Maja Desnuda* were successful in the Spanish-speaking countries. In 1918 came the English translation of *The Four Horsemen of the Apocalypse*, dealing with the World War and containing bitter attacks on the Germans. It was extraordinarily popular in the English-speaking world, and may be said to have made Ibañez a figure of world-wide prominence. The motion picture made from the book also carried the world by storm. The story brought in its train, necessarily, English translations of other Ibañez books, but none of them attained its vogue. However, *Mare Nostrum*, both book and film play, dealing with the naval and submarine aspects of the War, added to the fame and the coffers of Ibañez. His *Blood and Sand*, treating of the bull ring, was very successful on the screen. Other works that were done into English were *Torrent* (1923) and *The Temptress*. There is fairly general agreement among critics, however, that the works of Ibañez, temporarily popular, are not permanent literature.

From the Autumn of 1924 until his death Ibañez, who had traveled extensively and had visited the United States, found it expedient to live at Mentone, France; the virulence of his attacks on the Government gave ground for belief that his liberty, if not his life, would be endangered by continued residence in his native country.

BLEIBTREU, blīp'troi, CARL. German poet, critic and dramatist, died at Zurich, January 30. Born at Berlin, Jan. 13, 1859, the son of Georg Bleibtreu, the painter, he studied at Berlin and at London. After doing editorial work

for several years, he published an essay, *Revolution der Literatur* (1886), which, with its praise of the modern school of writing, marked him as a leader of the naturalists. His later books increased his reputation, and he and Friedrich Nietzsche were considered leaders in the modernistic development of German literature. He wrote forcefully on a variety of subjects, stressing his own personality. Although he did certain passages exceptionally well, such as descriptions of battle scenes, many critics consider that he never wrote an artistically balanced book. He was one of the founders of the Freie Bühne, 1889, modeled after the Paris theatre, and a student of Shakespeare. *Dies Irae, Erinnerungen eines französischen Offiziers an Sedan* (1884), was one of his earliest books. His novels include: *Schlechte Gesellschaft* (1885); and *Grössenwahn* (1888). He also wrote plays, notably: *Lord Byron* (1886); *Karma*; and *Weltgericht*. His *Geschichte der englischen Literatur*, first published in 1885, was issued in a revised edition in 1923, and in 1890 he published *Kosmische Lieder*. His more important histories and military books are *Geschichte und Geist der europäischen Kriege unter Friedrich den Grossen und Napoleon* (1892); *Zur Geschichte der Taktik und Strategie* (1897); *Geschichte der deutschen Literatur* (1911); *England Waterlooölge* (1915); and *Stegemanns Weltkrieg und die Marneschlacht* (1916).

BLIND, SCHOOLS FOR. See EDUCATION.

BLINN, HOLBROOK. American actor and producer of plays, died at Croton-on-Hudson, N. Y., June 24. He was born at San Francisco, Calif., Jan. 23, 1872, and after studying at Stanford University made his professional debut in *The New South*, at San Francisco. He appeared first at New York in the same play in 1893. Later he returned to California, organized his own company, and took it to Alaska. In 1897 he went to London to appear in *The Cat and the Cherub*, in which he had played in New York. He achieved popularity in England, and remained there nine years, with brief visits to the United States. In 1920 he originated the part of Pancho Lopez, in *The Bad Man*, his greatest success, and he appeared in this play at New York and on tour for three years. In 1923-24 he appeared in moving pictures, and returned to the stage to star in *The Dore*, 1925-26. Mr. Blinn was also active as a producer of plays and as head of the Actors' Fidelity League.

BLOCK SIGNALS. See RAILWAY ACCIDENTS; RAILWAYS.

BLOOMFIELD, MAURICE. American philologist and Sanskrit scholar, died at San Francisco, June 12. He was born at Bielitz, Austrian Silesia, Feb. 23, 1855, went to America as a boy, and studied at the University of Chicago, Furman University, Yale, and Johns Hopkins, receiving his Ph.D. from the last-named institution in 1879. He was made a fellow of Johns Hopkins, 1878-79, and then studied at Berlin and Leipzig, 1879-91. On his return to America in 1881 he received an associate professorship at Johns Hopkins, and afterward was appointed to the chair of Sanskrit and comparative philology, which he held until his retirement in 1926. He received the degree of LL.D. from Princeton University in 1896 and from Furman University in 1908; that of L.H.D. from the University of

Chicago in 1916, and was made a doctor of the University of Padua, Italy, *honoris causa*, in 1922. The Royal Academy of Sciences of Munich, Bavaria, conferred on Dr. Bloomfield the Hardy Prize in 1908. He was a member and an officer of many learned societies. He wrote, besides numerous papers for journals and reviews, the following: *The Atharva-Veda* (1899); *Cerberus, the Dog of Hades* (1905); *A Concordance of the Vedas* (1906); *The Religion of the Veda* (1908); *Rig-Veda Repetitions* (2 vols., 1916); *Life and Stories of the Jaina Savior Parvvanatha*. He edited for the first time, from original Sanskrit manuscript, the *Grihyasamgraha* of Gobhila-putra, and the *Sutra of Kaṇḍika*, translated the *Atharva-Veda* for the *Sacred Books of the East* (edited by Max Müller), and edited, with Prof. Richard Garbe of the University of Tübingen, the *Kashmirian, or Paippalada Veda* (1901).

BLUE, VICTOR. Rear admiral, U. S. N., retired, died near Lannin, S. C., January 22. He was born in Richmond County, North Carolina, Dec. 6, 1865. He was graduated from the U. S. Naval Academy in 1887. In 1898, the year of the Spanish-American War, he was serving on the *Suwanee*, stationed off Santiago, Cuba, with the rest of the American fleet that was blockading Admiral Cervera's ships. Blue's exploit in going ashore and ascertaining the number and positions of the Spanish vessels made him famous and won for him advancement and a medal. He was promoted through the various grades until he reached the rank of the rear admiral Apr. 1, 1919, and he retired July 11, 1919. In the World War he commanded the battleship, *Texas*, under Admiral Beatty, in the North Sea. For his services in the War he received the Distinguished Service Medal and the decoration of the Belgian Order of Leopold. Before the War he had been chief of the Bureau of Navigation, U. S. N., and he was reappointed to the same post in December, 1918.

BOGDANOFF, ALEXANDER ALEXANDROVITCH. Russian scientist, died at Moscow, April 8. His real name was Malinovski. He was educated as a physician and began practice at Moscow, but soon became active in the dissemination of liberal political ideas. He was exiled to Vologda for three years, and then left Russia. During the revolution of 1905 he was again active in Russia and after the failure of the movement went abroad again with Lenin, Lunatcharsky, and others. He was at variance with some of the ideas of Lenin, and in 1923 was arrested for opposition to the "new economic policy" of the Russian leader. He was later released, and was appointed to the directorship of the State Scientific Institute for Blood Transfusion. He died from the effects of an experiment made upon himself.

BOHE'MIA. A constituent member of the state of Czechoslovakia since the defeat of the Central Powers in 1918; formerly a crownland of Austria; situated in the northwestern part of the former Austro-Hungarian Empire, with Saxony and Silesia on the north, Moravia on the east, and Lower and Upper Austria on the south. Area, including the small Austrian and German territories which were added by the peace treaty to Czechoslovakia, 20,102 square miles; population, Feb. 15, 1921, 6,670,582. Bohemia is represented in the Czechoslovak legislature by nine deputies and five senators. See CZECHOSLOVAKIA.

BOHNKE, EMIL. A distinguished German conductor, died in Berlin, April 10. He was born at Zdunska Wola, Poland, Oct. 11, 1888, but studied at the Leipzig Conservatory under Sitt and Krehl, and at the Akademische Meisterschule in Berlin. For two years he taught at Stern's Conservatory and played the viola in the Bandler Quartet, and later in the Busch Quartet. From 1922 until his death he was conductor of the Berlin Symphony Orchestra. As a composer he attracted attention with a *Symphonic Overture*, *Theme and Variations* for orchestras, a *Violin Concerto* in D, a *String-Quartet* in C minor, a violin-sonata, a cello-sonata, and pieces for piano.

BOILERS. The trend toward larger steam boiler units, so apparent for several years prior to 1928, continued. Boilers rated at over 800,000 pounds of steam per hour were being built and it was confidently expected that these would be able, under forcing, to produce over a million pounds of steam per hour. These units were to go into the East River Station of the New York Edison Co. Furthermore, it was possible under very high rates of steaming to maintain efficiencies of 90 per cent and over. The record to the end of 1928 was slightly over 93 per cent.

Heat releases in stationary practice up to 50,000 B.t.u. per cubic foot of furnace volume were attained during the year and 30,000 to 40,000 B.t.u. were not unusual. Sustained high furnace temperatures were made possible through the use of large furnaces surrounded completely with water walls or a combination of water walls and refractory surfaces. The water walls, by withstanding better the slagging action of the ash, reduce furnace maintenance. They also absorb the large quantities of radiant heat. In some cases the high rates of heat absorption with the resulting high steam and water velocities within these walls has caused circulation difficulties with consequent burning of the water-wall tubes. Altered designs were overcoming this difficulty.

Although about half the water-tube boilers being built had some form of water walls, the air-cooled walls were being employed extensively where the boilers are not forced at such high rates. The heat from these walls goes to preheat combustion air and where powdered coal with unit mills is employed this heated air dries the coal within the mill.

The general employment of bled steam from the turbine to heat the feed water and the higher exit temperatures of the gases leaving the boiler have led to more extensive use of air preheaters to utilize the heat in the uptake gases. In some cases these air preheaters were installed in series with an economizer. Recently a new type, the steaming economizer, had been introduced which is located below the boiler water level with the water flow upward. The use of water walls, air preheaters, and economizers has made necessary a complete reapportioning of heating surface of the steam generating unit, with the result that there is a tendency to place less surface in the boiler proper. It is now common to find twice as much surface in the preheater as in the boiler.

High rates of steaming and high pressures have made it necessary to have as nearly pure feed water as possible. This has led to a more extensive use of evaporators for supplying make-supplied by steam bled from the turbines. Also in some industrial plants where steam is exhausted up water to boiler feed. These evaporators are

ed or bled for process, the returns are likely to become contaminated; hence not suitable for boiler feed. Therefore, in order to minimize the raw water makeup for boiler feed, the bled or exhaust steam is led to an evaporator which produces low-pressure steam for process and the clean condensate from the higher pressure side goes back to the boiler.

For pulverized coal, the slagging type of furnace introduced about two years previously had proved a satisfactory method of disposing of the ash. In this the ash is maintained in a molten state in the furnace well and tapped out daily. A system of water jets cools and shatters the slag which is then sluiced away to a fill. This system was being employed at the Charles R. Huntly Station at Buffalo and at the Toronto Station. It is applicable where the firing temperature of the ash is not too high. Hydraulic sluicing of ash was also extensively employed with the regular type of furnace.

More than half the ash with pulverized coal goes up the stack in a very fine state. This presented a vexing problem in some localities. Various means of arresting this ash were being employed, including electrical precipitation, cyclone separators, and specially constructed exhaust fans. Wear on the blades of the latter necessitated employment of special metals such as stellite for the fan blades.

With high-pressure boilers 700 pounds was considered about the limit in which riveted drums could be employed owing to the difficulty of handling the necessarily thick plates. Above this, forged drums were used. The largest of these to the end of 1928 were the 1400-pound drums built for the boilers at the Deepwater Station near Wilmington. These drums are 50 feet, 3 inches long, 52 inches inside diameter, and have walls 4 inches thick. Steel containing a small amount of manganese (0.30 to 0.45 per cent) is employed.

For further discussion of high steam pressures, see STEAM POWER PLANTS, STEAM.

Automatic combustion control of boilers was more extensively applied during the year not alone on the boilers of large central stations but in many industrial plants as well.

An entirely new design of mercury boiler went into operation at the South Meadow Station of the Hartford Electric Light Company during the latter part of 1928. This was a unit supplying a 10,000-kilowatt mercury turbine and embodied refinements found necessary by experience with the earlier and smaller unit at the Dutch Point plant of the same company.

Three different companies were carrying on experiments with diphenyl as a substitute for mercury in the binary cycle for the production of steam. No conclusive results were available.

BOKANOWSKI, MAURICE. French lawyer and minister of commerce and aviation, was killed in an airplane accident September 2, near Toul, France. He was born at Havre, Aug. 31, 1879. Having studied law and been admitted to the Paris bar, he practiced at the court of Appeals, at the same time taking an active interest in politics. In 1914 he was elected deputy of the Seine. During the World War he served in the French Army and was decorated with the Legion of Honor and the Croix de Guerre. After the War he recommenced his political activities, being again elected to the Chamber of Deputies in 1919, where he distinguished

himself as reporter of the Budget Commission. M. Bokanowski, who belonged to the Bloc National and was an ardent supporter of Poincaré, was appointed Minister of the Navy in the Premier's spring cabinet of 1924. In September of the following year he came to Washington, D. C., with Caillaux, as a member of the debt settlement commission. When Poincaré resumed his position at the head of the Government in 1926, he appointed M. Bokanowski Minister of Commerce and Aviation, in which office he had acted until his death, having made plans for a commercial air service between France and Africa and South America. He visited the United States in 1927 as guest of the American Bar Association, to advocate Briand's plan for the outlawing of war.

BOKHARA, bo-ká'rá. A state in Central Asia, formerly a dependency of the Russian Empire, later known as the Bokharan People's Republic, and since February, 1925, a part of the Soviet Socialist Republic of Uzbek. It is bounded on the north by the Russian provinces of Samarkand and Syr-Daria; on the south by Afghanistan; on the southwest by Transcaucasia and Khiva; and on the east by Ferghana. Estimated area, 79,000 square miles; estimated population, 3,000,000. The chief towns with their estimated populations are Bokhara, 75,000, and Karshi, 25,000. The religion is chiefly Mohammedan. The chief products of Bokhara are corn, fruit, silk, tobacco, cotton, hemp, and farm animals; and the chief minerals are gold, salt, alum, and sulphur. The trade is mainly with India to which raw silk is exported and from which tea, indigo, Dacca muslin, etc., are imported. By the revolution of Aug. 30, 1919, the Amir was dethroned and the Soviet Government was set up, which formed a military and political agreement with Russia. In February, 1925, Bokhara and Khiva were joined together to form the Soviet Socialist Republic of Uzbek.

BOLIVIA. A South American republic situated in the interior and bounded by Brazil on the east and Chile on the west. Sucre is the seat of the supreme court and is historically regarded as the capital, but the actual seat of the government and the largest city is La Paz.

AREA AND POPULATION. Estimated figures for the area and population of Bolivia, place the latter at 2,599,000, as against 1,796,500, the population shown by the official census, taken in the latter part of 1900. The area of the Republic is given as 787,000 square miles. In 1926 the estimated population of La Paz was 109,750. Other large towns with their estimated populations were: Cochabamba, 31,500; Potosi, 30,700; Sucre, 30,200; Oruro, 32,200; and Santa Cruz, 26,500.

EDUCATION. Elementary education is free and compulsory and is under the care of the municipalities and the state. In 1926 there were 1598 elementary schools with 2765 teachers and 79,973 pupils. For secondary education there were 27 colleges (17 national), 5 church institutions, and 5 private schools with 403 teachers and 4213 students. For special instruction there were 22 establishments with 177 teachers and 1913 students. At Sucre and La Paz are the only two universities which possess more than one faculty. There are also a number of training colleges for teachers.

PRODUCTION AND COMMERCE. The outstanding features of Bolivian economic life are the enor-

mous preponderance of the mining industry, and the striking inadequacy of the transportation system, owing to the great geographical and topographical difficulties which beset road building in the republic. Mineral exports, consisting chiefly of tin, have constituted over 90 per cent of Bolivia's total exports since 1920. The tin industry is comparatively recent, and was established during the last century when declining silver production focused attention upon the tin deposits as a source of revenue. The price of tin is the barometer of Bolivian prosperity, notwithstanding the fact that other minerals, notably silver, gold, lead, bismuth, zinc, antimony, tungsten, and nickel are also produced. Of these, antimony is of particular potential interest in view of its position as a possible check on world antimony prices, Bolivia being the chief source of supply outside of China. The production of lead has shown a considerable increase owing to the greater demands for this metal in the automobile, radio, and cable industries.

Agriculture is relatively unimportant and cultivation methods have improved but little since primitive times. Rubber was at one time one of Bolivia's chief exports, but the demand has fallen with increasing development of the East Indian product. Oil is found in various parts of the Republic but is undeveloped. Forest resources are abundant but the lack of transportation facilities and the fact that the natural river systems flow away from the Pacific coast prevent any marked exploitation. Coal is too costly for general use, native fuels are poor and the vast potential hydro-electric resources lie undeveloped. This lack of fuel has been a sharp deterrent to the establishment of various industries, notably smelters and refineries.

The purchasing power of the country is extremely limited; the population, predominantly Indian and mestizo, has a small earning capacity. The Indians buy few imported goods. It is estimated that not over 10,000 families have incomes exceeding \$1800 a year and that less than 100 families have incomes exceeding \$15,000.

The total value of all exports in 1927 was \$43,704,000 of which \$3,665,000 went to the United States. The minerals comprised 92.6 per cent of all the exports. Among the more important minerals were: Tin, 33,858 long tons valued at \$33,649,000; lead, 25,003 short tons valued at \$1,651,000; copper, 7850 short tons valued at \$1,676,000; silver, 5,403,000 troy ounces valued at \$3,063,000. The rubber exports consisted of 8,517,000 pounds valued at \$1,765,000.

The total value of all imports in 1927 was \$22,733,000, of which \$6,561,000 represents the share of the United States. Great Britain, Germany, and France were the next in importance as sources of origin for imports. In 1914 Bolivia, cut off from England, its principal export market, diverted its trade to the United States; and in 1927, although it had regained its export market in England, it purchased 28.9 per cent of its requirements in the United States, as against 19 per cent from England. Germany has never recovered its pre-war position in the Bolivian import trade, but France has made a slight gain.

FINANCE. The national budget for 1928 was approved in the following form: Receipts, 51,-

897,187 bolivianos; expenditures, 55,802,973 bolivianos; deficit, 3,905,786 bolivianos. In order to cover the deficit, the president was authorized to make reductions not exceeding 15 per cent in all branches of the Government. The expenditures were divided as follows: Legislative power, 796,122 bolivianos; foreign relations, 1,050,010; worship, 164,840; government, 2,575,570; justice, 2,080,242; treasury, 2,498,005; industry, 521,245; public debt, 25,823,545; promotion, 1,152,367; communications, 2,237,221; education, 5,000,411; agriculture, 199,520; war, 10,939,760; colonization, 764,114. The total public debt of Bolivia on June 30, 1927, was 172,544,762 bolivianos, distributed as follows: External debt, 132,176,501 bolivianos; internal debt, 22,065,683 bolivianos; floating debt, 18,302,578 bolivianos. Naturally these figures do not include a loan of \$23,000,000 floated in September, 1928, which, however, was largely for refunding purposes.

In April, 1928, the Bolivian Senate, after slight amendments, approved the three financial bills laid before the Government by the Kemmerer Financial Mission (consult preceding YEAR BOOK), and which had already been passed by the Chamber of Deputies. The first law provides for a tax on real estate; the second provides for the establishment of a national company for revenue collection; and the third provides for taxes on certain kinds of income.

COMMUNICATIONS. As noted above the transportation system of Bolivia is the chief hindrance in the way of greater economic exploitation. The length of railways at the end of 1926 was 1244 miles and the length of highway at the end of 1927 was 1125 miles. In 1927 there were 7150 miles of telegraph wire and 3589 miles of telephone wire; in 1928 there were 1985 automobiles registered.

In accordance with the treaty signed on Oct. 20, 1904, by the diplomatic representatives of Chile and Bolivia, the Bolivian section of the Arica-Alto de la Paz Railway was turned over to Bolivia on May 13, 1928. The railway, a daring and impressive work of engineering which surmounts the Andes, was built by an English company, which began work in 1909 and concluded its task in four years at a total cost of £4,063,561 for 446 kilometers on Chilean soil, and £1,105,000 for the 240 kilometers on Bolivian territory. During the 15 years since its completion the railroad has carried 1,500,000 tons of freight. Chile was to continue to manage the Bolivian section until certain arrangements could be made, the revenue being divided 60 per cent to Chile, and 40 per cent to Bolivia.

On May 19, 1928, the ceremony initiating the work for the construction of the Cochabamba-Santa Cruz Railway was presided over by President Siles. Upon completion, this railway was to connect the productive regions of the highlands with the Bolivian Orient of great agricultural wealth.

GOVERNMENT. The President, who is elected by direct popular vote and is ineligible for reelection, is the head of the executive department, and is aided by a cabinet of six members, each in charge of a separate department. Legislative power is vested in a congress of two chambers, the senate of 16 members elected for six years, and the chamber of deputies of 75 members elected for four years. One-third of

the senate and one-half of the chamber retire every two years. President in 1928, Dr. Hernando Siles, assumed office Jan. 10, 1926, for the period 1926-1930.

HISTORY. Bolivia passed through a rather eventful year, both as far as internal conditions were concerned and in her relations with her neighbors, particularly Paraguay. In the early part of the year there was a political plot involving many members of the Senate and Chamber of Deputies to overthrow the government of President Siles. Before the plot could come to a head, agents of the President unearthed it and many of the leaders were arrested and exiled. The only concrete result of the movement was the reorganization of the president's cabinet, which formed as follows: Foreign Affairs, Dr. Tomás Manuel Elío; Government and Justice, Minor Gainsborg; Treasury, Adolfo Costa; Interior and Communications, Carlos Romero; Public Instruction and Agriculture, Félix A. del Granado; and War and Colonization, Dr. Felipe Guzmán.

The outstanding feature of Bolivia's history during the year, was, of course, her break with Paraguay in December, because of the failure to settle the boundary dispute between the two countries. The boundary dispute was of more than 100 years standing between the two countries and involved an area of approximately 100,000 square miles in the very heart of South America. Strange to say, the territory in dispute has not much of an economic value, being very swampy and almost inaccessible. During the year the two countries were apparently making a sincere effort to settle the matter by arbitration. Reports were published from time to time in the press to the effect that the mixed boundary commission in Buenos Aires was unable to agree on any working basis because of incomplete instructions from the two governments involved.

In the meantime reports were also rife that both sides were arming and were prepared to settle the matter on the battlefield. Although these rumors were stoutly denied, there seemed to be some truth in them at least as far as Bolivia was concerned. The matter came to a head in the form of a serious crisis when there was a clash between the armed forces of the two countries on December 6. The press reported that Paraguayan soldiers fired on some Bolivian soldiers who were discovered building a fort in the disputed territory. Intense excitement immediately prevailed throughout the two countries and the rest of the world was disturbed by the war clouds which were hanging so obviously and ominously over the horizon of South America. On December 8, Bolivia severed diplomatic relations with Paraguay and a decree issued by President Siles suspended the municipal elections which were to be held on the next day in light of the international complications. The capital, La Paz, seethed with patriotic demonstrations and war was imminent.

Fortunately the Washington Pan-American Conference was in session and took immediate action by the appointment of a commission by Mr. Kellogg. The League of Nations also acted through Aristide Briand, who cabled to each of the countries involved to the effect that the League's Council did not believe that the incident would be allowed to become serious.

These efforts toward achieving peace did not seem, at first, to be of much value. Both coun-

tries withdrew from the Washington Conference and intimated that the time for arbitration had passed. The League of Nations merely marked time because of the provision in the Covenant which forbids interference wherever the Monroe Doctrine is concerned. The only hope appeared to rest with the Pan-American Conference at Washington. This body offered its good offices through the committee whose appointment was noted above. On the last day of the year it was announced that Bolivia had agreed to accept in principle the protocol of conciliation which she had been asked to by the Washington Conference. Five countries were asked to appoint members of a commission of investigation to look into the Chaco boundary dispute. They were Argentina, Brazil, Cuba, Uruguay, and the United States.

As Paraguay had previously taken steps to accept the protocol of conciliation, the year closed with the war clouds considerably cleared up. By signing the protocol, it was expected that both countries would pledge themselves to cease warlike measures until the matter is settled satisfactorily to both sides. There seemed to be a bit of dissension as to the scope of the investigating commission. Bolivia wished it to limit its study to the attack on Fort Vanguardia on December 6, while Paraguay wanted it to cover a much broader scope and to go into all recent incidents and fix the responsibility therefor. Nevertheless, hope was bright for a settlement of the controversy.

BONE, JOHN RAINSFORD. Canadian journalist, died at Toronto, Ont., June 7. He was born in Huron County, Ontario, in 1877, and was graduated from Toronto University in 1899. In the following year he became a member of the editorial staff of the *Star*, of Toronto, advancing to the post of assistant managing editor in 1906 and to that of managing editor in 1907. He was a past president of the Canadian Press Association.

BOOTLEGGING. See **PROHIBITION**.

BOOTS AND SHOES. Although production in the boot and shoe industry started the year on a reduced basis, output increased towards spring and early summer, and about August 1 there was a noticeable improvement which continued until late autumn, when price reduction had an unsettling effect. The situation at the end of the year was characterized by more settled conditions, with firmer markets in all lines, and indications for broader operations in 1929. Prices were necessarily in line with higher hide and leather markets, while handicaps in the movement of retail stocks earlier in the year were the late spring and some resistance to prices by manufacturers. See **LEATHER**.

According to the U. S. Department of Commerce a total production of 344,350,724 pairs of boots and shoes other than rubber was reported for the year 1928, or an increase of less than 1 per cent over the production for 1927, namely 343,605,905 pairs, and to be compared with 324,513,595 pairs for 1926. The output of women's leather boots and shoes increased 6.4 per cent; athletic and sporting shoes (principally men's), 4 per cent; shoes with satin, canvas, and other fabric uppers (principally women's), 13.9 per cent; and slippers for house wear, 8 per cent. There was a decrease of 4.6 per cent in men's leather boots and shoes; 4.9 per cent in boys and youths' shoes; 6.3 per cent in misses and

children's shoes; 2.9 per cent in infants' footwear. The table below indicates the distribution of the production as compared with 1927.

UNITED STATES PRODUCTION OF BOOTS AND SHOES

Kind	Number of pairs	
	1928	1927
Boots and shoes, total	344,350,724	343,605,905
High and low cut (leather), total	298,724,547	300,007,772
Men's	90,969,621	95,328,098
Boys' and youths'	23,031,757	24,229,296
Women's	123,752,653	116,253,866
Misses' and children's	37,135,374	39,648,961
Infants'	23,885,142	24,541,551
Athletic and sporting (leather)	1,547,064	1,488,215 ^a
Satin, canvas, and other fabric ^b	3,760,069	3,301,433
Slippers for house wear, total	31,483,157	29,158,122
All leather	6,825,897	5,085,294
Part leather, felt, etc.	24,657,260	24,072,828
Moccasins	1,253,198	(^c)
Barefoot sandals and play shoes	5,682,099	(^c)
All other footwear	1,900,590	9,650,363

^a Revised.

^b Excludes footwear with rubber soles.

^c Included with "All other footwear."

As usual Massachusetts occupied first rank as a producer with a total output of 83,310,625 pairs; followed by New York with 74,800,641 pairs; Missouri with 46,060,389 pairs; Illinois with 25,246,250 pairs; New Hampshire with 21,499,436 pairs; Maine with 17,069,770 pairs; Wisconsin with 17,058,663 pairs; Pennsylvania with 16,662,134 pairs; Ohio with 15,324,137 pairs; and all other States with 27,318,679 pairs.

In 1928 there was an increase over 1927 of the number of shoes imported into the United States and a decrease in the number exported. The imports were as follows: all-leather boots and shoes, 2,616,884 pairs valued at \$8,254,224 in 1928, compared with 1,477,435 pairs valued at \$5,199,656 in 1927, an increase of 77.1 per cent; all-leather slippers, 633,998 pairs, valued at \$1,019,435, compared with 460,073 pair valued at \$407,407 in 1927; and other footwear, 1,170,953 pair valued at \$316,193, as compared with 1,066,331 pair valued at \$311,303 in 1927. Fewer shoes of certain types were exported from the United States in 1928 than in the previous year, the exports being men's and boys', 1,870,493 pair valued at \$5,796,517 in 1928, as compared with 2,477,117 pair valued at \$7,042,886 in 1927; children's 666,435 pair valued at \$750,199, as against 1,139,479 pair valued at \$1,170,255; and athletic shoes, leggins, and other footwear, 62,555 pair valued at \$93,964, as compared with 73,619 pair valued at \$113,864. The value, however, of women's shoes and slippers exported increased; 1,783,342 pair of women's shoes valued at \$4,309,877 were exported in 1928, compared with 1,897,478 pair valued at \$4,276,939 in 1927; and 361,500 pair of slippers valued at \$392,099, compared with 281,560 pair valued \$295,924. These figures are of interest because, during 1928, the leaders of the shoe industry urged increased tariff protection.

BOR'NEO. An island in the Malay Archipelago. See **BRITISH NORTH BORNEO**, **BRUNEL**, **SARAWAK**, and **DUTCH EAST INDIES**.

BOS'NIA AND HERZEGOVINA, hër'tsã-gö-vë-na. Formerly provinces in the Turkish Empire; now provinces of the newly established State of Jugo-Slavia. In 1908 control over them was acquired by the Austro-Hungarian Empire.

In 1918 after the collapse of this empire they were turned over to Jugo-Slavia. Area, 19,768 square miles; population, according to the census of Jan. 31, 1921, 1,889,929. See JUGO-SLAVIA.

BOSTON MUSEUM OF FINE ARTS. See ART MUSEUMS.

BOSTON UNIVERSITY. A non-sectarian institution of higher education at Boston, Mass., founded in 1869. The enrollment for the autumn term of 1928 was 12,234, distributed as follows: College of liberal arts, 867; college of business administration, 3778; college and extension courses, 918; college of practical arts, 915; college of music (new in 1928), 148; school of theology, 260; school of law, 569; school of medicine, 216; school of education, 2155; school of religious education, 471; graduate school, 562. Of the total registration, 8250 were full-time students working for degrees, and 3714 part-time, special students. The summer session enrollment was 10,084, of whom 5072 were men, and 5012 women. The faculty members numbered 463 in the autumn of 1928, administrative officers, 212, and trustees and council members, 65. In the eight libraries of the University there were 150,000 volumes, the liberal arts library, alone, containing 42,154. Among the important gifts received during the year was a 24-acre recreation centre at Riverside, in suburban Boston, from William E. Nickerson. Nickerson Field was developed and includes a football gridiron; baseball diamond; archery field; girls' hockey field; 12 tennis courts; running tracks; a boathouse with free canoes for students, and facilities for student dances; a field house for visiting teams; club rooms; ice-hockey rinks and toboggan chutes. The productive funds of the University exceeded \$3,000,000. President, Daniel L. Marsh, S.T.D., LL.D., Litt.D.

BOTANY. The eighty-fifth annual meeting of the American Association for the Advancement of Science was held in New York City, Dec. 26 to 31, 1928, with about 45 affiliated societies. Botany was represented in the meetings of Section G and in more than a dozen of the affiliated societies. The British Association for the Advancement of Science met at Glasgow, September 5 to 12; the French Association at LaRochelle, July 23 to 28, and the Swiss Society of Natural Sciences at Lausanne, August 30 to September 2. The Southwestern Division of the American Association for the Advancement of Science met at Flagstaff, Arizona, April 23 to 26. The Pacific Section of the American Botanical Society and the Pacific Division of the American Phytopathological Society met at Pomona College, Claremont, California, June 13 to 16, 1928. Botanical papers were presented at all of these meetings.

PHYSIOLOGICAL STUDIES. Baly, in an address before the Royal Institution of Great Britain, described experiments conducted in his laboratory on the synthesis of carbohydrates from carbon dioxide (*Science*, 1928, p. 364). A large surface of a specially prepared aluminum hydroxide in an aqueous suspension was submitted to visible light in the presence of carbon dioxide with the result that a photosynthetic syrup was formed that is considered to be a mixture containing glucose or fructose, or possibly both. Other more complex carbohydrates were formed that were readily reduced to simple sugars by the action of dilute acids. When equal areas of living leaves and areas of the suspended metals in glass vessels were compared, the quantities of carbohy-

drates synthesized were equal. Armstrong also reported that Pictet and Vogel had accomplished the synthesis of cane sugar in their laboratory (*Nature*, 1928, p. 578). This would indicate progress in our knowledge as to how the plant builds up its body from inorganic materials.

It had been claimed that, by increasing the amount of carbon dioxide in the air, plant growth would be stimulated, and experiments by Bolas and Henderson show that the growth of cucumber plants was increased by the artificial enrichment of the air with carbon dioxide. Willaman and Beaumont found that the respiration of dormant buds, tubers, and seeds was not increased with the increase in carbon dioxide unless the plant material was aspirated. When this was done there was a marked increase in respiration. Meyer and Plantefol claimed that the respiration of plants was not influenced by increasing the carbon dioxide of the air to 5 per cent. There was a decided reduction of respiration if the water content was lowered, and it was concluded that chlorophyll assimilation is more closely correlated with imbibition than with respiration. While most plants apparently require oxygen in their photosynthetic activities, Harvey claimed that certain marine algae can carry on their activities in complete absence of oxygen if kept in an atmosphere of carbon dioxide and illuminated (*Pl. Physiol.*, 1928, p. 85).

Investigators in many lands confirmed the general conclusions of Garner and Allard regarding the effect of length of daily illumination on the growth of plants and their flower production (*YEAR BOOK*, 1920, p. 93). In general, all green plants appear to have optimum requirements of light for their growth and reproduction. Experiments by Lubimenko and Szeglova (*Rev. Gen. Bot.*, 1928, p. 490) indicated that shortening the photoperiod reduced the formation of carbohydrates and consequently the vegetative growth. Lengthening the period of illumination resulted in prolonged vegetation and reduced reproduction. Intensity of light was found more necessary for flowering and fruiting than for growth and increase in dry weight, and from the results of their experiments it is concluded that some other factor than length of day may be involved in fruiting. They found in their experiments, which were carried on at Leningrad, that for normal growth tropical plants require a short photoperiod, temperate zone plants, one of from 9 to 18 hours, and subarctic plants, the longest period available. The physiological differences between short- and long-day plants are held to be due to differences in the relative rates of oxidation (respiration) and reduction or photosynthesis.

Tincher, in recent work, found that the shortening of the length of day from the normal period resulted in reduced stem elongation and retarded flowering. He considers the length of day factor governs the utilization of the carbohydrates made by the plants, hence influences stem elongation and the carbon-nitrogen ratio in the body of the plant (*Ann. Bot.*, 1928, p. 101).

Some recent experiments carried on by the U. S. Department of Agriculture with long- and short-day plants receiving 12 hours of illumination that were broken into alternate periods of light and darkness showed that as the length of the periods of equal light and darkness was progressively shortened, growth was reduced until the alternating periods were about 1 minute

in duration. When further reductions were made, growth was increased, and when the intervals were only five seconds, normal growth was restored. All plants behaved as though exposed to a long day.

An almost revolutionary change was made in the belief that only about a dozen chemical elements are required by plants. Numerous elements often found in plant tissues and formerly believed to be more or less accidentally present are now considered essential for plant growth and development. Just how minute quantities of these substances affect plant growth is not definitely known. Bishop claimed that within limits manganese has a beneficial effect on plant growth, due, he believes, to some relation between the presence of manganese and carbon assimilation (*Brit. Chm. Abstrs.*, 1928, p. 1060). Kleinstuck thought that manganese in plants acts as a catalyst. Willis found that adding a small amount of manganese to certain soils in North Carolina corrected a chlorotic condition of oats and soy beans and caused a resumption of normal growth (*N. C. Exp. Sta. Bull.* 257). Gilbert and McLean reported similar results in the prevention of lime-reduced chlorosis of a number of species of plants by the application of manganese sulphate (*Rev. Appl. Mycol.*, 1928, p. 740).

Lee and McHargue described a serious chlorosis of sugar cane that was cured by dusting the plants with manganese sulphate or adding it to the soil (*Phytopathology*, 1928, p. 775). The same investigators found aluminum in small quantities stimulative of plant growth, although it is highly toxic in high concentrations (*Pl. Physiol.*, 1928, p. 293). Samuel and Piper claimed that the gray speck disease of oats in Australia is due to a manganese deficiency in the soil. Schreiner *et al.*, cured chlorosis in tomatoes, maize, tobacco, etc., in Everglade soil in Florida by adding manganese sulphate to the soil (*Ann. Appl. Biol.*, 1928, p. 469). Sommers and Sorokin (*Pl. Physiol.*, 1928, p. 237) and Johnston and Dore (*Science*, 1928, p. 324) claimed that boron in limited amounts is necessary for plant growth and that its absence is accompanied by abnormal changes in the plant structures and in pathological symptoms. Zinc was also found by Sommers to be necessary for the normal growth of plants in five different families, and it is considered to be essential for the nutrition of all the higher green plants (*Pl. Physiol.*, 1928, p. 217).

On account of its possible application to horticulture, there were a number of experiments reported on breaking of the rest period of plants. Denny and Stanton described their experiments in which the rest period of deutzia, azalea, flowering almond, etc., was broken and flowering hastened by subjecting the dormant plants to vapors of chemicals. The best results were secured with ethylene dichlorid and ethylene chlorhydrin. They claimed that in woody plants, dormancy lies in the buds and it is not distributed throughout the plant (*Amer. Jour. Bot.*, 1928, p. 327). Their investigations were extended to tubers and it was found possible to shorten the rest period of potato tubers by at least one month by soaking the tubers in weak solution of ethylene chlorhydrin or in sodium thiocyanate. Rosa reports similar experiments, and he found that treating large tubers cut before planting gave the best results (*Hilgardia*, 1928, p. 99). This discovery is of practical importance in some regions,

as it will make possible the growing of two crops in one season.

At the 1927 meeting of the American Association for the Advancement of Science, the effect of irradiation on the mutation of plants and animals was announced. Some further work on phases of this phenomenon was reported, and Stadler reports having produced mutations in barley by exposing germinating seeds to X-ray and radium emanations (*Science*, 1928, p. 186). Several investigators reported the effect of irradiation on plant growth. Stoklasa claimed that growth of a number of horticultural plants was stimulated and that there was a greater total weight following the irradiation of the seed (*Gartenbauwiss.*, 1928, p. 149). Johnson found that irradiating sunflower seeds with X-rays retarded germination and growth, the inhibitory effect being in proportion to the exposure (*Amer. Jour. Bot.*, 1928, p. 65). He also reported that irradiating sprouted potato tubers with a light treatment of X-rays before planting resulted in the production of a greater number of tubers per plant, but with a reduced total weight of product (*Science*, 1928, p. 28). Delf and others in England report similar results with the use of the ultra-violet light. Sayre studied the effect of radiant energy on chlorophyll production by seedlings and found that wave lengths beyond 680 μ were ineffective. With equal energy values the red rays were more effective than the green ones, and the green ones more than the blue (*Pl. Physiol.*, 1928, p. 71).

MISCELLANEOUS STUDIES. MacDougal and Brown, continuing studies on the duration of living-ray cells in plants (YEAR BOOK, 1927, p. 120), reported having found living-ray cells in the centre of the trunk of a paloverde tree (*Parkinsonia microphylla*) that from their position must have been three centuries old (*Science*, 1928, p. 447). Molisch reported experiments on the movement of sap in plants that were said to confirm the claim of Bose that sap circulation is a vital and not a physical process (*Nature*, 1928, p. 168). On the other hand, MacDougal offered additional evidence to show that the upward movement of sap in trees is due to tension caused by the evaporation of water by the leaves. The tension is transmitted through the leaf stems and branches to the trunk and down to the roots, which draw upon the water supply of the soil.

Kato and Maruyama claim that it is possible to distinguish different varieties of rice by sero-diagnostic methods (*Jap. Jour. Bot.*, 1928, p. 35), and Satina and Blakeslee have found biochemical differences between sexes in plants (*Nat. Acad. Sci. Proc.* 1927, p. 115). The ability to reduce potassium permanganate and the response to the Manilov reaction (YEAR BOOK, 1927, p. 120) were closely parallel.

Davis reported some interesting correlations between high pressures and the germination of such refractive seeds as alfalfa and sweet clover. Seeds subjected to pressures of 2000 atmospheres for five minutes at a temperature of 18° C., after storing for 30 days gave much higher percentages of germination than untreated seeds. Lower pressures at longer times did not give the same results. Lipman claims the discovery of living organisms in pre-Cambrian and Pliocene rocks. They were grown in cultures, and some are said to possess characters of the Actinomyces group. They are supposed to have remained in the rocks in spore forms (*Science*, 1928, p. 272).

PLANT DISEASES. The season of 1928 was generally favorable for many fungus diseases throughout much of the United States. The rusts of grain caused relatively little loss. On winter wheat, stem rust was almost negligible, and only from 1 to 3 per cent loss was reported from the spring wheat area. Rather heavy infections were found in small areas of Minnesota and South Dakota that are believed to have originated from barberry plants recently discovered in northeastern South Dakota. The campaign for the eradication of the common barberry, which serves as an alternate host for the wheat-stem rust, is being continued, and the light infestation of rust in 1928 is attributed in some degree to the greatly reduced number of barberries.

In 1927, according to *The Plant Disease Reporter*, there was much loss due to stem rust of wheat, from 50 to 75 per cent loss having been reported in parts of Minnesota and northeastern South Dakota. The Red River Valley escaped serious damage, and in the western parts of North Dakota and South Dakota the loss was slight. Formerly all these spring wheat areas suffered severely when conditions were favorable for rust infection. Wheat smut took heavy toll wherever seed treatment had not been adopted. In Illinois, dockage on account of smut was estimated to have been in excess of \$518,000. In Indiana, dockages ranging from 50 cents to \$1 per acre were recorded. Oat smut was reported to have destroyed from 1.5 per cent of the crop in Connecticut, New Jersey, and Idaho to 20 per cent in North Carolina and 35 per cent in South Carolina. These losses are inexcusable as it has been shown that the cereal smuts can be controlled by suitable seed treatments at a very low cost.

During the year the white pine blister rust was found in 16 additional counties in Michigan and in 37 counties in Pennsylvania. In the Pacific Northwest it is now well established in northeastern Washington, Idaho, Montana, and in northern Oregon. Control measures, which involve the destruction of all currant and gooseberry bushes near white pine, have been put into effect in New England and New York, and about three-fourths of the white pine areas in those States have been given protection. Similar control measures are being tested in the Pacific States. Chestnut blight continues to spread in the Southern States, and most of the native chestnut trees in the southern Appalachian region are expected to be killed within 10 years.

The European larch canker (*Dasyscypha willkommii*), first found in America at Hamilton, Mass., in 1927, was considered to be potentially the most dangerous forest-tree disease introduced into this country. It is of the same type as the chestnut canker, and in addition to the larch, the fungus can attack many other coniferous trees. A new disease of Monterey cypress was reported in California. It was caused by a species of *Coryneum*, and the Italian cypress was also subject to attack. Both trees are extensively planted for windbreaks and as ornamentals. An elm disease appeared in western Europe that is quite destructive. The fungus which causes the disease is said to be *Graphium ulmi*, and practically all varieties of elm appear susceptible. A disease of linden trees caused by *Massariella curreyi* was discovered in New Jersey during the summer of 1928. A new and serious disease known as the phony disease of peach has appeared in Georgia.

Little was known as to the cause or nature of the disease, but it had almost completely destroyed a number of large peach orchards.

The cause, host relationships, and means of transmission of the so-called virus or mosaic diseases of plants continue to puzzle investigators in many lands. From the known etiology of some animal diseases certain plant pathologists are seeking for similar explanations as to the cause of mosaic in plants. Iriate has shown the presence of flagellated organisms in various species of Euphorbia and in cassava, but apparently no disease is caused by them. The flagellates were readily transferred by insect carriers to susceptible hosts (*Inaug. Dis.*, 1928). Holmes claimed to have found two types of intercellular bodies associated with mosaic of Hippeastrum, but when photographed with ultra-violet light seven typical species of mosaic plants showed no formal structures that did not appear in healthy ones (*Bot. Gaz.* 86, 1928, p. 59). Goldstein reports the finding of X-bodies in variegated dahlia leaves affected with mosaic, and they are considered to be definite entities and not degeneration products (*Torrey Bull.*, 1927, p. 285). The Connecticut Agricultural Experiment Station reports (*Bull.* 291) the occurrence of definite inclusions in the nucleus of mosaic infected tobacco cells and that the active principle remained effective in tobacco leaves that had been preserved for 24 years in the herbarium. Purdy claims to have transmitted mosaic to detached tobacco leaves with the appearance of characteristic intercellular bodies, and evidence was secured to indicate that the causal agent multiplied in the host tissues (*Amer. Jour. Bot.*, 1928, p. 94).

The interrelations of certain types of mosaic have been extensively investigated. Van der Meulen and Quanger have reported that their experiments show the specialization of certain types of mosaic to certain host plants, which indicates that a definite relationship exists between some of the mosaic diseases and certain crops or groups of plants (*Landbouw.*, 1928, p. 63). In other cases the transfer of the causal agent from one kind of plant to another results in a different type of disease. Bewley and Corbett found that transferring the aucuba and stripe forms of mosaic of tomato to other tomato and tobacco plants resulted in the appearance of either or both forms of disease. Tobacco and tomato plants inoculated with the stripe form of tomato produced typical mosaic. Stripe inoculated into jimson weed produced no form of mosaic (*Rev. Appl. Mycol.*, 1928, p. 748). Smith claimed that the diseases of tomatoes and tobacco known as mosaic and aucuba were quite distinct. It was believed that there were several strains of virus that were capable of producing mosaic diseases of potato (*Ann. Appl. Biol.*, 1928, p. 517). Pole Evans claimed that there were distinct strains of streak, a mosaic disease of sugar cane, maize, and several grasses in South Africa (*Farming in South Africa*, 1928, p. 1087).

Insects appeared to be the principal means of carrying mosaic diseases from plant to plant, and in a number of cases a specific insect acts as the carrier of infection, such as sugar beet curly top, mosaic of sugar cane, a new virus disease of potatoes, rosette of peanuts, maize streak, strawberry yellows, and a virus disease of Bermuda lilies. Various studies have been reported which lead to that conclusion. Atanasoff, however, claimed from studies of infectious mosaic

diseases, that there must be some other agencies than insects which act as carriers of the infection (*Bull. Soc. Bot. Bulgaria*, 1928, p. 50). Valleau found that tobacco mosaic was readily transmitted by laborers chewing infected natural leaf tobacco and spitting in seed beds. Some brands of commercial tobacco and cigarettes were also found to be sources of infection. A number of new infectious mosaic diseases were reported during the past year. Among them were: one of tobacco in Sumatra; the "breaking" of tulips; an infectious chlorosis of roses in New Jersey; a mosaic disease of sugar beets in Germany; a disease of sandal wood in southern India; and a mosaic disease of onions in Iowa.

Profiting by the knowledge gained from studies in genetics, plant breeders were making important progress in the development of resistant strains and varieties of many of the common plants. Some of these have been extensively adopted in general agriculture and horticulture. Many experimenters claimed that resistance could be built up by continued crossing with resistant forms and by repeated selection from among the progenies. A large number of superior strains of wheat, oats, flax, tobacco, potato, tomato, beans, peas, cabbage, etc., had been developed in this manner.

This method of combating plant diseases, although very promising, has its limitations. It has been found that some of the fungi have developed strains, known as physiologic forms, that are capable of attacking certain varieties but not others. Thus there are known to be nearly 60 physiologic forms of wheat stem rust, 8 of which were described from Canada during 1928 by Newton *et al.* (*Sci. Agr.*, 1928, p. 209). Reichert found that durum wheats which are considered quite resistant to wheat bunt in the United States are highly susceptible in Palestine, indicating different physiologic forms in the two countries. Apparently the generalization that there is a correlation between the number of chromosomes in varieties of wheat and their resistance to bunt does not hold in Palestine. Reed reported at least four distinct specialized forms of bunt in the United States as shown by the reaction of the fungus to different varieties of wheat (*Amer. Jour. Bot.*, 1928, p. 157). Gordon has described a new physiologic form of *Puccinia graminis avenae* on oats, making at least six forms that are now known. Dickinson reports having developed four distinct strains of loose smut of wheat from a single spore (*Proc. Roy. Soc.*, 1928, B, p. 547).

NECROLOGY. The year 1928 took heavy toll of the botanists of international reputation. Among those whose deaths were reported were: Dr. H. M. Benedict, professor of botany of the University of Cincinnati, Oct. 17, 1928; Prof. E. S. Burgess, Hunter College, New York City, February 23; Dr. John M. Coulter, founder and editor of *The Botanical Gazette*, and for many years head of the department of botany of Chicago University, December 23; Charles Curtis, former director of the botanic gardens at Penang, Straits Settlements, August 16; Leon Guignard, French botanist, March 7; J. A. Henriques, founder of *Boletim de Sociedade Broteriana*; Dr. W. Johansson, Danish botanist and geneticist, Nov. 11, 1927; Prof. J. E. Kirkwood, professor of botany, University of Montana, Aug. 16, 1928; Dr. J. Matsumura, director of the botanic gardens, Tokyo, May 4; S. B. Parish, well known for his

contributions to the flora of California, June 5; Mrs. Flora W. Patterson, for 20 years mycologist of the U. S. Department of Agriculture, February 5; Dr. H. M. Richards, professor of botany, Barnard College, Columbia University, January 9; Prof. J. Ritzema Bos, Dutch botanist, April 7; Dr. J. N. Rose, associate curator, U. S. National Herbarium, May 4; Dr. F. L. Sargent, formerly professor of botany, University of Wisconsin and later with the Boston Museum, January 16; Capt. John Donnell Smith, intimately associated with reports on the flora of Central America, December 2; Sir W. T. Thisleton-Dyer, for 20 years director of the botanic gardens at Kew, England, December 26; and Sir Henry Wickham, who succeeded in getting Hevea seeds from Brazil in 1876 and thus made it possible to start the plantation rubber industry in southeastern Asia, September 27. Biographical sketches of many of these appear elsewhere in this YEAR BOOK.

NEW JOURNALS. The Botanical Section of the Agricultural Science Committee of the Ukraine began the publication of the *Journal of Agricultural Botany*. The leading articles are accompanied with English or German abstracts. The British Empire Vegetation Committee, appointed at the Imperial Botanical Congress held in London in 1924, arranged with the *Journal of Ecology* to publish supplements giving abstracts of publications pertaining to all phases of botany in the British Empire. See also PHYSICS.

BOULDER DAM PROJECT. See DAMS; NEW MEXICO; UNITED STATES, under *Seventieth Congress. Second Session.*

BOUNDARY DISPUTES. See ARBITRATION, INTERNATIONAL.

BOUVET (bōō'vā') ISLAND. In November, British rights to Bouvet Island in the South Atlantic (Lat. 54°26'S; Long. 3°24'E.) were waived in favor of Norway. Sighted by Lozier-Bouvet in 1739, such explorers as Cook and Ross failed to relocate it. Meanwhile Liverpool, Lindsay, and Thompson islands had been discovered in the vicinity. Finally, the German *Valdivia* Expedition of 1898 located an island at a distance from the one discovered by Bouvet but which was named in his honor. Since Captain Norris in 1825 had sighted Thompson Island and had landed and taken possession of Liverpool Island, the British Government, considering Liverpool Island identical with this second Bouvet Island, in 1928 announced a lease of the whaling rights of Bouvet and Thompson islands. The Norwegian Government pointed out that a Norwegian expedition in the whaler, *Norvegia*, had landed and taken possession of Bouvet Island in December, 1927. Since it was difficult if not impossible, to prove that the present Bouvet Island and the Liverpool Island of Norris were identical and since no further occupation of the island had been made, the British Government recognized the Norwegian claim to Bouvet Island.

BOWDOIN COLLEGE. An institution of higher education for men, at Brunswick, Maine, founded in 1794. The autumn session of 1928 had an enrollment of 559, including: Seniors, 143; juniors, 124; sophomores, 140; and freshmen, 152. There were 52 members on the faculty in the 1928-29 term, of whom eight were appointed after June, 1928. The productive funds of the college amounted to \$4,984,000, and the income for 1927-28 to \$250,000. The library contained 145,000 bound volumes. A swimming pool

costing \$150,000, and a Union building costing \$200,000, were completed in 1928. President, Kenneth Charles Morton Sills, LL.D.

BOWLING. The bowling honors for 1928 rest with Phillip Wolf of Chicago who accumulated a total of 1937 points in the eighth annual tourney of the American Bowling Congress, held at Kansas City, Mo. Wolf tallied 657 in the five-man event, 650 in the doubles, and 630 in the singles. Henry Summers, twenty-three years old, won the singles with 705. The doubles title went to William and Joseph Hradek of Cicero, Ill., with 1363. The Oh Henry team of Chicago carried off the five-man laurels with 3057.

BOXING. Professional boxing suffered a severe slump in 1928, the climax being afforded by the Gene Tunney-Tom Heeney heavyweight battle for the world championship at the Yankee Stadium on July 26. Despite the widespread publicity this contest received it attracted only 43,191 persons and produced but \$691,014 in gross receipts. Tunney successfully defended his title by knocking out his opponent in the eleventh round of a scheduled fifteen-round bout. It was estimated that Tex Rickard, the promoter of the affair, sustained a loss of \$250,000, the famous boxing impresario's first real financial setback. Soon afterward, Tunney announced his permanent retirement from the ring. This was followed by his marriage to Miss Polly Lauder. Jack Dempsey, former champion, who was defeated in 1926 and 1927 by Tunney, also declared himself through with boxing for all time, but many followers of this sport were of the opinion that Dempsey would fight one more battle with the winner of the proposed elimination heavyweight tournament as his opponent.

Tommy Loughran, holder of the light heavyweight title, proved himself a real fighting champion by defending his crown three times during 1928. He earned a decision over Leo Lomski at Madison Square Garden, New York, and twice defeated Pete Latzo. Mickey Walker succeeded in retaining his middleweight title as the result of a somewhat weird decision over "Ace" Hudkins in Chicago. Joe Dundee, welterweight champion, won from Hilario Martinez in Spain, and Sammy Mandell, lightweight king, conquered Jimmy McLarin. Tony Canzoneri won and then lost the world featherweight laurels. He defeated Benny Bass, but later bowed to André Routis of France. Two world championships were in dispute. Kid Francis and Bushy Graham both claimed the bantamweight title, while Frankie Genaro and Corporal Izzy Schwarz disputed the flyweight honors.

The Amateur Athletic Union championships were contested at Boston, the following being returned winners in the various classes: flyweight, Hymen Miller, Los Angeles, Calif.; bantamweight, Johnny Daley, Waltham, Mass.; featherweight, Harry Devine, Worcester, Mass.; lightweight, Steve Holaiiko, Buffalo, N. Y.; welterweight, Tommy Lown, New York City; middleweight, Harry H. Henderson, Annapolis, Md.; welterweight, Leon Lucas, Philadelphia; heavyweight, George Hoffman, New York City.

Boxing as a college sport advanced a stride further in popularity in 1928, the U. S. Naval Academy winning the Eastern Intercollegiate championship. The individual title winners were: 115 pounds, J. C. Renard, U. S. Naval Academy; 125 pounds, A. Filegar, Penn. State; 135 pounds, H. Williams, U. S. Naval Academy; 145 pounds,

M. Gerin, U. S. Naval Academy; 160 pounds, A. Wolff, Penn. State; 175 pounds, L. O'Malley, Massachusetts Institute of Technology; unlimited class, Leonard Grant, New York University. See OLYMPIC GAMES.

BOY-ED, Ida. German novelist, died May 13. She was born at Bergedorf, near Hamburg, Apr. 17, 1852, the daughter of C. M., and Pauline Ed, and she married Carl J. Boy, Oct. 21, 1870. Living in Lübeck, she wrote polished novels which gave lively, superficial pictures of current society. Among the most popular of her books are *Männer der Zeit* (1885, 3d ed.); *Aus Tan-talus' Geschlecht* (1891, 2d ed.); *Um Helena* (1901); *Ein königlicher Kaufmann* (1910); *Ein Augenblick im Paradies* (1912); and *Vor der Ehe* (1914). She also wrote biographies of *Charlotte von Kalb* (1912); and *Frau von Stael* (1922); as well as a psychological study, *Das Martyrium der Charlotte von Stein* (1916). Her son, Captain Karl Boy-Ed was German naval attaché in the United States in 1915.

BOY SCOUTS OF AMERICA. An organization incorporated in 1910 and chartered by Congress in June, 1916, to develop the character of boys and train them for the duties of adult life by influence brought to bear in their work and play. The National Constitution of the Boy Scouts of America declares the intention to "promote the ability of boys to do things for themselves and others, to train them in scout craft and to teach them patriotism, courage, self-reliance, and kindred virtues." Each boy joining the organization takes the Scout Oath, and the Scout Law requires the members to exert such qualities as trustworthiness, helpfulness, loyalty, kindness, cheerfulness, bravery, cleanliness, and reverence. Among the foremost scout activities are camping and hiking, nature study and many kinds of outdoor work, exercise, and craftsmanship. Successive ranks in membership are attained by passing tests graded in difficulty. Merit badges, 88 in number, may be attained by meeting requirements for each. These cover proficiency in pursuits both of the useful and of the hobby type, such as dairying, plumbing, pioneering, physical development, astronomy, music, chemistry, and others equally diverse. By attaining certain numbers of the merit badges, a boy may rise to the higher ranks of Star, Life, and Eagle scout.

In 1928, 300,000 boys spent a week or more in camp under Boy Scout auspices. Local councils conducted 652 camps; and at least 2400 troop camps were also conducted. The Boy Scout movement, in cooperation with the Forestry Department, fights and prevents forest fires, conserves wild life, and plants trees. It renders services in local campaigns of various sorts and cooperates with many national societies and movements. Membership in 1928 was 794,000, and there were 207,000 Scout leaders. The National Council, the governing body, has its offices in the Park Avenue Building, 2 Park Avenue, 32nd and 33rd Streets, New York. In 1928 the officers were: Walter W. Head, Omaha, Nebr., president; George D. Pratt, Treasurer; James E. West, chief scout executive; Daniel Carter Beard, national scout commissioner; Mortimer L. Schiff, international commissioner. There were 12 regional scout districts, under direct supervision of the National Council's national scout executives, subdivided in 1928 into 661 local councils. The boys were organized into troops of 32 each. The troops were made up of patrols of 8 or less, each under a

boy leader. In small areas, a farm or home Scout Patrol may be formed with as few as 4 boys; and a boy who lives in an area so isolated that he cannot join a troop or patrol, may become a Lone Scout and carry on the Scout programme alone.

Sea scouting is a part of the Boy Scout programme and provides training for older boys in seamanship and water activities. A scoutmaster commissioned by the National Council is provided for each troop. He must be an adult citizen of proved fitness. Troops are commonly formed in connection with schools, churches, or other existing bodies, and each must be sponsored by a troop committee of three or more adults, who select the scoutmaster and supervise the execution of the programme. The movement is non-sectarian, and without military or political connection. The official magazine for boys is *Boys' Life*. The organization also publishes magazines for scout leaders, merit-badge pamphlets, and other material pertaining to the movement.

BRAZIL. The largest of the South American republics; situated in the northern and eastern part of the continent of South America; a federal republic. Capital and largest city, Rio de Janeiro.

AREA AND POPULATION. The area of Brazil is given at 3,285,318 square miles, which gives it an area more than 250,000 square miles greater than that of the continental United States. The country is divided into 20 states, one territory and one Federal District. According to the census of 1920 the population of the Republic was 30,635,605, which represents a density of 9.3 inhabitants to the square mile. The principal cities with their populations, according to the same census are Rio de Janeiro, 1,157,873; São Paulo, 579,033; Bahia, 283,422; Recife, 238,843; Belem, 236,402; Porto Alegre, 179,263. According to statistics furnished by the Statistical Bureau, the population of Brazil on Dec. 31, 1926, totaled 36,870,972, divided among the states, territory, and Federal District as follows:

Afagões, 1,117,045; Amazonas, 409,699; Bahia, 3,859,241; Ceará, 1,520,335; Federal District, 1,360,586; Espírito Santo, 587,451; Goyaz, 640,491; Maranhão, 1,047,206; Matto-Grosso, 312,661; Minas Geraes, 6,902,511; Pará, 1,269,344; Parahyba do Norte, 1,193,260; Paraná, 870,255; Pernambuco, 2,617,310; Piahy, 738,740; Rio de Janeiro, 1,844,304; Rio Grande de Norte, 666,903; Rio Grande do Sul, 2,683,683; Santa Catharina, 847,656; São Paulo, 5,751,822; Sergipe, 524,095; Acre Territory, 106,374. According to figures published in *Wileman's Brazilian Review* in February, 1928, the population of Brazil at the close of 1926 was 36,870,972. An official American estimate placed it at 39,695,000 in 1928.

EDUCATION. Education is free but not compulsory, except in seven states where it is both free and compulsory. In connection with the centenary of the establishment of primary schools in Brazil, celebrated late in 1926, the Bureau of Statistics compiled as complete figures as possible regarding present-day primary education. When published early in 1928, the report stated that although data received from some states were incomplete, it was estimated that, counting public and private kindergartens, one-teacher and graded primary schools, there were about 24,000 schools, 1,500,000 pupils enrolled, and over 35,000 teachers throughout the Re-

public. The latest figures for secondary schools are those for the census year 1920, when there were approximately 450 secondary schools with 48,000 pupils, and 367 professional schools with more than 37,000 pupils. There were also 76 colleges for training teachers. There is only one official university in Brazil, that of Rio de Janeiro.

Promoted by the Associaçao Brasileira de Educacao, the second national conference on education was held in the city of Bello Horizonte, State of Minas Geraes, in September, 1928.

PRODUCTION, ETC. Brazil is primarily an agricultural country with coffee the dominant factor upon which the whole economic well-being of the nation depends. Every year coffee accounts for between 60 and 75 per cent of Brazil's total exports, the remaining 25 to 40 per cent being divided among a number of minor products. Of these rubber is notable because although it is indigenous to the Amazon Valley, competition from Eastern plantation rubber which is produced more efficiently and economically in the East Indies has deprived Brazil of first place in world production since 1912, and only recently have serious attempts been made to systematize and increase production. Cacao is also of superior importance because Brazil produces about 13 per cent of the world supply of this product, being surpassed only by British West Africa. Brazil has great potentialities as a producer of vegetable oil, but this industry is not yet well developed. Brazil nuts constitute more than half of the values of exports of oilseeds and kernels, the remainder being made up largely of palm nuts, cottonseed, and castor seed.

Owing to the vast extent of its agricultural area, the average holding is of large size. Only a small portion is cultivated, but statistics indicate a rapid increase in recent years. Public lands in Brazil are the property of the several states of the Republic, except in such cases where titles have been transferred to the Federal Government for special purposes.

Production figures for 1927 in the terms of the value of exports showed 15,115,000 bags of coffee valued at \$304,954,000 were shipped. The value of those sent to the United States was \$155,951,000. Rubber exports were valued at \$12,735,000; cacao, \$22,490,000; yerba mate, \$13,014,000; cattle hides, \$15,505,000; and tobacco, \$8,476,000. The cotton production was 449,000 bales of 478 pounds each and the sugar production 851,000 long tons. The 1927-28 crops of Brazilian coffee amounted to more than 24,000,000 bags.

Coal, gold, diamonds, petroleum, monazite, manganese, platinum, copper ore, and talc are the chief mineral resources, but none of these products figures conspicuously in the export trade. Sufficient coal is mined to supply about one-half the domestic needs. The forests are extensive and an important source of wealth. Cotton weaving is the most important manufacturing industry in Brazil. According to the latest statistics (1926) there were 329 cotton factories with 2,528,611 spindles and 124,619 workmen, having a capital invested in them of 587,598,000 milreis, and an output valued at 981,082,000 milreis. The manufacture of silk is being encouraged, the Federal Government granting premiums to silk cocoon producers. There were 13 silk mills, 35 woolen mills, and 16 jute mills in Brazil. Of branches of manufactur-

ing are paper mills, tobacco factories, sugar and flour mills, and meat-packing establishments.

COMMERCE. Two major influences on Brazil's foreign trade are the coffee situation and exchange. Constant fluctuations since the beginning of the World War have caused much uncertainty in Brazilian business. With the signing of the stabilization bill on Dec. 18, 1926, however, some of this difficulty was eliminated, and since then there has been a remarkably stable currency upon which business is beginning to rely. Aside from the exchange, the coffee movement is the most important single factor in Brazilian trade activities inasmuch as it approximates three-quarters of Brazil's entire ex-

ported wire, hardware, paints and varnishes, coal, electrical goods, hides, skins, and leather.

According to the Pan American *Bulletin* for September, 1928, official statistics of Brazil's foreign trade for 1927 give the value of imports for that year at 3,273,163,000 paper milreis compared with 2,705,553,000 milreis during 1926. Exports totaled in 1927, 3,644,118,000 milreis, against 3,190,559,000 milreis in 1926. Expressed in terms of United States currency the imports in 1927 were valued at \$387,035,946, the exports at \$430,899,609; in 1926 the imports were valued at \$386,452,404, and the exports at \$455,729,084. The leading exports in 1927, with comparative figures for 1926 were:

^a Number.

during recent years, the São Paulo Coffee Defense Institute has resorted to a policy of restricting shipments of stocks from the interior to Santos, the world's principal coffee export port, thus curtailing sales and maintaining price levels even in the face of record-breaking crops such as that of 1927-28 which, as stated above, amounted to more than 24,000,000 bags.

The United States is by far the best customer Brazil has, and it likewise furnishes a larger percentage of Brazil's imports than does any other country. In 1927 the United States took 45 per cent of Brazil's exports, and sold to Brazil nearly 23 per cent of its total imports. Of Brazil's exports to the United States over 62 per cent consisted of coffee shipments. In Brazil's import trade the United States figures conspicuously as a supplier of automobiles, petroleum products, motion pictures, wheat flour, agricultural and industrial implements and machinery,

FINANCE. On May 3, 1928, at the opening of the Federal Congress, the President of Brazil delivered his annual message, of which a considerable portion was devoted to an exposition of the financial status of the Republic during 1927. In view of the large investments of American citizens in Brazil, the Executive's statements are of especial interest. For the first time in many years the financial operations of the Government, according to the President, resulted in a surplus. Revenues totaled 1,994,179 contos (about \$239,301,480) and expenditures 1,968,599 contos (about \$236,231,880). Although the surplus is comparatively insignificant, the fact that there is one is worthy of comment. During the 39 years of the Republic's régime, from 1889 to 1927, inclusive, upon only ten occasions have revenues exceeded expenditures. From the outbreak of the World War in 1914 through 1926, the total deficits are estimated at over 3,500,000

contos (about \$420,000,000). Examination of the figures disclose that both revenues and expenditures exceeded the budget estimates of 1,797,979 and 1,794,198 contos, respectively. Unfortunately, however, the data given by the Executive for the composition of the actual receipts and disbursements were so incomplete that analysis of the results is quite impossible. Only the following totals were presented:

BRAZILIAN REVENUES AND EXPENDITURES IN 1927

Item	Revenues	Expenditures	Surplus	Deficit
	Contos ^a	Contos ^a	Contos ^a	Contos ^a
Ordinary	1,880,646	1,320,866	559,780
Extraordinary	332,089	332,089
Special	113,533	315,644	202,111
Total	1,994,179	1,968,599	25,580

^a Conto = \$120.

The Brazilian budget for 1928, passed by Congress before its adjournment at the end of December, 1927, showed a deficit of 151,990 paper contos. The President did not sanction this budget but held it for the exercise of his power of partial veto until Jan. 15, 1928, on which date the final budget, as reduced by the President, was published. After the exercise of the partial veto power by the President, the budget showed a surplus of 117 paper contos. Total budgetary revenues and expenditures for 1928 were calculated at 2,088,933 and 2,088,816 paper contos, respectively, gold items having been converted into paper at a rate of 4.5765 paper mil-

nal debt into a consolidated foreign loan. The consolidated internal debt on Dec. 31, 1927, amounted to 2,435,367,300 milreis, or 43,306,000 milreis more than the preceding year. This increase was due, first, to the issue of certificates to bearer amounting to 8,456,000 milreis; secondly, to obligations incurred during the two previous years; and lastly, to 43,134,000 milreis of railway obligations—a special fund for a special purpose of which 8,234,000 milreis were redeemed in 1927. A presidential decree of May 3, 1928, fixed the value of the gold milreis at 4.567 paper milreis for the collection of payment in gold in the governmental administrative branches. Owing to the fact that a certain portion of the customs duties, taxes, and other public receipts is collected in gold, there had hitherto been considerable difficulty in calculations, due to the variations of the gold milreis expressed in paper.

COMMUNICATIONS. *Wileman's Brazilian Review* for Feb. 23, 1928, gave the following facts on railway development for Brazil. Construction of the first Brazilian railway was begun in 1852, nine miles being open to traffic in 1854. At the end of 1860 only 138 miles were open to traffic, and in 1870, only 462. During the next ten years, however, the mileage increased considerably, reaching 2112 miles, and rising steadily, to 6198 miles in 1890, to 9519 miles in 1900, to 13,342 miles in 1910, to 17,747 miles in 1920, and to 19,466 miles in 1926. Increases in mileage during 20 years were distributed as follows:

States	1907	Miles 1926	Increase Miles	Per cent
Amazonas, Goyaz, Matto Grosso	915	915
Pará, Maranhão, Piauí, Ceará	587	1,383	796	135.4
Rio Grande do Norte, Paraíba, Pernambuco, Alagoas, Sergipe, Bahia	2,053	2,668	615	29.9
Espirito Santo, Rio de Janeiro, Minas Geraes, São Paulo	7,069	11,192	4,123	58.2
Santa Catharina, Paraná, Rio Grande do Sul	1,404	3,308	1,904	135.4
Total	11,113	19,466	8,353	75.1

reis to 1 gold milreis. Budgeted expenditures for 1928 showed an increase of 309,694 paper contos over those of 1927. The greatest reductions made by the President were in the Ministry of Transportation. The largest single item vetoed was that of 25,000 paper contos for the extension of present railways and the construction of new lines. The total expenditures itemized according to departments, as given in the final budget, are as follows: Justice and Interior, 145,040 paper contos; Foreign Relations, 31,172; Navy, 144,753; War, 255,548; Agriculture and Commerce, 80,696; Transportation, 533,485; Treasury, 898,122. Service on the foreign debt for 1928 totaled 473,210 paper contos. Expenditures of the Treasury Department showed an increase of 226,130 paper contos. The increase in this department's gold appropriation, amounting to 137,300 paper contos, is largely to meet the increased interest and amortization charges on the foreign debt. Service on the internal funded debt was placed at 163,606 paper contos.

According to President Luis's address to Congress, the foreign debt on Dec. 31, 1927, amounted to £109,284,477, 335,553,830 francs, and \$156,890,267, showing an increase of £6,853,657 and \$36,506,433, and a decrease of 935,067 francs in the year. The increase in the foreign debt was due to the conversion of the floating inter-

The States which possess the greatest mileage are Minas Geraes, with 4758 miles; São Paulo, with 4227 miles; Rio de Janeiro and the Federal District, with 1763 miles; Rio Grand do Sul, with 1882 miles; and Bahia, with 1218 miles, which aggregate 13,848 miles or 71 per cent of the total Brazilian mileage. Brazil has railway communication with Argentina and Uruguay, and plans to extend her system to Bolivia. The length of the lines in operation and projected at the close of 1926 were as follows:

Railways	In miles Government concession	States' concession	Total
In traffic (single track)	14,589	4,877	19,466
Under construction	972	303	1,275
Projected	4,025	292	4,317
Total	19,586	5,472	25,058

The principal railway is the government-owned Central of Brazil which has a total length of line in operation of 1804 miles. This railway connects the city of Rio de Janeiro with the States of Minas Geraes, São Paulo, and Rio de Janeiro and has extended its service to Bahia. An American estimate of railway mileage in 1928 placed it at 19,576 miles. In 1926 there were 33,060 miles of highway, 103,020 miles of

telegraph wire, and 36,836,114 tons of shipping entered and cleared at the ports of the country. In 1928, 102,984 telephone instruments were in use and 136,000 automobiles registered.

GOVERNMENT. The executive power is vested in the President, who with the Vice President is elected directly by the people for four years and is ineligible for reelection; and the legislative power in the National Congress which consists of the chamber of deputies and the senate, the former having 212 members elected for three years by popular vote on the basis of minority representation, and the latter 63 members elected for nine years by direct vote, one-third being retired every three years. The Vice President presides over the Senate. President in 1928, Dr. Washington Luis Pereira de Souza (assumed office Nov. 15, 1926); Vice President, Mello Vianna.

HISTORY. In a year of comparative quiet, the rumblings of the revolutionary movements in the State of São Paulo were only slightly heard. The Government continued its strong policy of repression and made every effort to prevent the rebels from crossing the border into neighboring countries. From an economic point of view the agreement between the State of Para and the Ford Motor Company of the United States for the growing of rubber was of more than passing moment. The movement was not received in some quarters of Brazil on the grounds that it might hurt native industry. Of local interest was the settlement of the Apararotis-Tabatinga boundary dispute between Brazil and Colombia, which was brought about by direct negotiations between the two countries involved. On Dec. 25, 1928, Brazil and Bolivia signed a treaty fixing definitely a common frontier not included in the treaties of 1867 and 1903 and including plans for a railroad to connect Cohabamba and Santa Cruz de las Sierras with ports on the Amazon and Paraguay rivers.

BRENNAN, GEORGE E. An American politician and democratic leader in Illinois, died August 8, at Chicago. He was born at Port Byron, N. Y., in 1865. By his twelfth year he was working in a coal mine at Braidwood, Ill. An accident which resulted in the amputation of his leg, forced him to give up physical work and fit himself for teaching. After a few years spent in teaching he accepted the position of a clerk in the office of the Secretary of State, W. H. Hinrichsen, at Springfield, from 1893 until 1897. Mr. Brennan moved to Chicago afterward and engaged in the casualty insurance and surety bond business. By 1906 he had become the manager of the Chicago office of the United States Fidelity Company. To him as an active worker for the Democratic party, politics continued to appeal, and in 1920 he was sufficiently powerful to oppose effectively the nomination of William G. McAdoo at the National Convention. For the next four years he devoted himself to the Chicago government, in opposition to William Hale Thompson, the Republican Mayor. In 1924 he was a dominant figure in the Democratic National Convention, serving as chairman of the Illinois delegation and becoming in that year a member of the Democratic National Committee. He again opposed Mr. McAdoo, and supported Alfred E. Smith. He was a vehement anti-prohibitionist, and ran, unsuccessfully, against Frank L. Smith for the office of United States Senator.

BRETHREN, CHURCH OF THE. A church established in the United States in 1719 at Germantown, Pa. It originated in Schwarzenau, Germany, in 1708, and is the largest of the five branches of the denomination formerly known as the German Baptist Brethren or "Dunkers." Other churches of this group are: The Church of God (New Dunkards); Brethren Church (Progressive Dunkers); German Seventh-Day Baptists; and Old Order German Baptists Brethren. The policy of the Church of the Brethren corresponds more nearly to the Presbyterian than to any other specific ecclesiastical form. It comprises 49 district conferences and holds a General Conference annually. Figures for 1923 showed 1031 churches and a membership of 133,751; Sunday schools numbered 1180 and scholars, 135,000. Foreign missionary work was carried on in India, China, and Africa. The total membership in India and China was 4829 in June, 1928. Expenditures for the year ending Feb. 29, 1928, totaled \$315,836. Eight colleges, one academy, and one theological seminary and training school maintained by the denomination had an enrollment of 4843 students. Officers of the General Conference in 1928 were: The Rev. Otho Winger, North Manchester, Ind., moderator; the Rev. V. F. Schwalm, McPherson, Kans., reading clerk; and I. B. Book, North Manchester, Ind., writing clerk. The Rev. Otho Winger, North Manchester, Ind., was president of the General Mission Board. The *Gospel Messenger* is the official organ of the denomination. The *Missionary Visitor* is the promotional periodical of the General Mission Board. The headquarters of the General Mission Board, Board of Religious Education, and the Council of Boards are at Elgin, Ill.; of the General Education Board, 3635 Ordway St., N. W., Washington, D. C.; and of the General Ministerial Board, Pleasant Hill, Ohio.

BREWER, SIR ALFRED HERBERT. A distinguished British organist and conductor, died at Gloucester, March 1. He was born there, June 21, 1865. Even before completing his studies at the Royal College of Music he served as organist at St. Catharine's in Gloucester and immediately after his graduation, in 1885, he was appointed organist at Bristol Cathedral. From 1896 until his death he was organist and choir-master at Gloucester Cathedral, conductor of the Gloucester Triennial Music Festival and the Gloucestershire Orchestral Society. He composed several cantatas and services, minor orchestral works, pieces for organ and for piano, anthems and songs.

BRIAND PROPOSALS. See KELLOGG TREATIES.

BRIDGES. The remarkable growth of motor transportation, which had brought highway construction from a relatively neglected art into the forefront of engineering activities within the past twenty years, continued to be the most important influence in bridge progress during 1928. The needs of transportation to and from great urban centres has justified bridge and tunnel constructions which break all records. Suspension bridges have continued in favor for long spans and highway loads, loads which, although heavy compared with former road practice, are light compared with railroad requirements. Such suspension bridges as the Mid-Hudson (1500-feet) and Mount Hope (1200-feet) or even the Detroit International (1850-feet) are, of course, overshadowed by the huge Hudson River work of 3500-foot span, about twice as large as the greatest hitherto erected, under construction during the year.

When the Hell Gate Arch, a 1000-foot span across the East River, N. Y., was completed in 1917, it was hailed as the greatest arch in the world. A rapid-transit-highway arch, a 1650-foot span, was under erection at Sydney, Australia, and plans were settled for a 1675-foot highway arch to cross Kill Van Kull at Bayonne, N. J. The year also saw the completion of an arch bridge at Newcastle-upon-Tyne in Great Britain, and another daring arch in the wilds of Arizona, 130 miles from the nearest railroad. These are simply outstanding examples of the extent to which highway requirements had given new life and impetus to long-span bridge construction.

Cantilever bridges are also used where location and costs favor such construction. Perhaps the Snake River cantilever in Idaho, 502 feet above stream bed, held the height record, and two important cantilevers with long approaches, which would have attracted great attention a few years previously, were quietly opened in the Autumn of 1928 by the New York Port Authority to join Staten Island and New Jersey.

The outstanding development in structural steel of the last year or two undoubtedly was the widespread use of oxy-acetylene cutting and welding methods. By 1928 practically every steel erection party had an oxy-acetylene torch on the job and the same process was extensively used in shops where steel work is fabricated. That this rapid and inexpensive method of cutting steel had great advantages is obvious, but at the same time it is known to impair the quality of the metal adjacent to the cut and may set up internal temperature stresses causing serious overstrain. More thorough control of its use than now exists is obviously essential.

Welding had reached the point where there were both a building and a bridge in which welds had replaced the older riveting methods. Here again it was considered possible to go too far with a method which possesses undoubted advantages but which also has its limitations and may frequently seriously impair the shock resisting quality of the metal adjacent to the weld. A new and rapidly growing process was in the formative stage, and the future will doubtless see not only the development of welding details, better suited to the process than the forms taken from riveting practice which had so far predominated but also a clearer understanding of its limitations and the conditions under which its use may be conservatively recommended.

The further use of specially heat-treated and carbon and alloy steels continued in new works planned or undertaken during the year. Nickel steel, a few years ago prohibitive in price compared on a strength basis with structural steel, had at last found itself. These trends were well illustrated by the fact that in the plans for the Great Kill van Kull Arch, announced at the end of the year, over one-half the tonnage was alloy-steel.

The financing problem continued in an interesting stage. In several States definite steps were taken to prevent the construction of great highway works as private toll bridges. A number of great works under way or completed in 1927 were of this type, but it would appear that the scheme of State or commission control and construction on a plan by which the bridge becomes free as soon as tolls have paid for construction, will probably be extended. The work of the New York Port Authority was on this basis and ap-

pealed to many as an ideal solution of the finance problem provided such bodies can be kept free of political influence.

HUDSON RIVER BRIDGE. Very satisfactory progress was made on this great work, which involves a clear span of 3500 feet or almost exactly twice that of the largest span bridge ever built. The two great steel towers (625 feet or almost the height of a 60-story building) were carried up to within two column lengths of their full height. The excavation of the deep approach cut through the Palisades at the west end (Fort Lee, N. J.) was well advanced and masonry wall construction under way. At the east (New York) end, the massive interior concrete masonry of the anchorage was almost completed. The two huge masses supporting the saddles over which the cables bend in passing into the anchorage were practically complete. The girders and eye bar connections, to which the cables were to be fastened, were completely placed and rapid progress was being made in covering these anchors with a mass of concrete which will be some 85 feet high and will give the requisite weight to resist the immense pull from the cables.

Discussion still continued regarding the architectural treatment of the structure, particularly the proposal of the architectural adviser, Cass Gilbert, to cover the steel towers with a granite facing. Another feature of the bridge is even more important. The design is unusual in that the towers of all previous suspension bridges have been so placed that the cables are inclined at the same slope each way from the tower. In the Hudson Bridge, foundation conditions and the requirements of navigation were such that the towers had to be placed near shore. This gave a great centre span, but short approach spans—the cables bending down sharply from the towers to the anchorages. In this design, therefore, the cables have to be securely fastened at the tops of the towers and the short, steeply inclined ends are in effect simply back-stays to prevent the great centre portion of the cables pulling the towers over. While it would appear to be good bridge aesthetics clearly to indicate this fundamental structural feature of the design in the architectural treatment of the bridge, quite the contrary has been shown in the architect's drawings. The cables apparently pass freely through openings in the top of the towers.

DETROIT-WINDSOR BRIDGE. After many delays due to difficulties in financing and lack of support both on the part of the public and railroad interests, the International Bridge across the Detroit River from Detroit to Windsor, was put under way. Contracts were let in 1928 for the cables and suspenders. The bridge will be, with approaches, about 1.7 miles long and the main span, 1850 feet, will be 100 feet greater than the Philadelphia-Camden Bridge, the longest suspension bridge in the world. It was expected that the bridge would be completed in 1930. It was finally being built as a private highway toll bridge and was to have a river clearance of 152 feet. Approach spans were to be carried on steel viaducts and therefore there will be no suspenders in the end spans of the cables. Two cables each consisting of 37 strands of 206 No. 6 galvanized specially heat-treated wires were to be used. This was the same type wire used in the Mount Hope Bridge and was furnished by the same company. (*Eng. News-Record*, September 27-28.)

MOUNT HOPE SUSPENSION BRIDGE. Another privately owned toll bridge was under construction between the mainland of Rhode Island and the island on which is located the important summer colony of Newport. A main suspended span of 1200 feet is used with side spans of 504 feet and steel viaduct approaches of cantilever design. Two 11-inch cables, each consisting of 7 strands of 350 No. 3 specially heat-treated wires were to be used. Heat treatment was being used for the first time to increase the yield point of the wire although its ultimate strength will be little affected. The anchorages of this bridge are also unusual in that they form practically no part of the architectural design but consist simply of low concrete chambers filled with sand. They are less than half the height of the approaches and one of them is located in water. (*Eng. News-Record*, April 12-28, p. 585.)

MID-HUDSON BRIDGE. An unexpected difficulty was encountered in the pier construction for the 1500-foot suspension span of this State highway bridge at Poughkeepsie, N. Y., when in July, 1927, the east caisson suddenly listed and finally tipped over to a position of $43\frac{1}{2}^{\circ}$ from the vertical. The two river piers were being built by the open-dredging process using reinforced concrete caissons, 60 by 136 feet, with 25 dredging wells. They were to be sunk over 100 feet below water. No progress was made in righting this caisson in 1927, but work during 1928 finally resulted in July, 1928, in moving this huge and heavy mass of concrete (19,000 tons) back in position. No difficulty was experienced with the west pier and the work was to go rapidly forward to completion.

STEBENVILLE SUSPENSION. This 689-foot main span suspension bridge over the Ohio River at Steubenville is of particular interest for the novel methods used in its design and construction, rather than for its size. The steel towers were built of rolled steel I-beam sections instead of the usual members fabricated by riveting from rolled shapes. Four 30-inch, two 15-inch, and one 24-inch beams were used in each tower leg. Furthermore, the strands of the two cables, each 1300 feet long and composed of 7 strands of 280 No. 8 wires, were spun on land and each strand was moved into place on a special messenger cable. Final wrapping of the strands, after squeezing them down to $8\frac{1}{2}$ -inch diameter, was not done until after the completion of the concrete bridge floor. A similar plan of land spinning, instead of the usual scheme of spinning the cables in place, was used on the 700-foot Portsmouth Suspension Bridge over the Ohio in 1927 (*Eng. News-Record*, Oct. 20, 1927) and represented a new development which resulted in cost reduction and can be successfully applied to smaller suspension structures. (*Eng. News-Record*, Aug. 30, 1928, p. 304.)

THE GREAT ARCH AT SYDNEY, AUSTRALIA. Satisfactory progress was made on the construction of this great arch which exceeded by a large margin the longest arch span in the world. This bridge (span, 1650 feet) was to carry both railroad and highway, being designed with a 56-foot roadway and for two tracks of rapid-transit and two of electric street cars. A peculiar arrangement of concrete in the lower, main body of the abutments, which take the arch thrust, is particularly interesting. The concrete was poured in separate stringers or blocks running perpendicular to the bridge axis, each block being of honeycomb cross-

section. Adjoining blocks were not poured until seven days had elapsed, so as to allow for shrinkage in setting.

THE KILL VAN KULL ARCH. Plans were published in December, 1928, for this greatest of steel arches to connect the long peninsula running south from Jersey City to Bayonne with the northern part of Staten Island in New York Harbor. A single span across the Kill van Kull of 1675 feet centre to centre of bearings will make this work, to be completed in 1931 or 1932, the greatest arch in the world. While the famous Hell Gate railroad arch of 1917 was designed for one of the heaviest loads any bridge has ever been called upon to carry (four tracks of Coopers E-60 loading), this new arch will carry only a 40-foot highway roadway and later two rapid-transit lines. For this reason the reactions of the two bridges will be about the same, and the principal members of the Kill Van Kull arch will actually be lighter than those of the Hell Gate work.

While a high-carbon steel was used at Hell Gate and was a new departure, both silicon and nickel steels will be employed to an amount exceeding 50 per cent of the total steel to be used in the new arch. The work will cost \$16,000,000. The construction of the abutments was under way and contract for superstructure had been let to the American Bridge Co. Excellent rock foundations are available within a few feet of bottom in shallow water. The War Department, however, was requiring a free passage 510 feet wide, which is not symmetrical with respect to the span, and which will complicate erection. (*Eng. News-Record*, Dec. 13, 1928, p. 873.)

THE NEWCASTLE-GATESHEAD ARCH. King George V opened the new arch span, high level highway bridge (see 1927 YEAR BOOK) over the River Tyne at Newcastle on Oct. 10, 1928. This steel-arch bridge with a span of 531 feet and a rise of 170 feet from pin centres, is the longest arch in Great Britain. With high steep banks on either side, the Tyne crossing has long been an important one, being on the Great North Road. The High Level Bridge of Robert Stephenson's, opened in 1844 by Queen Victoria, solved the problem for many years and was a notable achievement in arch-bridge construction. Its lower level was used as a highway toll bridge (the upper level is railroad), but had failed, however, to meet present traffic demands. The new bridge is municipally owned and free. One of its most interesting features is found in the use of the interior of the large abutment towers (60 by 100 feet and 90 feet high to the bridge floor) as warehouses. (*Engineering*, Oct. 19, 1928, p. 488.)

THE GRAND CANYON ARCH. The famous but difficult and dangerous Lee's Ferry, established in 1871 as a means of crossing the Colorado River just north of the Grand Canyon National Park, was replaced in 1923 by a 616-foot steel highway arch. Although the span was large, the chief interest in the design was in the influence upon it of the fact that the bridge was 130 miles from the nearest railroad station at Flagstaff, Arizona. Erection plant had to be reduced to a minimum because the entire cost had to be charged to the job as the cost of the long return haul would exceed the salvage value of the plant. A three-hinged deck arch proved to be most economical. This had to be erected from each side of the canyon rim as a cantilever, for the floor was 467 feet above water level. Parts which went into the final

structure were utilized as back-stays to support the arch during erection and the most strict economy in weight was followed in design. Half the arch was erected, a cableway was slung across to the far side of the canyon from the end of this half-arch, steel for the other half was thus transferred to the far side and the second half-arch was cantilevered out to meet in the centre. The rapid drop in temperature after sundown made quick work necessary in lowering the two half-arches to close the span. This was done by screw-jack toggles on September 12. Two auto trucks ($3\frac{1}{2}$ and 10 tons) delivered the 1200 tons of steel and other supplies, chiefly cement. The total cost was about \$300,000. The fireproof, concrete roadway 18 feet wide was designed for a 15-ton truck and the main arch for a uniform live load of 60 lbs. per square foot. (*Eng. News-Record*, Nov. 1, 1928, p. 646.)

RECONSTRUCTION OF HIGH BRIDGE. The work of replacing five of the masonry arches of this famous aqueduct bridge over the Harlem River in N. Y. (described in 1927 YEAR BOOK) by a single steel arch of about 425-foot span, was completed and the bridge reopened on Oct. 27, 1928.

An interesting view of the changes in bridge erection methods in the last fifty years is afforded by a comparison of the method used in erecting the ribs of the similar but longer arches of Washington Bridge, just north of High Bridge, and those of the new High Bridge arch. A perfect forest of timber work, built on temporary piles driven in the river bed, was used to support the former arches during erection. At High Bridge a simple steel trestle work, interfering in no way with river traffic, served not only for the demolition of the old masonry arches but also for the erection of the new span.

ARLINGTON MEMORIAL. The superstructure of this remarkable work, which has been described as an extremely costly monument with some openings in it so that the Potomac River could pass through, was started during the year. (For description of bridge see *The Military Engineer*, March-April, 1928). The construction of the piers and abutments was completed in January and work on the eight concrete arch spans was begun, the spans ranging from 166 to 180 feet. Steel centres were being used, five ribs to each span, and were assembled on barges with proper cross-bracing, etc., floated into place and set as a unit. The two haunch quarters of the arch barrel were first poured, then the centre quarters, keyblocks of $3\frac{1}{2}$ -foot width being left between each main block. The concrete work was to be completely masked by a granite facing, the great cost of the architectural treatment of this structure making it an architectural rather than an engineering work.

SNAKE RIVER CANTILEVER. Built to meet a condition somewhat similar to that at the Grand Canyon, the 700-foot light highway cantilever bridge crossing the canyon of the Snake River about 3 miles north of Twin Falls, Idaho, probably holds the record for height above the valley crossed. Its floor is 476 feet above ordinary water level or 502 feet above stream bed. It replaced steep zigzag roads which led to the valley bottom and a low level toll bridge. The bridge is a privately owned toll bridge under a 50-year franchise. The concentrated loading provided for consists of two 25-ton trucks and the uniform load of 1200 to 1700 pounds per foot on a 27-foot roadway (*Eng. News-Record*, February, 16-28).

The first motor car passed over on September 1.

THE ARTHUR KILL CANTILEVER BRIDGES. Two highway toll bridges erected by the New York Port Authority, to join Staten Island with the New Jersey mainland across Arthur Kill, were dedicated on June 20. Both are through cantilever spans with long deck-plate girder approaches. The southern bridge, with a 750-foot central span and 300-foot anchor arm side spans, crosses between Perth Amboy, N. J., and Tottenville, S. I., and is known as the Outerbridge Crossing. The northern structure, of identical type but somewhat smaller span, has been named the Goethals Bridge in honor of the famous army engineer, and crosses from Elizabeth, N. J., to Howland Hook, S. I.

THE JAMES RIVER BRIDGE. This structure, said to be the longest highway bridge in the world, across the James River at Newport News, Virginia, was opened on Nov. 17, 1928. With the Chuckatuck Creek and Nansemond River bridges and ten miles of concrete highway, it forms an important connecting link for the coastal highway system of the State. It is mostly of concrete trestle construction with I-beam stringers and has a total length of 23,150 feet. The central deep-water channel is crossed by a 300-foot steel-lift span with steel towers, with four through truss approach spans on either side. Its chief interest is in the long concrete pile and steel girder approaches, in the use of a lift span, and in its extreme length. It was built by the Turner Construction Co. for the James River Bridge Corporation and was to be operated as a toll bridge.

WESEL RAILROAD BRIDGE. The need of replacing earlier structures, still in reasonably good condition but incapable of carrying safely modern heavy bridge loads, was recognized in the reconstruction of the railroad bridge over the Rhine near Wesel. The four (334-foot) original wrought-iron, semiparabolic bowstring girders erected in 1872-74 were replaced by Rauten-type trusses (practically through double Warren trusses) continuous over two spans.

CHICOPEE FALLS WELDED RAILROAD BRIDGE. Introduced only a few years ago, arc welding was first used in 1928 in the construction of a single-track railroad bridge by the Westinghouse Electric Co. at Chicopee Falls, Mass. The bridge is on an important industrial spur track of the Boston and Maine Railroad serving the Westinghouse plant located at Chicopee. It is a Warren truss through span in which sub-divided panels were used because of the great skew of the bridge which is 72 degrees. Each truss has a span of $134\frac{1}{2}$ feet and is designed for Coopers E-50 loading. Three types of welds were used—fillet, slot, and butt. The two former were estimated for 3000 and 5000 pounds per linear inch of weld, respectively, and the latter for 13,000 pounds per square inch. The welding equipment consisted of two 200-ampere Westinghouse single-operator sets and the bridge was erected on blocking, at the side of the canal which it spans, and then moved into place. This first more or less experimental work was of great interest and appeared to indicate great possible economies in lighter steel construction should the methods employed become standard. (*Eng. News-Record*, July 26 1928, p. 120; *Ry. Age*, Mar. 24, 1928, p. 664.)

CARLTON RAILROAD-HIGHWAY LIFT BRIDGE. In addition to the lift span in the James River Bridge, already noted, an interesting lift bridge was built at Bath, Maine, to replace the old

car ferry crossing the Kennebec River. It was opened late in 1927 and is a double-deck structure 2076 feet long, with highway above and railroad below. The lift span is 234 feet with towers sufficient to give a clearance of 135 feet. A particularly notable feature of this work was the fact that a new record for depth was established in the pneumatic caisson construction used for the foundations. The famous Ead's Bridge at St. Louis had held this record for over 50 years and the new work, although slightly greater, exceeds Captain Ead's remarkable performance by only a few feet. The pier caissons at Bath were carried down to depths of 110, 114, and 118.7 feet below mean tide to which about 4.3 feet must be added for high tide conditions. An air pressure of 50 pounds per square inch was used and workmen were allowed to work for only 50 minutes at a time. Fifty pounds would appear to be about the limit of human endurance in this type of work but, while Captain Ead's had over a hundred cases of caisson disease and a dozen deaths, it has been found how to protect the workers and 50 pounds can be safely sustained for picked men with careful supervision.

ROYAL TWEED BRIDGE, BERWICK. Another bridge on the Great North Road, between Newcastle upon Tyne, where the arch already mentioned has just been completed, and Edinburgh, is at the famous Tweed Crossing. The famous old masonry arch, built in the seventeenth century, had proved too narrow and its approaches too steep and curving to accommodate modern highway traffic. The new bridge crosses the Tweed in three main arches of reinforced concrete, the spans varying from 248 to 361½ feet, and forming the largest reinforced concrete spans yet built in Great Britain. The varying arch spans were used because the floor line has a grade of 1 in 51 from Tweedmouth to Berwick. It is a long bridge, being 1378 feet with approaches. Each arch consists of four reinforced concrete ribs, which ribs are made of hollow section for the thirds of the span near the springings, while the centre third is solid. Designed for a moving load of 50 long tons on four wheels, this bridge again shows the much heavier highway loads used in British design as compared with American practice. Construction was begun in 1925 but completion was delayed because of unexpectedly difficult foundation conditions and it was not opened until May, 1928. (*Engineering*, May 4, 1928, p. 527.) This work would appear to be by far the most notable concrete bridge of a year which has not been particularly noted for structures of this kind.

HACKENSACK CROSSING ON THE LACKAWANNA RAILROAD. One of the major railroad projects of the year was the construction of long concrete approaches with a lift span over the Hackensack River, N. J., by the Lackawanna Railroad. The War Department had refused to give relief to the railroads crossing this stream by permitting them to keep their draw bridges closed during the morning and evening rush hours when suburban traffic was going to and from New York. In order to avoid these vexatious delays, the Lackawanna built this new three-track crossing at a cost of over \$3,000,000. The new work would accommodate boats requiring up to 40-foot clearance and, as these constitute 75 per cent of the river traffic, the need for frequently opening the draw will be reduced. The approaches were in large part flat-slab construction, such had been used in flat-slab

building design, supported on tall circular columns resting mainly on concrete, cast-in-place piles. The lift span is 198-feet. The entire work was being carried out without disturbing traffic which passes over the old bridge.

HACKENSACK BRIDGE COLLAPSE. On December 15 the east half or leaf of the two-leaf span by which the Lincoln Highway crosses the Hackensack River into Jersey City, N. J., suddenly collapsed. An investigation showed that the initial cause of failure was the breaking of the north tower to which the counterweight of concrete, balancing the lift leaf, was attached. This failure permitted the 770-ton concrete mass to fall upon and wreck half of the bridge. The failure was attributed to inadequate and faulty design of the parallelogram arrangement and towers for supporting the counterweight. The west half was also found to be in a dangerous and overstressed condition. Fortunately no lives were lost in this failure which it is hoped will concentrate attention on this type of design.

See also under **ARCHITECTURE, France**, description of bridge at Pluguestel.

BRIDGMAN, FREDERIC ARTHUR. American genre and historical painter, died at Rouen, France, January 13. He was born at Tuskegee, Ala., Nov. 10, 1847. From 1863 to 1866 he was a steel engraver. In the latter year he went to Paris, where he studied at the Ecole des Beaux-Arts under Gérôme. His earliest paintings were of Breton and Norman subjects. One of them is the well-known "American Circus in Normandy," in which characteristic American types among the performers are placed in interesting contrast with the French peasants who fill the seats. He visited Algiers in 1871, and thenceforth he selected Oriental subjects, making elaborate studies during extensive travels in northern Africa, Egypt, and Nubia. Bridgman's later work, though sometimes deficient in line, is characterized by brilliancy of coloring and facility of execution. He made his home in France, mainly in Paris, but frequently exhibited his paintings in the United States, and in 1891 he was elected a member of the National Academy. In 1900 he was chairman of the department of American art at the Paris Exposition. He won several medals and in 1907 was made an officer of the Legion of Honor of France. He was also a member of the Bavarian Order of St. Michael. Mr. Bridgman was talented in music and wrote several symphonies, besides other works, and he wrote books in French and in English.

BRIGHAM YOUNG UNIVERSITY. A co-educational institution at Provo, Utah, founded in 1875, and maintained under the auspices of the Church of Jesus Christ of Latter Day Saints. It comprises colleges of arts and sciences, education, commerce and business administration, applied science, fine arts, and divisions of research and extension. The 1928 summer session enrollment was 396; the autumn session enrollment, 1250; and the faculty numbered 98 members. The library contained 60,000 volumes and 45,000 pamphlets. The budget for the year was \$338,000, and a new stadium and athletic field were completed in 1928. President, Franklin Stewart Harris, Ph.D.

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE. An association founded in 1831, when it first met at York, composed of 13 sections, representing all branches of pure and applied science. At the annual meet-

ing which was held in Glasgow, September 5-12, more than 3000 were registered. Although nothing of a sensational nature was disclosed at the meeting, the accomplishments were of a most useful and important nature. Formal proceedings began on the evening of September 5, when Sir William Bragg took over the presidential chair occupied during the preceding year by Sir Arthur Keith. In his inaugural address on "Craftsmanship and Science," he called attention to the differences between craftsmanship of the early civilizations and the more complicated craftsmanship of modern times, and emphasized the fact that the craftsmanship of a people is an expression of the best of itself, and that while early craftsmanship centred around the individual, that of the twentieth century depends upon machinery. He called attention to the close relation between scientific knowledge and craftsmanship, to the dependence of the latter upon the former, and paid tribute to the growing number of research workers, research associations, and industrial laboratories, which, however, he considered relatively small in proportion to the need for their services and the extent to which science can be applied to industrial processes. He concluded his address with the thought that the ultimate aim of science is its function in keeping body and soul together, not to destroy the soul of a nation, and called upon the scientist to devote himself wholeheartedly to his work so that he might learn to be of use to his fellow men.

An interesting and varied programme arranged for the meeting included presidential addresses to the several sections by: Prof. Alfred W. Porter, Section A (Mathematics and Physics), on "The Volta Effect: Old and New Evidence," a subject which has long been of interest to physicists; Prof. E. C. C. Baly, Section B (Chemistry), on "Fluorescence, Phosphorescence, and Chemical Reaction"; E. B. Bailey, Section C (Geology), on "The Palaeozoic Mountain Systems of Europe and America," a natural development of the writing of Suess and Bernard; Prof. W. Garstang, Section D (Zoölogy), "The Origin and Evolution of Larval Forms," in which he selected the mollusca as a large and representative class of marine invertebrata; Prof. J. L. Myres, Section E (Geography), "Ancient Geography in Modern Education"; Prof. Allyn Young, Section F (Economic Science and Statistics), "Increasing Returns and Economic Progress"; Sir William Ellis, Section G (Engineering), "The Influence of Engineering on Civilization"; Prof. T. H. Pear, Section J (Psychology), "The Nature of Skill"; Dr. Cyril Norwood, Section L (Educational Science), "Education: The Next Steps"; Dr. J. S. Gordon, Section M (Agriculture), "The Live Stock Industry and Its Development."

On September 11, a semi-popular lecture was delivered by Sir John Stirling-Maxwell on "Forestry in Scotland: Past, Present and Future." Evening discourses to the Association were delivered by Prof. E. A. Westermarck, on "The Study of Popular Sayings," and by Professor Frederick George Donnan, on "The Mystery of Life," in which he pointed out the way in which physiology is slowly examining and reducing to quantitative measurement the various qualities and properties of the living organism.

A feature of the meeting was a special honorary graduation ceremony held on September 10, the list of graduates consisting of Sir William Bragg, Sir Thomas Holland (president elect), Dr.

Adrien Loir, who represented the Association française pour l'Avancement des Sciences; Dr. J. L. Stevens, representative of the American Association for the Advancement of Science; Prof. E. Suess; Prof. R. Zeeman; Prof. Shailer Mathews; and Prof. E. A. Westermarck.

It was announced that the 1929 meeting would convene at Cape Town, South Africa, July 22, at which time the president, Sir Thomas Holland, K.C.S.I., K.C.I.E., F.R.S., was to be installed. Other officers elected at the Glasgow meeting were: General secretaries, Dr. F. E. Smith, C.B., F.R.S. and Prof. J. L. Myres, O.B.E.; general treasurer, Sir Josiah Stamp, G.B.E.; secretary, O. J. R. Howarth, O.B.E. It was also decided to hold the 1930 meeting at Bristol.

BRITISH COLUMBIA. A Canadian province on the Pacific Ocean, lying between Alaska and Alberta. Area, 355,855 square miles; population, according to the census of 1921, 524,582 as compared with 392,480 in 1911. The census bureau estimate in 1928 was 585,000. The principal cities with their populations in 1921: Victoria, the capital, 38,727; Vancouver, 117,217; New Westminster, 14,495. The movement of population in 1926 was: Births, 9906; deaths, 5426, marriages, 4413. There is a complete system of free and non-sectarian education, ranging from primary to collegiate instruction. In 1926 there were 989 elementary schools with 2995 teachers and 89,909 pupils and 73 high schools, with 401 teachers and an enrollment of 11,779 pupils. The area of the timberland of British Columbia is estimated at more than 100,000,000 acres, containing roughly 400,000,000 feet of merchantable timber. The value of lumber, lath, shingles, and pulpwood in 1927 was \$83,087,000. The mineral resources are abundant. The value of the output in 1926 was \$67,188,842, as compared with \$60,729,358 in 1927. The leading mineral in value was lead. The other important minerals are coal, copper, gold, and silver. For figures pertaining to agriculture and manufacturing, see CANADA.

The 1926-27 budget figures showed a revenue of \$20,258,915 and expenditures of \$17,846,690. The public debt at the end of 1927 was \$75,485,736. The Government is under a lieutenant-governor and a legislative assembly of 48 members elected for five years. The province is represented in the Canadian Legislature by 6 members in the Senate and 14 members in the House of Commons. Lieutenant-Governor in 1928, Robert R. Bruce; Prime Minister, president of the council, and provincial treasurer, J. D. Maclean; Provincial Secretary, minister of mines, and commissioner of fisheries, William Sloan; Agriculture, E. D. Darrow; Education, finance, and industries, J. D. Maclean; Public Works and railways, W. H. Sutherland; Attorney-General and Minister of Labor, A. M. Manson; Lands, T. D. Pattullo.

BRITISH EAST AFRICA. A British possession covering a large area of Africa, and comprising KENYA COLONY, UGANDA PROTECTORATE, and ZANZIBAR. See these articles.

BRITISH GUIANA, gē-ā'nā. A British colony on the northeastern coast of South America, including the settlements of Berbice, Demerara, and Essequibo; bounded on the north by the Atlantic Ocean, on the east by Dutch Guiana, on the south by Brazil, and on the west by Venezuela. Area, 89,480 square miles; population, according to the census of 1921, 207,691, excluding about 9700 aborigines in the remoter

districts. An official estimate of the population in 1926 placed it at 306,844. In the same year the movement of population was: Births, 10,653; deaths, 7837. The capital is Georgetown, with a population of 57,063. Statistics on revenue, expenditure, and trade for 1925 and 1926 are:

	1925	1926
	£	£
Revenue	1,095,574	1,054,127
Expenditure	1,126,394	1,173,491
Imports	2,908,434	2,728,746
Exports	8,130,706	2,863,923

The chief pursuit is agriculture with leading products, sugar, rice, and coconuts. Stock raising is of some importance. The number of cattle in 1926 was 138,092; horses, 2190; sheep, 28,637; and goats, 15,504. The mineral resources are considerable, gold, rough diamonds, and bauxite being found in large quantities. The principal exports are sugar, rough diamonds, rice, timber, and rum; and the chief imports are flour, fertilizers, machinery and hardware, and textiles.

In 1926, 3160 vessels with a total tonnage of 1,090,806 entered and cleared the ports of British Guiana. Practically all the vessels were British and Dutch. There are 97½ miles of railroads. The colony is administered by a governor, assisted by a court of policy, consisting of seven official members and eight elected members, and a combined court, containing in addition to the above, six financial members elected by the registered voters. Governor, Sir Cecil Hunter Rodwell.

BRITISH HONDURAS, hōn-dōo'ras. A British Crown colony on the Caribbean coast of Central America, east of Guatemala, and 700 miles west of Jamaica. Area, 8598 square miles; population, according to the census of 1921, 45,317; estimated, Dec. 31, 1926, 48,584. The movement of population in 1926 was: Birth rate, 38.36 per thousand; death rate, 24.14 per thousand; marriages, 405. In 1926 there were 71 primary schools with an enrollment of 6900. The chief pursuits are agriculture and forestry although only a small part of the land is cultivated. In the higher lands good pasturage is to be found.

The chief exports are bananas, mahogany, cedar, and other forest products, plantains, coconuts, and chicle. The chief imports are clothing, cotton and silk goods, milk, flour, machinery, and hardware. The United States leads all other countries in respect both to imports and exports. The value of imports in 1926-27 was £1,042,317; exports, £808,393. The revenue in 1926-27 was £229,719 and the expenditures, £214,093. The public debt in 1926-27 was £327,559. The tonnage entered in 1926 was 316,663 tons. The administration is under a governor assisted by an executive council of six members and a legislative council of six official and seven unofficial members. Governor and Commander-in-Chief in 1928, Sir J. A. Burdon.

BRITISH INDIA. See, INDIA, BRITISH.

BRITISH MUSEUM. See ART MUSEUMS; and for *British Museum Expedition*, see ARCHÆOLOGY.

BRITISH NEW GUINEA. See PAPUA.

BRITISH NORTH BORNEO. A British colony, comprising the northern part of the island of Borneo. Area, about 31,106 square miles; population, at the census of 1921, 257,804, most of whom were Mohammedan settlers in the coast

regions and aborigines in the interior, the Europeans numbering only 533. The most numerous tribes were the Dusuns (112,287), Muruts (37,447), and the Bajaus (33,070). The chief towns are Sandakan, with a population of 11,936 on the east coast, and Jesselton, on the west coast.

Only a small part of the soil is arable. The principal products are: Timber, coconuts, rye, sago, gum, coffee, fruits, spices, gutta-percha, camphor, rattans and other forest products, and tobacco. Coal, iron, gold, and mineral oils are also to be found to some extent. The trade is chiefly carried on with Great Britain almost entirely through the ports of Hong Kong and Singapore. There is a railway 127 miles long running from Jesselton to Melalap, with a branch to Brunei Bay. Statistics of finance and trade for 1925 and 1926 were:

	1925	1926
	£	£
Revenue	399,559	434,336
Expenditure	270,022	273,119
Imports	854,399	970,319
Exports	2,083,800	1,987,233

The tonnage entering in 1926 was 429,126 tons. The territory is under the jurisdiction of the British North Borneo Company, and the administrative functions are exercised by a governor in Borneo and a board of directors in London. Governor in 1928, J. L. Humphreys.

BRITISH SOMALILAND. See SOMALILAND, BRITISH.

BRITISH SOUTH AFRICA. See SOUTH AFRICA, BRITISH.

BRITISH WEST AFRICA. The general name given to the following British colonies in West Africa; Nigeria (colony and protectorate); Gold Coast (comprising the Gold Coast colony, Ashanti, and the Northern Territories); Sierra Leone (colony and protectorate). See separate articles.

BROADCASTING. See RADIO TELEPHONY AND BROADCASTING.

BROCKDORFF-RANTZAU, brōk'dōrf-rān'-zhaw, COUNT ULRICH VON. German diplomatist, died at Berlin, September 8, while on leave of absence from his post as Ambassador to Moscow. He was born at Schleswig, May, 29, 1869. After studying law and serving in the army, he entered the German diplomatic service in 1894, holding minor posts at Brussels, St. Petersburg, Vienna, and The Hague. In 1909 he was appointed consul general at Budapest, and three years later was sent as ambassador to The Hague. In 1918 he was appointed foreign minister of the new German Republic. In May of the following year he headed the German delegation at Versailles, and, speaking before the Allied representatives, strenuously denied Germany's responsibility for the war. Refusing to accept the proposed peace terms and sign the treaty, he resigned with the Schiedemann cabinet on June 20, 1919. He became a member of the Democratic party, and was appointed, in 1922, Ambassador to Soviet Russia.

BROKERS' LOANS. See BANKS AND BANKING.

BRONSON, WALTER COCHRANE. American educator, died at Oxford, England, June 2. He was born at Roxbury, Mass., Aug. 17, 1862, and was educated at Brown University, the Harvard Divinity School, and Cornell University. He began his teaching career as professor of English

at DePauw University, 1890-92; in the latter year he became associate professor of English literature at Brown University and in 1895 he was made professor. He received the degree of Litt.D. from Colby College in 1904, and from Brown University in 1915. He wrote: *Short History of American Literature* (1900); *The History of Brown University* (1914), and edited *Poems of William Collins* (1898); *English Essays* (1905); *English Poems* (1907-10); *American Poems* (1912); *American Prose* (1916).

BROOKINGS INSTITUTION. An association established in 1927, in Washington, as the outgrowth of experimentation in research and training conducted there for some years by the Institute of Economics, the Institute for Government Research, and the Robert Brookings Graduate School of Economics and Government. The Institution is an amalgamation of these three agencies and is designed to cover eventually the entire range of social sciences, as well as to provide facilities for research and advanced research training in such subjects as economics, government administration, political relations, history, law, and social organization. It affords an opportunity for young graduate scholars to spend from one to three years in a well equipped research organization. In addition, it provides headquarters for visiting scholars from the United States and foreign countries, who come to the National Capital to make use of the great amount of material available there on economics, political, historic, social administrative, and legal problems, as found in the records of the various departments of the Government. Plans have been prepared for a group of attractive buildings to house the various activities of the Institution and an endowment of several million dollars has been assured for carrying on its work. The officers of the Board of Trustees in 1928 were: Chairman, Robert S. Brookings, the founder of the Institution; Vice chairman, Leo S. Rowe; Treasurer, Frederic A. Delano; President, Harold G. Moulton.

BROOKLYN INSTITUTE OF ARTS AND SCIENCES. An institution at Brooklyn, N. Y.; founded in 1824, composed of three divisions; Education, Museums, and a Botanic Garden. It was incorporated in its present form in 1890. Membership is open to all who are interested in any branch of science or art. The Institute is divided into the following departments, composed of members interested in a particular field: Agriculture, fine arts and architecture, astronomy, botany, dramatic art, electricity, engineering, home economics, music, pedagogy, philology, photography, physics, psychology, French language and literature. These departments conduct educational courses, addresses, lectures, and concerts. A forum conducted by the departments of political science and sociology provides for the discussion of current problems. The enrollment in the School of Pedagogy in 1928 was 1700; the attendance at lectures, 308,248; and at all other activities, 961,875. The Museum of the Institute contains collections in the fields of art, ethnology, and natural science, and the Botanic Garden comprises over fifty acres. Attendance at the Museums was 761,681; at the Botanic Garden, 1,101,653. The library contained over 26,000 volumes. In 1928 the permanent funds totaled \$2,670,413, and those to meet current expenses, \$696,680. The president of the board of trustees

was Frank L. Babbott; director of the department of education, Charles D. Atkins; of the Museum of Arts and Sciences, William Henry Fox; and of the Botanic Garden, C. Stuart Gager. Headquarters are at the Brooklyn Academy of Music, 30 Lafayette Avenue, Brooklyn, N. Y.

BROOKLYN MUSEUM. See ART MUSEUMS.
BROOKWOOD LABOR COLLEGE. See LABOR, AMERICAN FEDERATION OF.

BROWNELL, WILLIAM CRARY. American critic and author, died at Williamstown, Mass., July 22. He was born at New York, Aug. 30, 1851, and was graduated from Amherst College in 1871. He was for two years art critic of the *Nation* (New York), 1879-81, and from 1890 until his death he was literary adviser of Charles Scribner's Sons. For many years he occupied a foremost place among American critics of art and letters, and in his latter years was generally recognized as the dean of his profession. He was called the direct inheritor of the line of critics to which belonged, in England, Walter Pater and Matthew Arnold, and, in America, Emerson and Lowell. His pronouncements on literature and life, based on his comments on the works of English, American, and French writers, were widely read and were quoted as the judgments of a wise and scholarly and thoroughly informed mind. His treatment of French life was recognized as remarkably subtle and sympathetic, and of French art as very suggestive from a nonprofessional point of view. His studies of the later English prose writers have been highly praised. He was a member of the American Academy of Arts and Letters. Dr. Brownell, who received the degrees of L.H.D. (1896), Litt.D. (1910), and LL.D. (1916) from Columbia University, wrote: *French Traits*, an essay in comparative criticism (1889); *French Art* (classic and contemporary painting and sculpture, 1892); *Newport* (1896); *Victorian Prose Masters* (1901); *American Prose Masters* (1909; new edition, 1923); *Criticism* (1914); *Standards* (1917); *The Genius of Style* (1924); *Democratic Distinction in America* (1928).

BROWN UNIVERSITY. An institution of higher education at Providence, R. I., founded in 1764. In the autumn of 1928 the enrollment was 2299, of whom 275 were graduate students; 1324 undergraduate men, including 275 seniors, 246 juniors, 392 sophomores, 388 freshmen, and 23 specials; 500 undergraduate women; and 100 school of education students. The faculty of 204 included 109 professors, 37 instructors, and 58 assistants. The permanent productive funds of the University amounted to \$9,405,032, of which \$8,931,612 was an endowment of the Men's College, \$473,419 an endowment of the Women's College, and the total income from these funds was \$510,394. The library contained 350,000 volumes. Among the appointments on the faculty in 1928 were the following: Henry B. Gardner, as professor emeritus of economics; Ralph Eastman Badger, as professor of economics; Samuel McClellan Butt, as acting associate professor of philosophy; Alfonso de Salvo, as professor of Romance languages, and William Leopold Fichter as associate professor in the same department; and James Quayle Dealey, as professor emeritus of social science. In October, 1928, the Rev. Dr. Clarence A. Barbour, of the class of 1888, president of Colgate-Rochester Divinity School at Rochester, New

York, was elected to the presidency of the University, to succeed Dr. Faunce, whose retirement was to take effect in June, 1929. President, William Herbert Perry Faunce, D.D., LL.D.

BRUNEI, brōō-y'. A British region on the northwestern coast of the island of Borneo. Area, about 2500 square miles; population, according to the census of 1921, 25,444, of whom the Europeans numbered only 35, the bulk of the population being made up of Malays and native Borneans. Brunei is the chief town with a population of about 10,000. Among the principal products may be mentioned mangrove extract, rubber, coal, sago, and jelutong. Cloth weaving, silverware, brass founding, and boat building are found among the native industries. In 1927 the chief exports were cutch, coal, rubber, jelutong, and forest products; the chief imports, rice, tobacco, kerosene, oil, piece goods, and sugar. The revenue in 1926 was £42,857; expenditure, £34,754; public debt, Dec. 31, 1926, £49,525. The administration is in the hands of a British Resident, the sultan retaining the name only and with his two principal ministers receiving a subsidy from the British Government. Sultan in 1928, Ahmed Tajudin Tkhazul Khairi Wadin, a minor, who succeeded his father in September, 1924. British Resident in 1928, E. E. F. Pretty.

BRYAN TREATIES. See **ARBITRATION**, **INTERNATIONAL**.

BRYN MAWR COLLEGE. An institution for the higher education of women at Bryn Mawr, Pa.; founded in 1880. The enrollment for the autumn of 1928 totaled 494, of whom 385 were undergraduates, distributed as follows: Seniors, 61; juniors, 95; sophomores, 99; and freshmen, 128; 3 were hearers; 20 resident fellows, and 88 graduate students. The teaching staff numbered 79. The productive funds of the college amounted to \$6,481,000 in the autumn of 1928 and the income for the year 1927-28 to \$1,028,602. The number of volumes in the library was 120,500. Goodhart Hall, a students' building and auditorium was completed in June and dedicated at the close of the college year. The outstanding academic change of the year 1927-28 was the provision which permitted students to read for honors. President, Marion Edwards Park, Ph.D., LL.D.

BUCKLAND, LORD, FIRST BARON BUCKLAND OF BWLCH (HENRY SNEYMOUR BERRY). English capitalist, died at Buckland, Bwlch, Wales, May 23. He was born Sept. 17, 1877. He began his career as a school teacher, but soon became interested in finance. He was associated closely with the late Lord Rhondda in the management of his collieries. Eventually he was made chairman or director of more than fifty companies, and managed most of Lord Rhondda's business affairs. He was created Baron Buckland in 1926. He was a brother of Sir William and Sir Gomer Berry, British newspaper proprietors.

BUCKNELL UNIVERSITY. A coeducational Baptist institution of higher learning, at Lewisburg, Pa., founded in 1846 under the name of the University of Lewisburg, but renamed in 1886 in honor of its benefactor, William Bucknell. In the autumn of 1928 the enrollment was 1097, of whom 705 were men and 392 were women. Of the 318 students enrolled in the summer session of 1928, 162 were men and 156 were women. The faculty numbered 71, the productive funds amounted to \$1,700,000, and the

income for the year to \$554,000. Work was offered in liberal arts, biology, education, commerce and finance, and engineering. A new botany building with a large greenhouse, and a new dining hall for women, accommodating 500 students, were erected by the University during the year. President, Emory W. Hunt, D.D., LL.D., D.C.L.

BUCKWHEAT. The production of buckwheat in the United States in 1928, as estimated by the Department of Agriculture, amounted to 13,163,000 bushels on 750,000 acres, the average yield per acre being 17.6 bushels. In 1927 the production was 15,755,000 bushels, the area 810,000 acres and the average yield 19.5 bushels per acre. The average production for the five years ending 1928 was 13,711,000 bushels. On the basis of the average farm price of 87.6 cents per bushel on December 1, the total value of the crop of 1928 was \$11,525,000 as compared with \$13,155,000, the total value of the preceding crop with a corresponding price per bushel of 83.5 cents. The yields of the leading buckwheat growing States were reported as follows: Pennsylvania 3,802,000 bushels, New York 3,475,000 bushels, Minnesota 1,074,000 bushels, West Virginia 800,000 bushels, Michigan 720,000 bushels and Ohio 700,000 bushels. The average yield per acre in the 23 States reporting buckwheat production ranged from 9.6 bushels in Nebraska to 24 bushels in Vermont and the average farm price per bushel from 67 cents in South Dakota to \$1.05 in Vermont. The yields in New York and Pennsylvania were reduced by dry weather and frost, which also lowered the quality to some extent. During the year ended June 30, 1928, the United States exported 554,000 bushels of buckwheat and imported 3,412,000 pounds.

BUENOS AIRES. See **STRIKES AND LOCK-OUTS**.

BUILDING. A summary of building-permit values for 204 cities in the United States for the calendar year, 1928, made by *Bradstreet's* indicated that the aggregate of the permitted value in that year was \$3,237,850,759, or a decrease of 3.1 per cent from the corresponding figure of \$3,342,360,533 in 1927, of 13.6 per cent from \$3,746,102,782 of 1926, and of 16.6 per cent from the peak year of 1925 when the figure was \$3,883,172,225. While building-permit values in the City of New York gained 5.8 per cent over 1927, the total at the other cities decreased 6.3 per cent. The only increase for the year was in a Southern group of cities, amounting to 8.1 per cent, aside from a small fractional gain in the Middle Atlantic group of cities. In four of the five boroughs of Greater New York, Richmond (Staten Island) being excluded in 1928, building-permit values amounted to \$918,027,238 as compared with \$870,108,777 in 1927, and the record of \$1,031,441,405 in 1926.

The 1928 construction volume in the United States according to the F. W. Dodge Corporation's Review of Building and Engineering Activity, was the highest in its history. Contracts let on new building and engineering works in 37 large cities east of the Rocky Mountains reached a total of \$6,628,286,100 in 1928, as indicated in the accompanying table, a figure 5 per cent ahead of the total for the year 1927 and 4 per cent in excess of the total for 1926 which was the previous high record in this field. The territory covered in the 37 Eastern States represented in this survey was about 91

per cent of the total construction of the United States.

In New York State and northern New Jersey during the year 1928, there was \$1,814,316,800 worth of new contracts let on new building and engineering construction, an amount showing an increase of 8 per cent over 1927. The New England States had a total construction volume of \$495,581,000 as compared with the total of \$412,767,300 for the year 1927, an increase of 20 per cent. In the Middle Atlantic States the year's new construction was \$787,672,800 or a gain of 9 per cent over 1927. In the Central West, Illinois, Indiana, Iowa, Wisconsin, southern Michigan, Missouri, Kansas, Oklahoma, and Nebraska, new construction in 1928 was represented by contracts to the amount of \$1,934,774,900 as compared with \$1,812,848,700 for 1927, or an increase of 7 per cent. In the Northwest, Minnesota, the Dakotas, and Northern Michigan, the year's total was \$80,190,700, or a loss of 4 per cent in 1927. In the Southeastern States new construction started in 1928 reached a total of \$560,925,400, being a loss of 8 per cent from the corresponding amount in 1927. In Texas the new construction started in 1928 amounted to \$231,408,800, being a gain of 6 per cent over the amount started in 1927.

training and instruction of teachers. The State University at Sofia had 298 professors and teachers and 3062 students in 1926-27. There is also a free (private) university with 44 teachers and 2029 students.

PRODUCTION. The principal occupation of the people of Bulgaria is agriculture. The land is held in absolute freehold, the greater part of the holdings being under small proprietors (1 to 6 acres). The methods of cultivation are primitive, although in recent years some modern farm machinery has made its appearance. Preliminary results for 1927 showed an improvement over 1926 in the yield of most crops, with the exception of tobacco and corn. The smaller crop of tobacco was the effect, in part, of a reduction in sown area; in the case of corn the sown acreage was larger, but adverse weather reduced the yield. Although most crops were larger than in the preceding year, the decreases in corn and tobacco are significant because of their importance in the exports of the country; in 1927 these two products represented approximately 30 per cent of the total value of exports.

Estimates of agricultural production during 1927 (1926 figures in parentheses) are as follows: wheat, 1,288,580 metric tons (994,590);

BUILDING AND LOAN ASSOCIATIONS. See COÖPERATION.

BULGARIA. A constitutional monarchy in the Balkans lying to the south of Rumania and the east of Jugo-Slavia. Capital, Sofia.

AREA AND POPULATION. As a result of the World War, the area of Bulgaria was reduced from 53,305 to 39,814 square miles. The population according to the census of 1926 was 5,483,125 as compared with the actual population, according to the census of 1920, of 4,846,971. The chief cities with their populations, according to the 1926 census are: Sofia, 213,162; Philippopolis, 85,188; Varna, 60,787; Ruschuk, 45,672; Slivno, 29,335; Plevna, 29,063; Stara Zagora, 28,929; Choumen, 25,816; Burgas, 31,428.

EDUCATION. Primary instruction is free and compulsory for children between the ages of 7 and 14, and is supported by the State authorities. In 1926 there were 4115 national elementary schools with 12,419 teachers and 391,763 pupils and 1570 private elementary schools with 2490 teachers and 70,208 pupils. Secondary and higher schools are gymnasiums and progymnasiums, and various institutions for special

tobacco, 15,794,500 kilos (27,189,100); corn, 523,610 metric tons (693,765); barley, 305,700 metric tons (241,340); rye, 209,370 metric tons (181,195); sugar beets, 242,050 metric tons (224,895); silk cocoons, 2,025,000 kilos (1,863,360); sunflower, 35,680 metric tons (11,582); attar of roses, 504,631 miskals (282,848); (1 miskal equals 0.16953 ounces avoirdupois.) The Bulgarian production of silk cocoons for 1928 was estimated at about 1,900,000 kilos, as against 2,025,000 in 1927 and an average of about 1,520,000 for the previous five years. The smaller production in 1928 was only a casual incident, due to climatic causes, larger quantities of silk-worm eggs having been used than in 1927.

The total area sown was slightly larger in 1927 than in 1926, the increase occurring chiefly in corn and sunflower acreage. Corn acreage increased from 601,000 hectares to 653,000 hectares in 1927, and sunflower from 15,250 to 44,900 hectares, whereas tobacco decreased from 31,540 hectares to 25,640. The area sown to wheat declined from 1,046,000 to 1,018,000 hectares but other crops showed only slight changes.

The output of manufactured tobacco during the year was 4600 metric tons, as against 4690 metric tons in 1926. Nevertheless, the value returned to the State monopoly was slightly larger, amounting to 695,610,000 leva as compared with 675,941,200 leva in 1926. Production of sugar exceeded that for the previous year, totaling 38,390 metric tons as against 32,060 metric tons. Coal, the principal mineral of the country, has registered a steady increase during recent years. The output in 1927 reached 1,237,650 tons, as compared with 1,205,760 tons in 1926.

COMMERCE. Foreign trade in 1927, for the first time since 1922, showed an excess of exports over imports, the result of an increase in exports rather than a restriction of imports.

principal items were attar of roses, skins, hides and furs, nuts, and cocoons.

FINANCE. Since the war the Bulgarian budget totals have increased steadily, approximately in proportion to the decline of lev exchange. In gold value they have averaged, roughly, about 20 per cent above 1914. Under the recommendations of the finance committee of the League of Nations, a reorganization was being carried out to simplify the budget. Hitherto, it had been customary to issue extraordinary and supplementary budgets and to maintain an independent budget of special funds. It was proposed to unify these in a single statement, and to some extent this had been accomplished in the proposal for the fiscal year 1928-29. The further recommendations of the finance committee, that

Germany was again the leading country of origin for Bulgarian imports, supplying 21.1 per cent of the total as compared with 21.9 per cent in 1926; Italy was second with 14.6 per cent (13.8 in 1926); followed by England, 12.1 (11.3); Czechoslovakia, 9.8 (12); and Austria, 8.2 (8.7). Exports went chiefly to Germany, which took 23.1 per cent, as against 19.5 per cent in the previous year; Austria was next with 16 per cent (7.6 in 1926); followed by Greece, 14.8 (17.4); Italy, 7.3 (12); and France, 5.7 (5.7). Imports from the United States in 1927 totaled 96,841,000 leva, as compared with 85,894,000 leva in 1926—an increase of about 13 per cent, whereas total Bulgarian imports during the year showed a slight decrease. Purchases from the United States include chiefly machines and implements, mineral oils, gums, metals, manufactures, etc. Exports to the United States were valued at 68,260,600 leva, as against 95,635,000 leva in 1926. The

expenditures should be reduced to 6,750,000,000 leva in 1928-29 and that in future the ministries should make expenditures from month to month under the budget only to the extent to which funds are actually available in the treasury, have also been adopted. With the exchange practically stable for three years, there had been a tendency to reduce estimates of expenditures.

The budget for 1928-29, as voted by Parliament, showed a decrease from the previous year in both revenues and expenditures. Revenues were estimated at 6,788,000,000 leva and expenditures at 6,747,000,000 leva, as against a balance of expenditure and income of 6,993,000,000 leva for 1927-28. Budget operations for the fiscal year 1927-28 closed with a surplus of 238,270,000 leva, after deducting extraordinary credits, according to the minister of finance. Regular budget receipts totaled 6,637,214,000 leva and expenditures 6,222,360,000 leva, or a surplus

of 464,854,000 leva, while extraordinary operations showed a deficit of 226,584,000 leva.

COMMUNICATIONS. All railways in Bulgaria are owned and operated by the State under the title Bulgarian State Railways, with the exception of a few miles owned and operated by timber companies. In 1927 Bulgaria had 1419 miles of railway of standard gauge and 232 miles of narrow gauge. The state railroads during 1927 transported 317,000 carloads, as against 313,000 carloads in 1926. During the year special efforts were made by the Government toward development of the railway system and, in a general way, of roads and communications. On Nov. 20, 1927, the 40-kilometer railway line from Lovetch to Levsky on the trunk line from Sofia to Varna was opened. Another line, about 23 kilometers in length, to connect the station of Rakovsky (on the trunk line from Sofia to Constantinople) with the town of Haskvo (on the slopes of the Rhodopes Range), was under construction. This line was being constructed from funds obtained under the refugee loan. See preceding YEAR BOOK.

The number of ships calling at the principal ports of Bulgaria in 1927 showed a decline from 1926. At Varna, 459 ships of 644,106 tons called during 1927, as against 474 ships of 645,105 tons in 1926; the respective figures for the port of Burgas were 455 of 765,036 tons, and 484 of 827,000 tons.

GOVERNMENT. The King is the head of the Government, assisted by a council of ministers nominated by him and a single legislative chamber known as the Sobranje composed of 273 members. In 1928 the King was Boris III, who succeeded to the throne upon the abdication of his father, Oct. 3, 1918. The parties in the Sobranje, elected in May, 1927, contained the following party groups: Government Coalition, 168; Agrarians, 48; Macedonian Independents, 11; National Liberals, 14; Democrats, 12; Radicals, 2; Social Democrats, 10; others, 8. The ministry as organized at the beginning of 1926 was as follows: Premier and Minister of Interior, A. Liapcheff; Education, N. Naidenoff; Justice, Dr. T. Kuleff; Commerce, T. Bobotchevsky; Finance, V. Moloff; Public Works, S. Vasileff; Ports and Railways, N. Naidenoff; Foreign Affairs, A. Buroff; Agriculture, D. Christoff; War, General Ivan Volkoff.

HISTORY. While outwardly, at least, Bulgaria seemed to pass through as quiet a year as that which prevailed in 1927, there was the continual threat of trouble at the hands of the Macedonian comitadjis who did not seem to fear the government of Premier Liapcheff to any great degree. It was felt in many sections of Europe that he was unable to cope with the Macedonian rebels and was just coasting along toward a catastrophe which might involve Jugo-Slavia which took the precaution during the year to close its frontiers to Bulgarian subjects. Bulgaria was also told by M. Briand, as president of the Council of the League of Ambassadors, that he did not believe the country was living up to the provisions of the Treaty of Neuilly with regard to disarmament. M. Briand hinted that in accordance with the terms of the treaty, an investigation might be made if the League Council deemed it necessary. No action along these lines was taken during the year, however. In the late autumn there were reports in the press, which were denied by Bulgarian authorities to the effect that the

Macedonian rebels were planning to march on Sofia in order to gain their ends.

BULGARIAN EARTHQUAKE. See EARTHQUAKES.

BULKLEY, LUCIUS DUNCAN. American dermatologist, died at Englewood, N. J., July 20. Born at New York, Jan. 12, 1845, he was graduated from Yale in 1866, and from the College of Physicians and Surgeons of Columbia in 1869. He continued his medical studies abroad, specializing in dermatology. On his return to the United States he practiced in New York City and was one of the founders of the New York Skin and Cancer Hospital, where he remained as trustee and attending physician. In 1894 he became consulting physician at New York Hospital, and was consulting dermatologist at Randall's Island Hospital, at the Hospital for Ruptured and Crippled, and at the Manhattan Eye and Ear Hospital. Dr. Bulkley was president of the New York Academy of Medicine in 1897. He wrote: *Manual of Diseases of the Skin* (1898); *Eczema and Its Management* (1881); *Acne and Its Treatment* (1885); *Syphilis in the Innocent* (1894); *Compendium of Diseases of the Skin* (1912); *Diet and Hygiene in Diseases of the Skin* (1913); *Cancer, Its Cause and Treatment* (Vol. I, 1915, Vol. II, 1917); *The Medical Treatment of Cancer* (1919); *Cancer and Its Non-Surgical Treatment* (1921); and *Cancer of the Breast* (1925).

BUNT. See BOTANY, under *Plant Diseases*.

BURMA. The largest and most easterly province of British India; since 1923, a governor's province under the Government of India Act of 1919. Area, 262,732 square miles; population (1921), 13,212,192. Kangoon, with a population of 345,505, is the capital of Lower Burma; and Mandalay, with a population of 148,917, is the capital of Upper Burma. Politically Burma is a province of British India, but geographically and socially it may be regarded as a separate unit having little in common with India proper. Being almost entirely agricultural, it does not share the rest of the country's industrial ideas. Such industries as Burma has are those essential for the preparation of its products for the market—rice mills for husking rice, sawmills for squaring its teak, refineries for oil, and cotton gins. Rice mills alone make up about three-fifths of its total industrial activity. The principal crop is rice, two-thirds of Burma's agricultural area being given to its culture. In poor years most of the crop is consumed locally, leaving but little surplus for export. The government is administered by a governor and legislative council. Governor in 1928, Sir Charles A. Innes.

BURNET, JOHN. British Hellenist, died at London, May 26. He was born at Edinburgh, Dec. 9, 1863. He studied at the University of Edinburgh and at Balliol College, Oxford. In 1888 he became an instructor at Harrow School and in 1890 was appointed a fellow of Merton College, Cambridge. From 1892 until his retirement as professor emeritus in 1926 he was professor of Greek at the University of St. Andrews. In 1925 he visited the United States as Sather Professor of Greek at the University of California, which added its LL.D. to Professor Burnet's long list of honorary degrees. He was called the foremost Greek scholar of Great Britain. He published *Early Greek Philosophy* (1892; 2d ed., 1908; 3d ed., 1920), called a most excellent treatise, and

following in general the lines of Zeller's *Philosophie der Griechen*; and *Greek Rudiments* (1897); *The Ethics of Aristotle* (1899); *Aristotle on Education* (1903); *Platonis Opera* (5 vols. 1899-1907); *Plato's Phædo* (1911); *Euthyphro*, *Apology* and *Crito* (1914); *Greek Philosophy*; *Part I, Thales to Plato* (1914); *Higher Education and the War* (1917). His *Early Greek Philosophy* was translated into German, 1913, and into French, 1919.

BUSINESS REVIEW. The year 1928, so far as the development of business is concerned, may be roughly divided into three periods, the first comprising the five months January to May inclusive, the second the months June to September, and the third the remaining three months of the year. During the first period, there was a continuation of the unfavorable condition which had developed during the latter part of 1927. Unemployment was general and severe during the forepart of the year, with many plants unoccupied or running on short time. Car loadings were low, and the total output of manufactured goods was less than average. During the second period, there was a gradual change for the better, hardly masked by the comparative midsummer quiet which usually prevails in a good many lines of business. With the opening of the autumn, business in most lines began to feel the impetus of a new demand, and to go ahead rapidly. Large orders were placed with factories in most branches of business, carloadings greatly increased, and there was a general improvement in almost every kind of distributive business. As a result, the last three months of 1928 quite fully made up for the shortages which had been developed during the forepart of the year, with the outcome that total figures for 1928, both as regards turnover, volume of production, and earnings, showed a level fully up to that of 1927, and in some cases (as particularly in the case of earnings, especially with the larger companies), very much better results than those of the preceding year. The accompanying table exhibits the tendencies of industrial production during the past few years, and shows the steady upward movement of activity during 1928 especially during the last one-third of that period.

INDEX OF INDUSTRIAL PRODUCTION
[Index numbers, adjusted for seasonal variations
1923-1925 average=100]

Month	1922	1923	1924	1925	1926	1927	1928
January	73	100	100	105	106	107	106
February	76	100	102	105	107	109	109
March	80	103	100	104	107	111	109
April	77	107	95	103	107	109	109
May	81	107	89	103	106	111	109
June	86	105	85	102	107	108	108
July	86	103	83	103	107	106	109
August	84	102	89	103	111	107	112
September	88	100	94	102	112	105	114
October	94	99	94	105	111	103	114
November	97	97	97	106	108	99	112
December	100	96	101	108	105	99	112
Annual index	85	101	95	104	108	106	110

As already indicated, the improvement in production also held good of distribution, consumptive demand being strong, so that the output of factories passed directly into actual use. Thus the chain stores and other distributing enterprises showed unusual sales and profits, while export and import business was exceptionally good, and most of the indications of business activity reported in higher figures. Comparatively little accumulation of goods was shown

by inventory and other statements at the close of the year, so that, despite the great increase in activity during the last three months, stocks, which had been small at the close of 1927, were still further reduced, the result being a correspondingly greater probability of advance in activity during the early months of 1929. It was a common observation that consuming power and disposition to buy had seldom been stronger at the close of the year than was true at the end of 1928 as was indicated by a record breaking holiday trade.

COMMODITY PRICES. At the opening of the year 1928, commodity prices had for some months past been very nearly stable. This general tendency toward stability was well maintained during the early part of the year, wholesale figures showing at first a slight falling off from the latter part of 1927 followed then by rather decisive recovery after the turning point in business activity had been reached. High point was reached in September, after which there was a slight reduction, as mass production came into full effect once more, and commodity output caught up with demand. Thereafter, and during the autumn, prices again remained substantially stable, and closed the year on a level about the same as that of the corresponding period in 1927. The actual index numbers for all commodities, with comparative figures for 1926 and 1927 were as follows:

MOVEMENT OF WHOLESALE PRICES

	1927		1928
January	96.6	January	96.3
February	95.9	February	96.4
March	94.5	March	96.0
April	93.7	April	97.4
May	93.7	May	98.6
June	93.8	June	97.6
July	94.1	July	98.8
August	95.2	August	98.9
September	96.5	September	100.1
October	97.0	October	97.8
November	96.7	November	96.7
December	96.8	December	96.7

Changes in wholesale price figures classified by groups showed that during the year the strongest upward tendencies were displayed in farm products, metals and metal products, and in foodstuffs. Special upward tendencies were registered in steel, iron, and some of the non-ferrous metals in which producers' combinations had been formed with a view to controlling the situation. The farmer was better off, not only on account of larger foreign demand, but also because of a distinct advance toward diversification of his product. Avoidance of overproduction in some branches, which had been rather unduly emphasized during preceding years, also helped him in a measure, to get a more evenly-distributed valuation for his goods. Unexpectedly large yields in some crops, which had been thought to be rather unfortunately situated, however, put the prices of farm products down during the latter part of the year, beginning with October. Thus it is only when general averages are considered, that the year 1928 can be said to have exhibited a really stable price level. See AGRICULTURE.

MANUFACTURING. For reasons already briefly indicated, manufacturing, generally speaking, was very much more active and better off than had been the case during the preceding year. Indexes of production and manufacture showed the aggregate figures already cited at the beginning of this article, while for minerals the advance was

even more striking, the composite index for minerals going from 103 in January 1928 to 114 in December. Even bituminous coal advanced from 92 to 99 while the copper output rose from an index of 102 to the index of 128. Silver, on the other hand, fell off sharply. Factory employment showed an advance of from 87.9 to 92 at the close of the year, and in some special branches, such as automobiles, the advance was very marked, the latter line advancing from 114.0 to 152. Most satisfactory was the increase in metals which advanced from a low point of about 80.9 early in the year to better than 90 toward the end of the year. Textile industries for the first time in several years seemed to show a decided turn for the better, toward the end of the year, both in cotton and in wool. The rayon industry continued to report remarkable expansion. The total number of automobiles produced was estimated at 4,630,000 as compared with 3,395,000 in 1927 and about 4,298,000 in 1926. Indexes of payrolls also showed distinct advance, the composite index for the year revealing a growth of about 5 per cent. The only classes of industry in which wages tended lower were textiles, and a few branches of mining, notably coal.

AGRICULTURE. Agriculture was in many ways more prosperous and satisfactory than for some years past. Not only was the yield of crops generally good, but the prices realized were distinctly better than those of 1927. During the fore part of the year, weather conditions were not altogether favorable, and the impression prevailed that the yield would not be good. During the summer, decided improvement took place in staples, and the autumn season was generally favorable, with the result that the yields in nearly all crops were above forecasts, while the price-increase was more evenly distributed among the major crops than in former years. The total value of fifty principal crops as estimated by the Department of Agriculture was about \$8,456,052,000 a decrease of \$65,511,000 or only 0.8 per cent below the preceding year of 1927. See **AGRICULTURE**.

Changes in farm values of principal crops were officially given as follows:

Crop	Change from 1927 to 1928 in			Thousands of dollars
	Physical Production	Per cent	Value	
Corn	+ 2.8	++ 6.8	++	135,232
Oats	+ 22.6	++ 11.5	++	60,912
Cotton	+ 10.9	++ 1.7	++	21,704
Cottonseed	+ 11.0	++ 9.4	++	19,997
Barley	+ 34.3	++ 9.4	++	16,928
Apples	+ 49.5	++ 8.0	++	15,732
Oranges	+ 37.3	++ 4.6	++	15,700
White potatoes	+ 14.9	-- 35.7	--	138,698
Wheat	+ 2.8	-- 10.5	--	102,620
Hay	+ 14.1	-- 5.6	--	79,798
Tobacco	+ 13.3	-- 1.0	--	2,560
Total, 50 crops..	+ 3	-- 0.8	--	66,511

In several of the Northwestern States, where a one-crop system had exerted an injurious effect for many years past, very decided betterment was noted as the outgrowth of a more rational system of cultivation.

Partly owing to this growth of diversification, and partly to the greater prosperity of farmers, resulting from the better general conditions and higher prices, sales of merchants in the country districts were very much more satisfactory than in the preceding year, while payments were more promptly met. The liquidation of obligations due

to banks, which had made considerable progress in 1927, was still further advanced during 1928. One result was to bring about a substantially better banking situation, with a very great reduction in the number of failures, especially among country banks, the number, 49, being the lowest for several years past.

GENERAL BUSINESS. General business showed an excellent condition, taken as a whole, for the year. While the first three months was unsatisfactory, on account of the continued depression in manufacturing to which reference has already been made, the loss of ground was quite speedily made up during the latter part of the year. Federal Reserve indexes of wholesale distribution, although reflecting a falling off up to the middle of the year, thereafter showed a strong improvement, with increasing indexes up to the end of December. Among the lines which reflected particularly good increase in purchasing power were foodstuffs, women's clothing, hardware, and furniture. The better distributive demand was also reflected in earnings. Compilations made by the Federal Reserve banks of some two hundred representative corporations showed a large gain as compared with 1927 amounting to near 35 per cent in the final quarter. As in 1927 the improvement in earnings was far from regular, the greatest gains being found in those particular branches of business which were under the control of price combinations or in public utilities whose returns were independent of changes in prices. The tendency toward stability or decline of prices naturally helped such concerns quite materially. Thus the railroads showed an increase of about \$100,000,000 over 1927, partly the result of more intensive operation of their mileage, and partly the result of very decided improvements in management and operation. For the year as a whole, the net revenues of class 1 railroads which were \$1,085,485,000 advanced to \$1,193,133,741, an increase of about 10 per cent, reflecting a very similar condition in general business upon which, of course, the roads are dependent for their own prosperity.

BUSINESS FAILURES. A striking feature of the financial and economic situation of recent years has been afforded by the high percentage of business failures which has made itself apparent, and which represents the squeezing out of small businesses, either through mergers, absorptions, or actual collapse through bankruptcy. Many factors are now tending to enlarge the size of the business unit, and the tendency to a high failure ratio furnishes a good index of the intensity of the movement. The heavy mortality among the smaller enterprises continued unabated, and while there was a decided slowing up of failures among small banks for special reasons, this was an exception to the general rule of susceptibility to causes tending to wipe out the weaker enterprises. The general facts in the situation are set forth in the table on page 123.

BUTLER, THOMAS S. American Congressman, died at Washington, D. C., May 26. He was born in Chester County, Pennsylvania, Nov. 4, 1855, and was educated at the Normal School, West Chester, Pa. He was admitted to the bar of Chester County, and for several years was judge of the Fifteenth Judicial District of

Pennsylvania. He was elected to the national House of Representatives in 1897; at the time of his death he was the oldest member of the house in point of continuous service. Mr. Butler was chairman of the House Naval Affairs Committee and one of the foremost advocates of military preparedness for National defense.

BUTTER. See DAIRYING.

BYRD ANTARCTIC EXPEDITION. See POLAR RESEARCH.

BYRNE, DONN. (BRIAN OSWALD DONN-BYRNE). Irish-American novelist, died in an automobile accident near his home in Ireland, Coolmain Castle, Bandon, County Cork, June 18. He was born at New York, Nov. 20, 1889, of Irish parents sojourning temporarily in America. He was educated at University College, Dublin, and at Paris and Leipzig. On his return to New York he was connected with the New York Sun and the Brooklyn Daily Eagle. Even though Donn Byrne said of his own writing, "Its faults are because I cannot write better yet," and though that was perhaps true, he caught, in his contributions to magazines and in his books, a beauty which is haunting and elusive. He was called sometimes "the last of the traditional Irish story-tellers." He wrote: *Stories Without Women; The Strangers' Banquet; The Foolish Matron; The Woman God Changed; Messer Marco Polo; The Wind Bloweth; Changeling; Blind Raftery and His Wife; O'Malley of Shanganagh; Hangman's House; Brother Saul, and Cousader, Destiny Bay.*

CADORNA, kâ-dôr'nâ, MARSHAL COUNT LUIGI. Commander of the Italian Army during the World War, died at Bordighera, Italy, December 21. Born at Pallanza, in 1850, the son of Gen. Raffaele Cadorna, he was graduated from the Turin Military Academy in 1868, and entered the Army. Commissioned colonel in 1892, he became commander of the Tenth Regiment of Bersaglieri, and chief of staff of the Army of Florence. He was made major general in 1898, and put in command of the divisions at Naples in 1907, and at Genoa in 1910. The following year he was named commander of the Army in case of war, and later, as chief of the general staff, he undertook to prepare the Army for participation in the World War. When Italy entered the war in May, 1915, Marshal Cadorna's objectives were to protect the northern frontier of Italy, and to cross the Isonzo River and capture Trieste; he accomplished the former plan, but was unable to succeed in the offensive. The Italians captured Görz, however, in 1916, and advanced over the Corso plateau toward Trieste, but on Oct. 21, 1917, the German and Austrian lines, strengthened by troops recalled from Russia, began a counter attack toward Caporetto, forcing the Italian Army, which had not received the expected Allied support, to retreat. When the Central armies advanced as far as the Piave River, Marshal Cadorna, who before the defeat had been considered an inspired strategist, was succeeded by Marshal Armando Diaz, in December, and transferred to the military council at Versailles. Having been subsequently declared, by an investigating commission, largely responsible for the defeat, he was retired with the rank of lieutenant-general in February, 1918. After the War feeling grew calmer, and it was recognized that the weakness was not in an individual, but in the fact that, previous to the battle of Caporetto, there had been insufficient coöperation

between the Allied forces. Animosity toward Marshal Cadorna ended when Mussolini, who had become dictator Oct. 3, 1922, created the rank of Field Marshal, in order to honor Cadorna and Diaz alike. Once more active in military affairs, Marshal Cadorna worked until his death for the reorganization of the Army.

CAISSONS. See BRIDGES.

CALIFORNIA. POPULATION. According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 3,426,861. The estimated population on July 1, 1928, was 4,556,000. The capital is Sacramento.

AGRICULTURE. The following table gives the acreage, production, and value of the principal crops in 1927 and 1928.

Crop	Year	Acreage	Prod. bu.	Value
Hay	1928	1,804,000	5,284,000 ^a	\$75,538,000
	1927	1,796,000	5,332,000 ^a	65,946,000
Barley	1928	1,044,000	31,842,000	22,926,000
	1927	994,000	27,335,000	25,422,000
Wheat	1928	780,000	16,380,000	19,328,000
	1927	812,000	13,642,000	16,098,000
Rice	1928	133,000	8,073,000	7,104,000
	1927	160,000	8,960,000	10,804,000
Cotton	1928	223,000	155,000 ^b	15,112,000
	1927	130,000	91,000 ^b	9,555,000
Corn	1928	75,000	2,400,000	2,520,000
	1927	77,000	2,464,000	2,661,000
Potatoes	1928	56,000	7,728,000	5,023,000
	1927	52,000	7,956,000	7,558,000
Sweet potatoes	1928	12,000	1,152,000	1,267,000
	1927	12,000	1,080,000	1,242,000
Oranges	1928	31,000,000 ^c	102,300,000
	1927	23,000,000 ^c	92,000,000
Grapes	1928	2,331,000 ^c	34,848,000
	1927	2,406,000 ^c	54,336,000
Peaches	1928	25,752,000	12,559,000
	1927	20,500,000	10,675,000
Dry beans	1928	250,000	4,425,000	19,470,000
	1927	296,000	4,825,000	13,028,000

^a tons, ^b bales, ^c boxes.

MINERAL PRODUCTION. Third in rank among the States as a mineral producer in 1926, California maintained in 1927 a high productivity in petroleum, the source of fully half its total value of mineral output. The value of petroleum fell, however, while the output increased, so that the aggregate value of the 1927 petroleum product was less. Petroleum produced was, for 1927, 230,752,000 barrels, and for 1926, 224,673,000; in value, \$280,000,000 (estimated) for 1927 and \$345,547,000 for 1926. The yield of natural gas in 1926, the latest reported year, was 204,915,000 M cubic feet; in 1925, 187,789,000. In value, the yield was, for 1926, \$35,495,000; for 1925, \$32,587,000. From natural gas were made 489,700,000 gallons of gasoline in 1927, as against 389,366,000 in 1926; in value \$44,955,000 for 1927 and for 1926, \$45,945,000. Cement production increased for 1927, to 14,580,654 barrels, from 13,842,483 for 1926. Cement shipments were valued at \$26,623,396 for 1927, or slightly more than for 1926, when they were \$25,299,245. Clay products, only little less valuable in the yearly aggregate than cement, reached a total of \$20,569,492 in 1926, the latest year of record, as against \$21,324,844 in 1925. Production of metals was: gold, 1927, 564,585 fine ounces, 1926, 581,700; in value, 1927, \$11,671,018, 1926, \$12,024,800; silver, 1927, 1,620,240 fine ounces, 1926, 1,977,956; in value, 1927, \$918,677, 1926, \$1,234,244; copper, 1927, 27,133,003 pounds, 1926, 33,466,299; in value, \$3,554,424 (1927) and \$4,685,282 (1926); lead, 2,718,014 pounds (1927), 8,094,000 pounds (1926); in value, \$171,235 (1927), \$647,481 (1926); zinc, 8,062,625 pounds (1927), 20,434,000 (1926); in value,

\$516,008 (1927), \$1,532,542 (1926). Stone production in 1926 was \$10,546,571. Sand and gravel output was somewhat less than this, but important in the aggregate, \$8,820,047. Borates were produced in 1926 to \$2,796,700, and salt and slate each to considerable totals. The total mineral production of the State for 1926 was \$523,352,257; for 1925, \$496,923,376.

For 1928, the production of gold, silver, copper, and lead attained a combined value of \$15,470,000. No zinc mines were operated in 1928. All metals were produced to less value than in 1927. The 1928 gold production, about 524,300 fine ounces, had a value of \$10,838,000; silver production, about 1,504,000 ounces, in value \$880,000; copper about 25,000,000 pounds, in value \$3,650,000; lead about 1,675,000 pounds, in value \$102,000.

FINANCE. State expenditures in the year ended June 30, 1927, as reported by the United States Department of Commerce, were: for maintenance and operation of governmental departments, \$60,409,900 (of which \$22,964,209 was for local education); for public service enterprises, \$2,046,169; for interest on debt, \$4,839,056; for permanent improvements, \$14,235,821; total, \$81,530,946 (of which \$16,087,711 was for highways, \$6,214,284 being for maintenance and \$9,873,427 for construction). Revenues were: \$88,944,960; property and special taxes furnished 20.4 per cent thereof; department earnings and remuneration for State services, 7.1 per cent; license sales and gasoline taxation, 57.1 per cent. No general property tax was levied, other revenue more than covering expenditure. Net State funded debt on June 30, 1927, was \$105,876,476. Of outstanding bonds \$66,500,000 were highway debt.

TRANSPORTATION. The total mileage of railroad line under operation on Jan. 1, 1928, was 8263.96. There were built, in 1928, 12.62 miles of second track and 0.12 mile of third track.

EDUCATION. The four-year training course for elementary public school teachers was adopted, as reported by Superintendent of Public Instruction Cooper in the *Journal* of the National Education Association, and while the requirement was to take effect starting with 1930, it was made effective upon the incoming first-year students of the State teacher colleges. The enrollment of pupils in the public schools of the State in the academic year 1927-28 was: Kindergarten, 76,899; elementary, 675,815; junior high school, 97,760; high school, 436,231; junior college, 7981. Expenditure for public-school education in 1925-26, the latest reported year, was \$145,593,683.19. Salaries of teachers averaged, in 1926-27: kindergarten, \$1734; elementary, \$1739; junior high school, \$2267; high school, \$2377.

CHARITIES AND CORRECTIONS. A State Department of Social Welfare, co-existing with other institutional bodies, was created in 1927, and was intrusted with duties of inspection and related functions, over county jails, six State hospitals, numerous county hospitals, two State prisons, three training schools, and many homes for children, the aged and the disabled. Under the administration of the Department of Institutions were: Agnew's State Hospital, Agnew; Industrial Home for Adult Blind, Oakland; Mendocino State Hospital, Talmage; Napa State Hospital, Imola; Norwalk State Hospital, Norwalk; Patton State Hospital, Patton; Pacific Colony, Padra; Sonoma State Home, Eldridge; Stockton State Hospital,

Stockton; Ventura School for Girls, Ventura; Whittier State School, Whittier; Preston School of Industry, Ione. Under the State Board of Prison Directors were the State prisons at Folsom and at San Quentin. State prisoners on Jan. 1, 1928 numbered 6328; admittances to State prison in 1927, 2050. The prison population formed 1.4 to 1000 of the entire population of the State.

POLITICAL AND OTHER EVENTS. The fiscal system of the State was disturbed in the course of the year by court decisions adverse to the legality of some taxes and by prospects of suits for tax refunds. The State Supreme Court ruled on March 8, that an act of 1925 reducing the assessment on foreign stocks and bonds, for tax purposes, to 7 per cent of market value was unconstitutional. The apprehended effect of this decision was to drive the securities affected out of the State or into hiding, as the alternative to their being subjected to much higher valuations. An amendment of 1927 to the above law, designed to fix the tax on foreign securities at \$1.45 for each \$100 of book value, was also voided by the Court. The State Tax Commission prepared a programme of tax legislation in the course of the year, with a view to the prospect of a special legislative session to deal with the subject. In litigation brought by a Santa Cruz theatre owner, Superior Court Judge Lucas on June 21 ruled that the Cartwright anti-trust law, contested by a group of film producers, was unconstitutional.

The newly created State Park Commission approved in April a plan for increasing by many thousands of acres the system of State parks; the lands needed were to be acquired with funds subscribed in half by voluntary contribution and in half by a bond issue of \$6,000,000, to be approved by a popular vote. Among the areas sought for park land were some of the chief privately owned stands of redwood and of sequoia, and notably the 6120-acre Calaveras Grove, north of the Yosemite National Park. In connection with the park programme, the Governor in April addressed to the Federal Secretary of the Interior a request that some 80,000 acres of Federal land in Southern California, including Red Rock Canyon and the Devil's Garden, be withdrawn from public entry with a view to possible sale to the State. An initiative petition was launched in May to bring to a popular vote in the autumn a proposal to construct at the cost of approximately \$40,000,000 a double twenty-foot highway between San Francisco and Los Angeles. The State Reapportionment act passed in 1927 was kept inoperative by a provision for a referendum on the subject, which had been attached to the measure in passage. Los Angeles interests, opposing the referendum, sought to have it declared void in the courts. The site for a proposed State hospital for drug addicts was selected in March at Pomona.

Difficulties of the Sutter Basin Company, an enterprise largely controlled by the late J. Ogden Armour, having for its object the reclamation of some 55,000 acres of California land, led to the offer of members of the Armour family to redeem \$6,000,000 of special assessment warrants against the land, in the interest of a reorganization.

At a special election in San Francisco on May 1, the proposal to complete the Hetchy

Hetchy water system and to effect a municipal purchase of the Spring Valley distribution system was carried by more than the needed two-thirds majority. The estimated cost to the city was \$65,000,000. The obligations of the city under the Federal Raker Act, granting the city rights in the Hetchy Hetchy Valley and certain other portions of the Yosemite National Park in connection with the water development, were disputed by the city in June, the city objecting to building automobile highways in the water supply area, as likely to lead to the pollution of the watershed by campers. Initial steps were taken in the building of the Civic Opera House designed as the War Memorial of San Francisco.

The water development of Los Angeles suffered a serious reverse in the breaking on March 13 of the municipal water supply dam known as the San Francisquito Dam, on the Santa Clara River. The break released without warning twelve billion gallons of water, which swept down the valley causing the loss of more than 400 lives and damage estimated at \$10,000,000. The city met damage claims by authorizing special issues of bonds for the purpose. An investigating committee appointed by the city council rendered an opinion on April 10 that the collapse of the dam had been caused by its resting on a defective foundation. Work on a flood control dam of the city water system at Big Dalton was halted for a time after the San Francisquito disaster, for further study of the base rock conditions, but was later resumed. The new Los Angeles City Hall was completed in April and dedicated April 24. A white stone structure, it consists of a relatively low building of four stories occupying an entire block, surmounted by a setback superstructure of six stories and a tower of massive proportions, rising some 15 stories above the superstructure, and capped by a stepped pyramid, surmounted by an electric beacon visible for 60 miles, designed as a guide for aviators. A new \$4,000,000 plant of the Pacific Goodrich Rubber Company, for the manufacture of tires, was put into operation at Los Angeles on May 1.

For floods in Sacramento Valley, see **FLOODS.**

ELECTION. The State as a whole was strongly Republican in its vote on the National election of November 6. The vote cast for Hoover and Curtis was approximately twice that for Smith and Robinson. The popular vote for President was reported as: Hoover (Rep.), 1,162,323; Smith (Dem.), 614,356. There was considerable sectional diversity in the vote, however, San Francisco giving a slight plurality for Smith. Hiram W. Johnson was reelected United States Senator for the ensuing regular term. The State's entire delegation in the United States House of Representatives, 10 Republicans and one Democrat, were reelected. There were submitted to the voters a long list of 21 constitutional amendments, initiative measures and bond issue proposals. The most conspicuous of these, a measure to abolish the existing boxing commission and put an end to the permitted ten-round boxing bouts, was heavily defeated. In San Francisco were further submitted 41 local propositions, of which the majority were defeated. Measures to provide a city planning commission and a war memorial were carried by slight margins. The State reapportionment plan rendering repre-

sentation by counties paramount in the State Senate was carried.

OFFICERS. Governor, C. C. Young; Lieutenant-Governor, H. L. Carnahan; Secretary of State, Frank C. Jordan; Treasurer, Charles G. Johnson; Comptroller, Ray L. Riley; Attorney-General, U. S. Webb; Adjutant-General, Richard R. Mittelstaedt; Surveyor-General, W. S. Kingsbury; Superintendent of Public Instruction, William J. Cooper; Librarian, Mabel R. Gillis; Legislative Counsel, Fred B. Wood; President of the Railroad Commission, E. W. Decoto; Chairman of the Industrial Accident Commission, Will J. French; Commissioner of Insurance, Charles R. Detrick; Chairman of the Highway Commission, Ralph W. Bull; Director of the Department of Agriculture, G. H. Hecke.

JUDICIARY. Supreme Court: Chief Justice, William H. Wastie; Associate Justices, William H. Langdon, John W. Preston, Jesse W. Curtis, Emmet Seawell, John E. Richards, John W. Shenk.

CALIFORNIA, UNIVERSITY OF. A coeducational institution of higher learning at Berkeley, Calif., with branches in various parts of the State: University of California at Los Angeles, with the colleges of letters and science, and education; branch of the college of agriculture at Davis; citrus experiment station and graduate school of subtropical horticulture at Riverside; Scripps Institution of Oceanography, La Jolla; Lick Observatory, Mount Hamilton; and agricultural stations at Mountain View, Cortena, and in the Imperial Valley. The number of full-time resident students in courses leading to degrees, on Nov. 1, 1928, was 16,959, of whom 8717 were women and 8242 were men. The university extension division had, in 1927-28, an enrollment of 35,467 in classes and 6692 in correspondence schools. The enrollment in the summer sessions of 1928 was 10,288. At the beginning of the autumn term there were approximately 1500 members on the regular teaching staff and 700 on the extension staffs. The endowment funds for 1927-28 amounted to \$13,280,313, and the income for the year to \$532,251. Gifts for the year approximated \$500,000. The library contained about 1,000,000 volumes. Four buildings on the new campus of the University at Los Angeles were brought near to completion, at a cost of \$3,000,000; and a fifth was to be completed when the institution is moved in the summer of 1929. At Davis an animal science building was completed, the cost being \$300,000; and a new power plant, costing \$40,000, was constructed. On the Berkeley campus, Bowles Hall for men, the first dormitory at the University of California, was completed at a cost of \$350,000. Work was started on the Life Sciences Building, to be the largest used for academic purposes in the United States, and costing more than \$2,000,000. Plans for a new infirmary for students, to cost approximately \$500,000, and for an International House, to cost \$1,750,000, were completed, while an announcement was made of plans for a fine arts group and auditorium, to be the gift of a friend of the University, and to cost more than \$1,000,000. The western entrance of the Berkeley campus, along the main axis, was improved at an expense of \$100,000, and approximately eight acres of land were added to the southwestern portion of the campus for athletic purposes, at a cost of about \$1,500,000. An engineering build-

ing to cost about \$500,000 was planned for 1929. President of the university, William Wallace Campbell, Sc.D., LL.D.

CALMETTE SERUM. See TUBERCULOSIS.

CALVERT, THE REV. DR. JOHN BETTS. American Baptist clergyman, and president of the American Seamen's Friend Society, died at New York, January 12. He was born at Preble, N. Y., Aug. 29, 1852. He was graduated from the University of Rochester, 1876, and from the Union Theological Seminary, 1879. He was principal of the high school, McLean, N. Y., 1871-72, was licensed to preach in 1875, and was ordained in the Baptist ministry, 1880. After several years' service as assistant pastor of the Calvary Baptist Church, New York, he bought *The Baptist Weekly*, changed its name to *The Christian Inquirer* and was one of its editors until its consolidation with *The Examiner* in 1895. He remained as one of the editors of *The Examiner* until 1912. Shurtleff College conferred on him the degree of D.D. in 1894 and Colgate University in 1915. He became a trustee of the American Seamen's Friend Society in 1900, and was president of the society from 1911 until his death. Dr. Calvert wrote: *The Impartial Christ* (1915); *Men Who Have Meant Much to Me* (1918); *Ministering in a Wide Field* (1922).

CAMBODIA. A French protectorate of Indo-China lying to the north of Cochinchina, west of Annam, and south of Laos and Siam. Area, 67,550 square miles; population at the census of 1926, 2,535,178, of whom 1901 were Europeans (excluding the military forces). Pnom-Penh, with a population of 81,712 is the capital, and chief town. The soil is very fertile but only a comparatively small area is under cultivation. The chief product is rice, its annual export amounting to about 250,000 tons. The other products include cotton, pepper, kapok, salt fish, hides, cattle, coffee, sugar, and iron. The imports of 1926 were valued at 68,009,173 francs and the exports at 26,253,000 francs. The budget for 1927 balanced at 10,838,089 piastres. Nominal king, Monivang, who succeeded his father Aug. 9, 1927. Cambodia is one of the five component states of French Indo-China. See FRENCH INDO-CHINA.

CAMEROON or CAMEROONS. See KAME-
RUN.

CAMP FIRE GIRLS. An organization primarily for the adolescent girl. Its purpose is to "seek beauty, give service, pursue knowledge, be trustworthy, hold on to health, glorify work, and be happy." The programme evolved to carry out these aims was planned to take care of the out-of-school time of girls, and practically every wholesome activity which would naturally engage the interest of the young girl is included. These activities are grouped under the seven crafts which form the basis of the system of honor and awards which is used: home craft, health craft, hand craft, camp craft, nature lore, business craft, and patriotism and citizenship. Distributed among these crafts are about seven hundred *honors* which the girls may earn as steps toward the winning of the three progressive ranks. The Camp Fire Honor System, which is based on the theory that if a thing is worth doing it is worth doing with one's whole heart, makes use of symbolism and ceremony and ritual. Each girl upon joining Camp Fire selects a name for herself which expresses some ambi-

tion or ideal. The three ranks of Wood Gatherer, typifying loyalty to organization and group, Fire Maker, the ideal of wider loyalty to Mankind and God, and Torch Bearer, which is the highest rank, the desire to pass on undimmed to others that light which has been given to her, symbolize the taking on of certain responsibilities and carrying out certain desires.

Among the outstanding activities of the year was the making of new clothes and making over of old clothes to replenish the emergency supplies of the Red Cross and the Needlework Guild which had been exhausted due to the many disasters which occurred during the year. The response was universal and resulted in the contribution of thousands of beautifully made garments to the Red Cross and Needlework Guild. The girls also continued the tree planting project begun in 1927, which resulted in the planting of over 200,000 trees. A permanent national

tion are located at 41 Union Square, New York.

CANADA. A dominion of the British Empire in North America, bounded on the north by the Arctic Ocean, on the south by the United States, and on the east and west by the Atlantic and the Pacific oceans, respectively. Capital, Ottawa.

AREA AND POPULATION. The total area is placed at 3,798,123 square miles, of which 3,654,200 is land area and 142,923 water area. It consists of nine provinces, each with its own parliament and administration, and two territories, viz., the Northwest Territories and Yukon Territory, each under a commissioner, assisted by a council. According to the census of 1921, the total population was 8,788,483, as compared with 7,206,643 in 1911.

The accompanying table from the *Canada Year Book* for 1927-28 shows the areas of the provinces, etc., with the population at recent censuses:

Province	Land area sq. miles	Water area sq. miles	Total area sq. miles	Population, 1901	Population, 1911	Population, 1921
Prince Edward Island	2,184	2,184	103,259	93,728	88,615
Nova Scotia	21,068	360	21,428	459,574	492,338	523,837
New Brunswick	27,911	74	27,985	331,120	351,889	387,876

tree planting honor was also adopted. New camps were established in Fargo, N. Dak.; Worcester, Mass.; Oakland, Calif.; Long Beach, Calif.; and Battle Creek, Mich.; while many of those already established were improved with new buildings and additional property. Training courses were held in different parts of the country to meet the growing demand for trained leaders; and the First Camp Fire National Council was held at Denver, Colorado. Miss Florence Hughes was elected president; Jay B. Nash, of New York, first vice president; Dr. Joseph Ray-

The principal cities with their populations in 1921 were: Montreal, 618,506; Toronto, 521,893; Winnipeg, 179,087; Vancouver, 117,217; Hamilton, 114,151; Ottawa, 107,843; Quebec, 95,193; Calgary, 63,305; London, 60,959; Edmonton, 58,821; Halifax, 58,372; St. John, N. B., 47,166; Victoria, 38,727; Windsor, 38,591.

The following table from the *Canada Year Book* for 1927-28 shows the vital statistics of population for recent years (the registration area of Canada excludes Quebec and the Territories):

	Years	Births	Birth rate per 1,000	Marriages	Rate per 1,000	Deaths	Rate per 1,000	Excess of births over deaths	Rate natural increase per 1,000 population
Canada (registration area)	1922	164,194	25.1	47,811	7.3	69,028	10.5	95,166	14.5

Italian	3,466
Swedish	3,321
Jugo-Slav	2,102
Belgian	2,149
Dutch	2,243
Scandinavian-Danish	2,255
Welsh	1,627
Croatian	1,087
Russian	1,296

The occupational classification was given as: Farming, 81,954; labor, 8915; mechanics, 9838; trading, 5358; mining, 1364; female domestics, 13,557; other classes, 23,005. The British Empire Settlement scheme, from its inception to Jan. 31, 1927, cost the Dominion Government \$1,146,887; \$474,000 of this was contributed for passage loans and \$667,000 for passage grants. Other expenses not recoverable account for the remainder.

The population of the Dominion of June 1,

* Where possible the number of schoolhouses is given, and elsewhere the number of school districts with schools in operation.

1927, was officially estimated to have been 9,519,220, an apparent increase of approximately 730,737 over the 1921 census. The only parts of the Dominion for which gains were not calculated was the Province of Prince Edward Island and the Yukon Territory. A 1928 estimate put the population at 9,658,000. According to municipal statistics for 1925, the population of some of the principal Canadian cities in that year was as follows: Montreal, 907,500; Toronto, 556,691 (1926); Winnipeg, 191,356 (1926); Vancouver, 128,350; Quebec, 124,341; Hamilton, 122,238; and Ottawa, 119,254 (1926).

The religious denominations in the order of

their numerical importance in 1921 were: Roman Catholics, Presbyterians, Anglicans, Methodists, Baptists, Lutherans, the Greek Church, Jews, Mennonites, and Congregationalists. Of these 3,389,636 were Roman Catholics, 1,409,407 Presbyterians, 1,407,994 Anglicans, and 1,159,458 Methodists. See CANADA, UNITED CHURCH OF.

EDUCATION. The control of education in the Dominion is directly in the hands of the provinces. The individual articles dealing with the provinces contain the latest available statistics on education for those provinces. Statistics for Canada as a whole are given below.

Higher education in Canada is carried on in 23 universities and 82 colleges, including 21 classical colleges in Quebec. Of the universities six are state controlled (New Brunswick, Toronto, Manitoba, Saskatchewan, Alberta, and British Columbia); four are undenominational (Dalhousie, McGill, Queen's, and Western); while the remainder are denominational. The 23 universities had 4126 professors, etc., and 44,483 students in 1925-26 and the 82 colleges had 20,791 students enrolled in the same year. Some of the better known denominational colleges include: King's, Acadia, and St. Francis Xavier in Nova Scotia; Mt. Allison in New Brunswick; Laval and Bishop's College in Quebec; and McMaster and Ottawa in Ontario.

AGRICULTURE, ETC. In 1926 there were 57,099,000 acres of arable land (about 3 per cent of the land area) and 9,308,000 acres of pasture. The aggregate value of all field crops in 1926 was \$1,104,983,000 and \$1,134,193,000 in 1927, of which the principal crops were wheat, \$439,340,000; oats, \$225,879,000; hay, alfalfa, and clover, \$206,781,000. Including animal products, gross farm income represents an annual value of \$1,750,000,000. The official estimate of Dec. 14, 1928, placed the value of principal field crops for that year at \$1,054,000,000. The accompanying table from the *Commerce Year Book* for 1928 shows statistics of the principal field crops.

CROPS: AREA, PRODUCTION, AND YIELD PER ACRE

Crop	Area (thousands of acres)				Production (thousands of units—bushels, except as indicated)				Yield per acre (bushels)	
	1908-1913	1921-1925	1926	1927	1908-1913	1921-1925	1926	1927	1921-1925	1927

* 1910-1913, * Unit, short ton.

Toward the close of the year, the total wheat crop for 1928 was officially estimated at 500,613,000 bushels (spring wheat, 481,647,000 bushels), with the average yield of 20.8 bushels per acre. The substantial reduction from earlier estimates (550,482,000 bushels) was accounted for by frost and hail damage, which affected both yield and grade, particularly in Saskatchewan and Alberta. Nevertheless, this crop was the largest Canada had ever harvested, and the final return to farmers was expected to equal, if not exceed, that for 1927. An abundance of the lower grades suitable for feed was expected to react favorably on supplies of cattle and hogs. The yield of oats, 437,505,000 bushels, and of barley, 134,452,000 bushels, compare with similar crops in 1927 of 439,712,000 and 90,938,000 bushels respectively. The estimated value of the principal field crops for 1928 was \$1,051,043,000, a decline of 7.3 per cent from 1927.

The *dairying* industry of Canada is carried on most extensively in Ontario and Quebec, although there are dairy factories in all of the provinces. According to the *Canada Year Book* for 1927-28 there were in 1926, 1269 creameries, 1418 cheese factories, 334 combined butter-and-cheese factories, and 26 condensed-milk factories. The total value of all products of dairy factories for 1926 was \$137,379,998 as compared with \$141,406,623 in 1925. The output of Canadian dairies for 1927, according to the Dominion Bureau of Statistics, amounted to \$133,927,256. Creamery butter increased to 178,438,013 pounds valued at \$66,070,160 in 1927, as compared with 177,209,287 pounds worth \$61,753,390 in 1926. Factory cheese output decreased, amounting to 138,026,861 pounds in 1927 valued at \$25,517,355, or 33,704,770 pounds and \$3,290,486 less than in 1926.

The total production of Canadian *maple sugar* for the 1928 season was 13,798,109 pounds worth \$2,269,686, and 1,686,583 gallons of maple sirup valued at \$3,314,902, a total production valued at \$5,584,588. Of this total the Province of Quebec produced 13,090,029 pounds of sugar worth \$2,094,405 and 909,646 gallons of sirup worth \$1,510,012, a total value of \$3,604,417.

Fruit Farming. Many portions of Canada are admirably adapted for this industry, the best known being located in Nova Scotia, New Brunswick, Ontario, and British Columbia. Of orchard fruits apples are most important, and in number of trees and quantity of production greatly exceed all others combined, although peaches, pears, plums, cherries, and small fruits are grown in abundance. Extensive vineyards also exist. According to the *Canada Year Book* for 1927-28 the production of the more important fruits in 1926 with the value was as follows: Apples, 2,984,230 barrels, \$15,776,222; pears, 214,010 bushels, \$567,127; plums and prunes, 319,130 bushels, \$520,182; peaches, 226,465 bushels, \$527,663; cherries, 180,345 bushels, \$557,266; strawberries, 8,618,500 quarts, \$1,809,885; raspberries, 2,722,500 quarts, \$653,400; other berries, 1,925,800 quarts, \$346,644; grapes, 38,400,000 pounds, \$1,920,000.

In 1926 33,356 acres were under *tobacco* (chiefly in Ontario and Quebec), and the production was 28,824,000 pounds valued at \$7,379,000.

The *livestock* census for June, 1927, showed 9,172,000 cattle, 4,695,000 swine, 3,264,000 sheep, 3,422,000 horses, and (1926) 49,641,472 poultry. The total production of eggs for 1926 was 237,-

080,399 dozens, valued at \$66,198,285. The wool-clip for the same year was 17,180,270 pounds, valued at \$3,780,000.

FISHERIES. In addition to an immense salt-water fishing area, Canada has approximately 220,000 square miles of fresh water abundantly stocked with many species of excellent food fishes. The Dominion Bureau of Statistics stated the value of production of the fisheries of Canada for the year 1927 as \$49,460,600. This figure represents the value of the fish marketed, whether sold for consumption fresh, or canned, cured or otherwise prepared. Compared with the year 1926 a decrease of \$6,900,033, or 12 per cent, was shown in the value of the product. The value in 1927, however, was higher than any one of the years 1920 to 1925 and was the fifth highest in the history of the industry, the year 1926 being the third highest.

The four principal kinds of fish, viz., salmon, lobsters, cod, and halibut, all showed decreases, both in quantity caught and in value marketed. The catch in salmon amounted to 1,541,447 cwt., a decrease of 639,023 cwt., or 29 per cent; lobsters 316,831 cwt., a decrease of 22,752 cwt., or 7 per cent; cod, 1,987,803 cwt., a decrease of 755,061 cwt., or 28 per cent; and halibut, 329,032 cwt., a decrease of 10,886 cwt., or 3 per cent. The total marketed value of these four kinds of fish was \$29,656,013, a decrease of \$7,765,496. Herring is fifth on the list of principal kinds of fish and showed an increase in catch and in marketed value. The principal items of prepared fish are canned salmon with a total pack in 1927 of 1,363,235 cases, a decrease of 703,583 cases; canned lobsters, 113,937 cases, a decrease of 9582 cases; canned sardines, 240,091 cases, an increase of 22,499 cases; dried cod, 447,656 cwt., a decrease of 179,241 cwt; and dry-salted herring, 1,048,615 cwt., an increase of 109,968 cwt.

The value of the vessels, boats, gear, etc., used in the primary operations of catching and landing the fish in 1927 was \$26,783,340, an increase over the preceding year of \$2,760,966, or 11 per cent. The number of men employed in the primary operations was 63,303 compared with 61,371 in 1926. The number of fish-canning and curing establishments in operation in 1927 was 776, with a total capital investment of \$24,364,385, compared with 831 establishments and a capital of \$28,868,071 in 1926. The number of lobster canneries was 438, a decrease of 17; the number of salmon canneries, 81, an increase of two; of sardine and other fish canneries, six, an increase of four; of fish-curing establishments, 203, a decrease of 48; and of reduction plants, 33, an increase of 10. The number of persons employed in the establishments was 16,817, compared with 17,408 in 1926.

FORESTS. It has been officially estimated that the total area of land covered by forests is 1,227,000 square miles. Less than 40 per cent of this area, however, is covered with commercial timber. The most important timber areas are in Northern Ontario, Quebec, and British Columbia. In 1926-27 the value of manufactured wood and paper exports was \$175,237,502. The greater part of the export went to the United States, which took more than 86 per cent of the exportable surplus in 1926-27. The Crown forests belong to the provincial governments, except in Manitoba, Alberta, and Saskatchewan, and the railway belt (40 miles wide) in British Columbia, where they belong to the Dominion.

FUR INDUSTRY. Canada ranks third as a raw fur producing country, being exceeded only by the United States and Russia. The value of production during 1926-27, the last year for which figures were available, was \$18,833,977, which represented the highest valuation since the post-war period of expansion. The comparable figures for preceding years were: 1925-26, \$15,072,244; 1924-25, \$15,441,564; and 1923-24, \$15,643,817. The increased value of the 1926-27 production was attributable primarily to the higher prices paid for the principal Canadian skins. Although there were decreases in the number of the principal kinds of pelts taken, the total of all kinds increased from 3,686,148 to 4,289,233, attributable to a very large extent to a gain of 807,283 in the number of rabbit skins produced. This pelt, however, is one of the least valuable and the total value of annual production amounted to only \$123,753.

It has always been the practice of the trappers to keep foxes caught in the warm weather, alive, when possible, until the winter season, for then the fur is prime and consequently much more valuable. From this custom has arisen the modern industry of fur farming. Several other ani-

MINERAL PRODUCTION. A new high record for mineral production in Canada was set in 1927, when the value of the output reached \$244,520,098, marking a gain of \$4,090,000 or 1.7 per cent over the previous year's record total of \$240,437,123. New output records for all time were established in gold, copper, lead, and zinc among the metals, and in coal, cement, lime, and gypsum in the non-metal and structural materials field. Value for natural gas and petroleum production also exceeded any recorded in previous years. Increased outputs, in comparison with the totals for 1926, were noted in the figures for arsenic, cobalt, copper, gold, lead, nickel, platinum metals, zinc, coal, natural gas, petroleum, gypsum, pyrites, clay products, cement, limestone, and gravel.

The following table supplied by the Dominion Bureau of Statistics shows the values of production for metals, fuels, and non-metals, clay products and other structural materials for the years 1907, 1912, 1917, and 1922 to 1927 inclusive.

The preliminary figures covering the mineral production of Canada for 1928 indicated that

VALUES OF MINERAL PRODUCTION OF CANADA BY CLASSES, 1907, 1912, 1917, AND 1922-1927

Year	Metallic	Non-Metallic Fuels and other non- metallics	Structural materials and clay products	Total
1907	\$42,426,607	\$31,275,546	\$12,863,049	\$86,865,202 *
1912	61,172,753	45,080,674	28,794,869	135,048,296
1917	106,455,147	63,354,363	19,837,311	189,646,821
1922	61,785,707	82,976,794	39,534,741	184,297,242
1923	84,391,218	91,936,732	37,751,381	214,079,331

1926	115,237,581	85,240,144	39,959,398	240,437,123
1927	113,135,582	88,498,024	42,886,492	244,520,098

* Total includes \$300,000 allowed for products not reported.

mals are being raised in captivity, notably the mink, raccoon, skunk, marten, fisher, beaver, and muskrat, but more important than all of the rest combined is the silver fox. Fox farming was carried on in all the provinces of the Dominion, and the latest figures available, for 1926, showed 2523 fox farms in Canada with a total of 51,612 animals, 47,657 being silver foxes.

Before the World War London was the principal market for Canadian furs. In the post-war years, however, the United States had supplanted the mother country in this trade and now takes the major portion of the pelts exported from Canada. During the year ended March, 1928, of a total of \$24,315,244, shipments to the United States were valued at \$14,335,751, and to the United Kingdom, \$9,185,200. Negligible quantities went to other countries.

that year would establish a new high record in output, both in volume and in value. The Dominion Bureau of Statistics estimated such production at \$271,000,000, an increase of 10 per cent over 1927 and for a third successive year establishing a high record. Nickel amounted to 93,789,000 pounds as against 66,799,000 pounds in 1927 and copper was 191,944,000 pounds, as compared with 140,147,000 pounds in 1927.

MANUFACTURES. The value of Canadian manufactures increased markedly since 1921. The ten leading manufacturing industries are pulp and paper, flour and grist-mill products, slaughtering and meat packing, saw mills, butter and cheese, automobiles, electric light and power, rubber goods, cotton yarn and cloth, and sugar refineries.

SUMMARY OF STATISTICS OF MANUFACTURES

Year	Estab- lish- ments	All em- ployees	Wage- earners	Value of products, thousands of Canadian dollars	Value added by manufac- ture, thou- sands of Canadian dollars	Primary horse power, thousand
1910 *	19,218	515,203	1,165,976	564,467
1917	22,838	621,694	552,968	2,873,268	1,332,181	2,889
1920	23,351	609,586	526,571	3,772,250	1,686,978	3,576
1922	22,541	474,430	398,390	2,482,209	1,198,434	3,612
1923	22,642	525,267	446,994	2,781,166	1,311,025	3,762
1924	22,178	508,503	432,273	2,695,054	1,256,644	4,300
1925	22,381	544,225	466,602	2,948,545	1,360,880	5,083
1926	22,708	581,527	499,703	3,247,803	1,519,279

* Establishments with 5 hands and over; all establishments for other years shown.

According to an estimate prepared by *The Financial Post*, of Toronto, Canadian revenue from productive industries in 1928 attained the record total of \$6,840,278,995, representing an increase of about 8 per cent over the previous year. Agriculture, forestry, fishing, trapping, mining, electric power, construction, and manufactures all brought additional revenues to Canadian producers, although crop income was lower. On the basis of these factors alone the per capita income of British Columbia amounted to \$926; Ontario, \$908; Alberta, \$732; Saskatchewan, \$641; Manitoba, \$553; New Brunswick, \$438; Nova Scotia, \$372; and Prince Edward Island, \$344. Alberta was the only province to show a decline from the previous year, because of poor wheat yield. These figures indicated that the western provinces provided the best markets. Expansion of manufacturing in Ontario was calling forth prosperity in that province, although in Quebec the newsprint situation was an adverse factor.

With additions of 222,000 horse power in 1927 the total of Canadian hydroelectric installations amounted at the end of 1927 to 4,778,000 horse power or nearly double the total at the end of 1920. The outstanding developments of the year included the completion of a high-voltage transmission line from Isle Maligne to the city of Quebec, 135 miles, and progress on the construction of the Ontario Hydroelectric Power Commission's line from the Gatineau River in Quebec to Toronto, 200 miles. Among all countries Canada ranked next to the United States in the amount of developed water power, and the hydroelectric current generated was greater per capita than in the United States. The potential capacity of water powers at ordinary minimum flow was estimated at 18,255,000 horse power. The capacity of installed water turbines in 1926 was 4,556,000 horse power as compared with 975,000 in 1910 and 2,508,000 in 1920. Considerable quantities of electric current were exported from Canada to the United States, the amount in 1926 being 1,359,000,000 kilowatt-hours. A large proportion of factory machinery is operated by electricity. The factories, apart from central electric stations, had in 1924 prime movers of 1,282,000 horse power.

Bank clearings during 1928, particularly the gain in the western cities reflected general prosperity on the Dominion as well as operations upon the stock exchanges. Statistics of bank clearings in six important Canadian cities for the years 1927 and 1928 were:

City	1927	1928	Per cent Increase
Halifax ...	\$ 160,582,910	\$ 185,678,418	16
Montreal ...	6,771,872,658	8,072,843,473	19
Toronto	6,484,985,731	7,674,864,018	18
Winnipeg ...	2,794,528,268	3,443,151,986	23
Calgary	436,380,849	666,517,874	53
Vancouver ..	924,784,859	1,109,375,640	20

COMMERCE. According to the condensed preliminary report of the trade of Canada for 1928, compiled by the Minister of Trade and Commerce, the total trade of Canada for the fiscal year ended Mar. 31, 1928, was valued at \$2,359,412,000, compared with \$2,298,466,000 in 1927, and \$2,256,029,000 in 1926; the increase over 1927 amounting to \$60,946,000 or 2.2 per cent, and over 1926 to \$103,383,000 or 4.6 per cent. Imports in 1928 show a decided improve-

ment over 1927 and 1926, while exports show a decline. Imports in 1928 amounted to \$1,108,956,000, compared with an importation in 1927 valued at \$1,030,893,000, and in 1926 at \$927,329,000; the increase in the imports over 1927 amounting to \$78,063,000 or 7.3 per cent, and over 1926 to \$181,627,000 or 19.6 per cent. Export trade (domestic and foreign combined) was valued at \$1,256,456,000 in 1928, at \$1,267,573,000 in 1927, and \$1,328,700,000 in 1926; the decrease in 1928 compared with 1927 amounting to \$17,117,000 or 1.4 per cent, and compared with 1926 to \$78,244,000 or 5.9 per cent. The domestic exports of Canada in 1928 totaled \$1,228,208,000, in 1927, \$1,252,158,000, and in 1926, \$1,315,356,000; the decrease in 1928 compared with 1927 amounting to \$23,950,000 or 1.9 per cent, with 1926 to \$87,148,000 or 6.7 per cent. For the calendar year 1928 imports were valued at \$1,220,317,000 and exports at \$1,349,751,000. The imports from the United States totaled \$825,740,612 an increase of 16.8 per cent over 1927.

TRADE WITH THE UNITED STATES. Canada's total trade with the United States during the year ended Mar. 31, 1928, was valued at \$1,216,090,000, compared with a similar trade in 1927 valued at \$1,166,357,000, and in 1926 at \$1,094,570,000; the increase over 1927 being \$49,733,000 or 4.4 per cent, and over 1926, \$121,520,000 or 11.1 per cent. In 1928 Canada's imports from the United States were valued at \$719,443,000, in 1927 at \$687,022,000, and in 1926 at \$608,618,000; the increase in 1928 compared with 1927 amounting to \$32,421,000 or 4.7 per cent, and with 1926 to \$110,825,000 or 18.2 per cent; whereas the total exports to the United States amounted to \$496,647,000 in 1928, to \$479,335,000 in 1927, and to \$485,952,000 in 1926; the increase of 1928 over 1927 being \$17,312,000 or 3.6 per cent, and over 1926, \$10,695,000 or 2.2 per cent. The exports of Canadian produce to the United States in 1928 totaled \$478,006,000, in 1927, \$466,422,000, and in 1926, \$474,987,000; the increase in 1928 compared with 1927 amounting to \$11,584,000 or 2.5 per cent, and with 1926 to \$3,019,000 or 0.7 per cent.

FINANCE. The budget proposals for the fiscal year ending Mar. 31, 1929, as presented to Parliament on February 16, by the Finance Minister, included reduction of the income tax payable by corporations to 8 per cent, a reduction in the sales tax from 4 to 3 per cent, and important revisions in the tariff schedules, mostly downward. It also proposed to reduce the income tax payable by individuals by 10 per cent and to increase the personal exemption of individuals with dependents. The total revenue for the fiscal year 1928-29 was estimated at \$419,480,000; estimated expenditures were \$364,665,000.

Although the figures for the 1927-28 budget on page 133 are estimates, the actual totals for that year did not show much variation. The total receipts were \$429,701,000 and the total ordinary expenditures, \$336,168,000.

Collections of customs duties and excise taxes of the Department of National Revenue amounted to \$340,750,625 during 1928 as compared with \$319,288,477 during the previous year. This represents an increase of about 7 per cent.

minion as of Aug. 31, 1928, gave the funded debt as \$2,395,664,000, as compared with \$2,480,752,000 on Aug. 31, 1927—a reduction of more than \$85,000,000. The total liabilities of the Dominion were \$2,740,656,000, a decrease of more than \$41,000,000. The total net debt was \$2,229,574,400 a decrease of \$6,107,000 from July 31 and a decrease of \$54,471,000 from Aug. 31, 1927. The total amount of notes of the Federal Government and chartered banks in circulation August 31 was \$196,838,205; provincial notes aggregated \$27,623. The Minister of Finance held \$76,898,498 in gold on that date against the notes in circulation and \$2,999,082 against savings banks deposits.

SHIPPING. The merchant marine on June 30, 1927, consisted of 896 vessels of 1,255,231 gross tons. The number of vessels entered in the foreign trade for the fiscal year ended Mar. 31, 1927, was 21,382 of 23,224,000 tons (with cargo); cleared, 20,923 vessels of 22,925 tons (also with cargo). The statistics for coastwise trade, including rivers and lakes, showed arrivals of 92,222 vessels of 43,125,000 tons and departures of 90,814 vessels of 42,617,000 tons.

RAILWAYS. About one-half of the railway mileage of Canada is operated by the Government as the Canadian National Railways System. In 1926 this system operated 22,681 miles of line, carried 22,240,000 passengers and 74,156,000 short tons of freight, and had gross receipts of \$275,570,000. The principal private railway is the Canadian Pacific, which in 1926 operated 14,894 miles of line, carried 13,560,000 passengers and 33,593,000 short tons of freight, and had gross receipts of \$198,026,000. The accompanying table covers data for all steam railways.

The year 1928 was marked by the exceedingly rapid construction of the new Hudson Bay Railroad and its connecting line to the Flin Flon mine. On the Hudson Bay Railway steel was being laid at a rate of about one mile a day. The engineers intended to continue the work

throughout the entire winter, whenever feasible, and confidently expected to have the road completed to within 20 miles of the Fort Churchill terminal by April, 1929. (See preceding YEAR BOOK.) Although extensive grading work was necessary over the last 20 miles it was expected that trains would be running to Fort

Churchill by August, 1929. The Manitoba & Northern Railway, extending from the Hudson Bay road to the Flin Flon mine, a distance of about 90 miles, was completed on September 22, three months before the time specified in the contract. The contractors were paid a bonus of a quarter of a million dollars for this extremely rapid work. Early completion was stressed because of the necessity of transporting 25,000 tons of material for the construction of a power plant at Island Falls from Flin Flon to the site of the plant by a winter road 65 miles in length. The initial development at the new plant will be about 36,000 horse power and it will cost \$7,000,000.

NEW RAILWAY CONSTRUCTION—1928

Nova Scotia	0.27 ^a
Quebec	1.30
Ontario	15.00

Saskatchewan	333.30
Alberta	226.90
Total, Canada	722.87

^a Second track.

The construction of new railway lines in Canada according to the *Railway Age* (New York) showed a marked increase in 1928 over 1927, amounting to 723 miles, as compared with 310 miles in the preceding year, an increase of 413 miles, or 133 per cent. This increase was greater than that for any year since the outbreak of the World War stopped all construction activities in 1914. Of the 1928 total, the Canadian National built 291 miles and the Canadian Pacific 378 miles, principally in the Western provinces. The Hudson Bay Railway was extended 59 miles, and the branch to the Flin Flon mining district from a connection with the Hudson Bay near the Pas, Man., 87 miles, was completed.

Total carloadings for the year 1928 were 2,053,095, or 9 per cent higher than 1927. The 1928 figures established a record.

On Mar. 31, 1926 there were 378,269 miles of highway of which 323,629 miles were earth and 47,177 were gravel, and the remainder concrete and macadam. The number of motor vehicles in 1927 was 950,000, of which 841,000 were passenger cars and 109,000 were trucks and busses. Tourist traffic was estimated to have increased 50 per cent during 1927 and in all probability added in excess of \$200,000,000 to Canadian income. An official estimate of tourist traffic compiled in 1927 by the Dominion Bureau of Statistics credits the United States with all but \$5,000,000 of the total 1926 tourist expenditure of \$190,000,000. This was approximately twice the expenditure in 1920. In 1927 there were 12,440 post offices; in 1926, 52,961 miles of telegraph line and 3,306,214 miles of telephone wire, and 1,201,008 instruments in use.

GOVERNMENT. Executive power is exercised in the King's name by the Governor-General of Canada, acting through a responsible ministry or cabinet. Legislative power is in a Parliament of two houses: a Senate and a House of Commons, the former consisting of 96 members appointed for life and the latter of 245 members in accordance with the distribution act of 1924, elected for five years (unless sooner dissolved) by popular vote, including woman suffrage. Women are eligible for election to Parliament. The Governor-General in 1928 was Viscount Willingdon. As a result of the election of Sept. 14, 1926, the House of Commons was composed of the following parties: Liberals, 118; Conservatives, 91; Liberal-Progressives, 11; United Farmers of Alberta, 11; Progressives, 9; Labor, 3; and Independent, 2. The cabinet as formed on Sept. 25, 1926, is as follows: Prime Minister, Secretary of State for External Affairs, William Lyon Mackenzie King; Finance and Receiver General, James A. Robb; National Defense, Col. J. L. Ralston; Postmaster General, Peter J. Veniot; Soldiers' Civil Reestablishment and Public Health, James H. King; Justice and Attorney-General, Ernest Lapointe; National Revenue, W. D. Euler; Marine and Fisheries, Pierre J. A. Cardin; Secretary of State, Fernand Rinfret; Railways and Canals, Charles A. Dunning; Interior, Indian Affairs, and Mines, Charles Stewart; Agriculture, William R. Motherwell; Public Works, John C. Elliott; Trade and Commerce, James Malcolm; Solicitor General, Lucien Cannon; Immigration and Colonization, Robert Forke; Labor, Peter Heenan; Minister without Portfolio, Senator Raoul Dandurand.

HISTORY. The meeting of the Canadian Parliament in the spring spent considerable time discussing the budget (see above under *Finance*) and the status of the Dominion under the results of the Imperial Conference of 1926. (See *YEAR BOOK* for that year.) It became increasingly plain that both parties in Canada expected the Government to assert its independence and freedom from any kind of control at London to a greater degree as time went on. Along these lines may be mentioned the appointment of Dominion diplomatic agents to Japan and Paris. These representatives were virtually full-fledged ambassadors and were capable of carrying on negotiations with these countries to the same extent that the representative in Washington does for the Dominion Government. It was also proposed during the year to have a diplomatic representative of Great Britain appointed to

serve at Ottawa, inasmuch as the Governor-General of Canada was merely the personal representative of the British King.

One of the problems that the new representative in Japan would have to deal with almost immediately was the question of Oriental immigration on the west coast, particularly in British Columbia. This province was passing through all the stages that have fallen to the lot of the Californians in recent years. The Japanese and Chinese laborers with their lower standards of living were flocking to the Canadian shores and seriously interrupting the economic progress of the Canadian people. British Columbia was helpless to deal with the matter, inasmuch as they had no direct share in foreign affairs and the question of immigration was subject to treaty relations. The province demanded that immigration be reduced to the lowest possible point and that those immigrants of the Far East who were already in British Columbia should be sent back. British Columbia was also desirous of passing alien land laws and education laws similar to those which caused so much friction between Japan and the United States a few years ago. Japan, of course, stood on her treaty rights and stated again and again that she had nothing to do with British Columbia but could only deal with Canada as a unit.

Relations between the United States and Canada remained very cordial during the year. The Royal Commission on Customs and Excise brought in its report in the early part of the year and stated that there was a tremendous amount of illegal smuggling going on between Canada and the United States, particularly in liquor. The Commission made several recommendations to stop this practice, among which might be mentioned the abolition of the right of private firms to ship liquor, the reduction of the penalty for smuggling in order to get more convictions, the increase of the number and standards of the border patrol, and the seizure of vessels believed to be engaged in this trade. It was planned to hold a joint conference on the subject early in 1929.

CANADA, THE UNITED CHURCH OF. Under this designation a single body was formed in 1925 by the union of the Congregational Churches, the Methodist Church, and the Presbyterian Church in Canada. The Methodist Churches of Newfoundland and Bermuda are also included in the union. Following upon the formal consummation of the union, June 10, 1925, a total of 400 congregations, mostly in smaller towns and rural districts, amalgamated into approximately one-half that number of self-supporting charges, the number of these local consolidations within the Conferences being as follows: British Columbia, 45; Alberta, 23; Saskatchewan, 38; Manitoba, 22; London, 36; Hamilton, 30; Toronto, 60; Bay of Quinte, 24; Montreal and Ottawa, 45; Maritime Conference, 87; Newfoundland, none. After union came into effect, 285 new fields of home-mission status were opened under the Board of Home Missions, each of these 285 fields including between three and four places at which public worship was inaugurated and regularly conducted. It followed that nearly 1000 communities were served in 1928, in areas previously unoccupied by any Church. In the same period 375 fields which were formerly aid-receiving became self-support-

ing and passed off the home-mission list. There were 1571 fields on the home-mission list at the end of the year, and 4368 preaching places in these pastoral charges.

At three successive General Councils, held in 1925, 1926, and 1928, the permanent organization of the Church went forward. The third General Council, held at Winnipeg, Manitoba, in September, 1928, took action looking to a strong evangelistic movement in the period leading up to the nineteenth centenary of Pentecost in 1930. It was decided to hold the fourth General Council in London, Ont., in 1930. General statistics for the year ending Dec. 31, 1927, showed the following returns: Conferences, 11; Presbyteries, 115; communicants, 637,750, an increase of 37,228 since Mar. 31, 1926; number of families under pastoral care, 395,724; number of persons under pastoral care, 1,418,351; members of Sunday schools, 619,570, about 300 new Sunday schools having been formed during the year 1927. The Moderator of the General Council for 1928-30, was the Right Rev. William T. Gunn, D.M.A., D.D., and the secretary, the Rev. T. Albert Moore, D.D., 421 Wesley Buildings, Toronto 2, Ont.

CANALS. While ship canals show their great economic value, and the completion of the Welland Ship Canal in Canada, under construction in 1928, was awaited with great interest, the inland canal system in America appears, in spite of recent agitation for increased expenditure, to have reached its culmination many years ago. By 1928 over three quarters of the American inland canal system had been abandoned and the only great recent experiment, the New York State Barge Canal, continued to be a seven-million-dollar annual burden to the taxpayers of this State and carried less than 10 per cent of the designed traffic. In Europe conditions as regards speed in transportation and low labor costs for loading, unloading, and transshipping, still encouraged canal construction.

INLAND ATLANTIC WATERWAY. During the year some work was done on this system which ultimately would make it possible for small vessels to go from Boston to Virginia by an inland route.

THE CAPE COD CANAL. Built by private interests in 1914, and connecting Buzzards and Massachusetts bays, this canal was purchased by the Government during the year for about \$12,000,000 and was to become a toll-free part of the Atlantic inland waterway. Another link was the *Chesapeake and Delaware Canal*, a historic work, taken over by the Government in 1919.

OHIO RIVER CANALIZATION. The United States Government engineers continued the works for the improvement of the Ohio destined to provide a 9-foot depth for its entire length of 968 miles. Two fixed, and forty-eight movable, dams were required and locks generally 110 x 600 feet in size were being built. From the technical viewpoint it is an interesting piece of work, but it remained to be seen whether an expenditure of over 100 million dollars for this purpose would be justified by the traffic developed.

GERMAN CANALS. Details are lacking, but it was reported that three important works were under way in Germany. Indeed the Rhine-Danube Canal was practically finished and had been opened in large part to traffic for some time. The so-called Midland Canal joining the Rhenanian-Westfalian industrial district with central

Germany was expected to be completely in service by 1930. The Hanskanal from the Rhur to Hamburg, on the other hand, while under construction, would take some eight years to complete.

THE MURRAY RIVER WORKS, AUSTRALIA. Rapid progress was being made on these great navigation and irrigation works in the southeast corner of Australia. The Murray River, with its principal branch, the Darling, empties into the sea near Adelaide in South Australia, and this State had long been interested in improving it for navigation. On the other hand, New South Wales and Victoria, in whose territory it rises, were interested primarily in irrigation development. South Australia began works in 1911, after ineffective attempts to secure coöperation with its sister States. The Act of 1915, however, brought about an effective scheme for concerted action between the Commonwealth of Australia and the three States and work since had gone forward on a project which had been changed more or less from time to time but which involved an expenditure of some 35 or 40 million dollars. The most important works were the two dams forming storage reservoirs at Lake Victoria on the lower and at Mitta Mitta on the upper Murray, a stream which is in some years navigable at all times for as much as 1100 miles from its mouth while in other years it dries up in part and may be navigable for only one month.

The scheme involves some 900 miles of the Murray, the costs being met in part by the Commonwealth and by the construction of separate works by the State most vitally interested. The lowest lock and weir at Blanchetown were put in service in 1922, no regulating works being required in the 170 miles below this point. Between Blanchetown and Lake Victoria six other similar works were necessary which would also facilitate the irrigation of several thousand acres. Several other weirs and locks follow, and in the Kerang district, north of Melbourne, where some 85,000 acres of land have been under irrigation by the use of two depressions, Kerang Lake and Kow swamp, flow is insured by means of the Torrumbarry Weir and Lock completed in 1923. The greatest single work is the Mitta Mitta Dam at the junction of this river with the Murray. This dam, an earth structure with concrete core wall and a concrete sluice and spillway and of a total length of 5300 feet, will submerge some 69 square miles and will store two million acre feet of water. It was under construction in 1928.

WELLAND CANAL. Probably the most important canal work in the new world in progress and nearing completion in 1928, was the Welland Ship Canal which would join lakes Erie and Ontario. Although this work was started in 1913, construction was held up due to the World War, but was resumed later and the contract for the last section was let in 1925. It was expected that the work would be completed in 1930. Seven locks, among the largest in the world, were to replace the numerous small locks of the existing canal. An unfortunate accident in August, 1928, wrecked one of the huge canal gates—a mitering leaf 82½ feet high was overturned by a falling crane—but the Canadian Government was carrying the work forward as rapidly as possible.

This canal was designed to permit lake ship-

ping to reach ports on Lake Ontario and doubtless would have an important effect on traffic routes between the Great Lakes and the Atlantic Seaboard. There are, of course, two possibilities. Either the St. Lawrence or the Great Lakes-Hudson ship canal may be built, or ports may be established on Lake Ontario, superseding to a considerable extent the Lake Erie ports, for transshipment from lake steamers to railroads. The St. Lawrence project was still tied up in international complications and the Great Lakes-Hudson Canal, because of physical and operating difficulties as well as the New York Barge Canal failure, also seemed rather remote. The Canadian Government had, therefore, already selected Prescott, Ontario, a town well along the St. Lawrence below the eastern end of Lake Ontario, as a site for a new port. On the American side no official action was, of course, possible, but Oswego would naturally hope to profit by such extension of the Great Lakes steamship lines into Lake Ontario as may occur.

CHICAGO DRAINAGE AND ILLINOIS CANALS. Although the Chicago Drainage Canal was built primarily to enable Chicago to discharge her drainage into the upper Mississippi Valley instead of Lake Michigan, her source of water supply, it will become in the near future a connecting link in a waterway from the Great Lakes to the Mississippi. This will be made possible through the construction of a connecting Illinois waterway, 63 miles long from the Drainage Canal at Lockport to the Illinois River at Starved Rock. It was expected that the work would be completed by 1930. The canal was to be 200 feet wide with 9 feet depth of water and will require five locks 110 x 600 feet. Provision also was made by Congress for a 9-foot depth in the Illinois River from Starved Rock to the Mississippi.

In the meantime the whole Chicago Drainage and water supply problem was under discussion. Inasmuch as the apportionment of Great Lakes water between the United States and Canada at Niagara Falls—36,000 sec. ft. (cubic feet per second) to Canada and 20,000 sec. ft. to United States—was assumed to have been based on an allowance for the Chicago and other American diversions including the New York Barge Canal, and because of its effect on navigation in the Great Lakes, the diversion by Chicago was vigorously attacked by other States and became a major economic and water-rights problem. New York was interested in the hope of increased power opportunities at Niagara. The Great Lakes cities also were interested due to the lowering of the lake level and because of the precedent set by the Chicago diversion. A report by a board of review, consisting of over 25 well-known engineers, in 1925, while apparently intended to set the seal of engineering approval on the Chicago diversion, was generally accepted as being merely a technical statement of Chicago's interests in the matter. In the same year the United States War Department increased the allowance for diversion from 4167 sec. ft. which had been authorized at the opening of the Chicago Drainage Canal in 1900, to 8500 sec. ft. not inclusive of the diversion for water supply, which averaged 1200 to 1500 sec. ft., making a total of about 10,000 sec. ft. The permit was for five years and set forth certain conditions to be observed, one of which relating to the reduction of waste through metering has certainly not been met.

Following the granting of this permit, action was brought before the Supreme Court by thirteen States affected by the diversion and questioning the legal rights of Chicago therein. Charles E. Hughes was appointed special master to report on the subject which he did late in 1927, but no action has been taken by the Supreme Court, up to the end of 1928. Briefly, Judge Hughes recommended that the complaint of the thirteen States be dismissed and stated that in his opinion the War Department had authority under Congress to grant such permits, to impose reasonable conditions and to judge whether they had been complied with. If this was accepted by the Supreme Court, the case doubtless would go to Congress. The proposed Delaware development for New York's water supply, involving an interstate source, was also being held up pending the outcome of the Chicago controversy. See *Journal American Water Works Association*, vol. xix (1928).

See also PANAMA CANAL; SAULT STE. MARIE, CANALS AT; SUZ CANAL.

CANARY ISLANDS. A group of small islands off the northwest coast of Africa, belonging to Spain. Area, 2810 square miles; population, Jan. 1, 1927, estimated at 503,151. The capital is Santa Cruz de Teneriffe, with an estimated population in 1927 of 52,757. The next largest city is Las Palmas, with a population of 67,122 in 1920. The University of Seville maintains an educational establishment in the Canaries and is in charge of higher education. There is regular steamship communication with Spain. The islands are under the administration of continental Spain through a local governor.

CANBERRA. The new Federal capital of Australia. (See AUSTRALIA.)

CANCER. ECONOMIC LOSS THROUGH CANCER. According to statistics compiled by Dr. Dublin of the Metropolitan Life Insurance Co., cancer costs on an average \$1000 for medicine and nursing alone. If we multiply this figure by 110,000, the number of cancer deaths in the United States yields an annual cancer bill of \$110,000,000. But if the economic value of the victims is computed on a basis of earning capacity, which of course varies with the various age groups, the cancer losses amount to more than \$580,000,000 annually which when added to the cost of the disease brings the total up to \$800,000,000. If this great loss were due to the forces of nature, as shown in inundations, hurricanes, earthquakes, etc., expert engineers would be asked to concentrate all of their energies on the problem. But if human life alone is at stake without any property considerations there is much less of care and anxiety. If all of the potentially valid agencies could be mobilized and coordinated, there might be some hope of bringing cancer under control, as has happened in the case of other social maladies.

IS CANCER A DISEASE OF THE ELDERLY? Blumenthal, the director of the Berlin Institute for Cancer Research, asks this question in the *Archiv f. Verdauungskrankheiten*, vol. 43, p. 82. Cancer is regarded as a disease of metabolism and all metabolic affections are most prevalent in middle and advanced years. After 70 there is no further tendency to increase, but in many statistics to decrease; which is readily explained by the general increase of the death rate. With increasing years there is a decline in the resistance to all disease, so that where there has

been a cancer menace in the shape of local irritation and disease, this menace is increased. Nevertheless it is not strictly correct to state that old age per se is a predisposition. We know further that a long period of incubation often amounting to many years lies between the first application of the causes and the final results. This incubation period undoubtedly varies with the kind of cancer, the locality and the exciting cause, but the reason why most young folk escape cancer may be linked up with the extremely long incubation period.

ALKALINE THEORY OF CANCER. While the condition known as acidosis is responsible for much disease, it seems favorable to a few ailments, as epilepsy and cancer. It appears that, in an address by Dr. E. McDonald, of the University of Pennsylvania Cancer Institute, delivered before the American Chemical Society Institute, the speaker accused alkalinity as the decisive factor in causing cancer. Whatever facilitates lowered acidity acts as a contributory cause and whatever raises it should act beneficially. Subjects with acidosis he found were immune. Irradiation acts favorably because it reduces alkalinity. The author was by no means the first to bring out this theory for the entire trend of modern chemical research has long pointed in this direction. Practical application of this principle will not be a simple matter for if inorganic acids would arrest the growth of cancer so simple a matter would have come to light long ago. It will be necessary to go deeper and find out the causes of the increased alkalinity and how to promote acidity. Diet may play a rôle here and certain drugs like calcium salts can be used to keep down alkalinity. But there may be an effort on the part of the tissues themselves to fight acidosis, which well appears from the fact that mineral acidosis produced by ammonium chloride has arrested cancer growth for a short time, but the system soon developed tolerance to the drug.

CANE SUGAR. See **SUGAR**.

CAPE COLONY. See **CAPE OF GOOD HOPE PROVINCE**.

CAPE OF GOOD HOPE PROVINCE. One of the four original provinces of the Union of South Africa; the southernmost province of the Union; formerly known as Cape Colony or the Colony of the Cape of Good Hope. Area, 276,536 square miles; population at the census of 1921, 2,781,542, of whom only 650,327 were European. The population at the census of 1911 was 2,564,965. The chief towns with their white population in 1921 were: Cape Town, 113,302; Kimberley, 18,288; Port Elizabeth, 25,982; East London, 20,374. The movement of population in 1926 so far as registered, was: Births, 57,468; deaths, 33,167; marriages, 15,026. In 1927 there were 112 local school districts. In 1926 there were 4585 aided schools with 137,843 European pupils, 176,955 non-European pupils, and 11,236 teachers. The trade between the province and the United Kingdom in 1927 was: Imports into the United Kingdom from the province, £15,082,404; exports from the United Kingdom into the province, £14,239,807. The chief exports to the United Kingdom were wool, mohair, hides and skins, corn, and feathers; the chief imports from the United Kingdom were cotton and woollen goods, machinery, iron and steel goods, and paper. The administrator of the province in 1928 was A. P. J. Fourie. See **SOUTH AFRICA, UNION OF**.

CAPET, LUCIEN. A distinguished French violinist, died in his birthplace, Paris, December 19. He was born Jan. 8, 1873, and after graduating, as winner of the first prize, from the violin class of J. Maurin at the Conservatoire in 1893, he organized a string quartet with Giron, Henri Casadesus, and Furet. This he disbanded in 1899, when he accepted a position as professor at the Conservatory of Bordeaux. Returning to Paris in 1903, he formed another quartet with Tourret, Henri Casadesus, and Louis Hasselmans, which soon won a European reputation, especially for its interpretation of Beethoven's quartets. In 1910 Tourret and Hasselmans resigned and were replaced by Maurice Hewitt and Marcel Casadesus and with these artists the organization continued its triumphant tours until the outbreak of the War. In 1919 Capet once more reorganized his quartet with Maurice Hewitt, Henri Benoit, and Charles Delobelle.

CAPE VERDE (vûrd) ISLANDS. A group of 14 islands off the western coast of Africa belonging to Portugal. Area, 1475 square miles; population at the census of 1926, 131,147, of whom 59,031 were males. The chief products are coffee, medicinal substances, hides, and millet. A small military force is maintained on the islands. The estimated public revenue in 1926-27 was 17,504,815 escudos and the expenditure, 17,111,690 escudos. Imports in 1926 amounted to 46,588,361 escudos and exports, 2,820,158 escudos. The chief port is Bissau. The administration is in the hands of a governor whose seat is at Praia, the capital.

CAPPER-KETCHAM ACT. See **AGRICULTURAL EXTENSION WORK; AGRICULTURAL LEGISLATION**.

CARBOLLOY. See **PHYSICS**.

CARDOZO, JUDGE BENJAMIN N. See **CRIME**.

CARINTHIA. A province of the Republic of Austria; formerly a crownland of the Austro-Hungarian Empire. Area, 3680 square miles; population at the census of 1923, 370,748, as compared with 396,200 in 1910. Carinthia, in 1923, had 5.67 per cent of the total population of Austria. Capital, Klagenfurt, with a population in 1923 of 27,423.

CARNEGIE CORPORATION OF NEW YORK. Founded by Andrew Carnegie, and chartered under the laws of the State of New York, June 9, 1911, this corporation was formed for the purpose of promoting "the advancement and diffusion of knowledge and understanding among the people of the United States." The original endowment was \$125,000,000, an amount to be increased upon the final settlement of Mr. Carnegie's estate. The income of this principal fund is applicable only within the territorial limits of the United States, but the Corporation holds also a special fund of \$10,000,000, of which the income is applicable in "Canada and the British colonies." The programme of the Corporation in 1928 was concerned chiefly with library service, the place of the arts in American life, adult education, scientific research, and educational studies. Although the Carnegie Corporation is an educational foundation, it is not an operating agency, and its activities are limited to financial coöperation with existing institutions and associations.

In 1928, as in the previous year, approximately two-thirds of the annual income of the

Corporation was devoted to a reduction of unpaid obligations, which on Sept. 1, 1928, amounted to \$21,616,662. The annual report of Pres. Frederick P. Keppel shows that during the fiscal year 1927-28, the sum of \$2,041,250 was appropriated toward (a) library service, \$140,000; (b) the encouragement of adult education activities, \$102,000; (c) the support of national organizations in the field of fine arts and of departments of arts in colleges and universities and of projects for developing appreciation of arts and music, \$487,500; (d) the support of educational and scientific studies, research, publications, \$645,750; (e) general interests, including Carnegie Endowment for International Peace, Institute of International Education, \$660,000.

From the income of its \$10,000,000 fund, the Corporation embarked upon a five-year programme in British Africa, involving a total of \$500,000. Scientific research, aid to Jeanes Schools exchange of educational visits, arts aid, library service were included in the programme which was carried on largely through responsible local bodies. The Corporation continued its policy of making scholarship grants to graduate students who proposed to become college teachers of art. It continued to support various important projects, such as research in purification of insulin, investigation of high-frequency rays of cosmic origin, coöperative research in pyorrhea and osteosclerosis, and study of the susceptibility to infectious diseases. Various studies conducted by the Society for the Promotion of Engineering Education, the Modern Language Association, the Institute of Economics, and the American Law Institute were continued through the year.

The Trustees of the Corporation in 1928 were: James Bertram, Nicholas Murray Butler, Louise M. Carnegie, John J. Carty, Samuel Harden Church, Robert A. Franks, William J. Holland, Henry James, Frederick P. Keppel, Russell C. Leffingwell, John C. Merriam, John A. Poynton, Henry S. Pritchett, and Elihu Root. Officers of administration were: Elihu Root, chairman of the board; Robert A. Franks, vice chairman and treasurer; Frederick P. Keppel, president; James Bertram, secretary; and Robert M. Lester, assistant to the president. The headquarters are located at 522 Fifth Avenue, New York. See **UNIVERSITIES AND COLLEGES.**

CARNEGIE FOUNDATION FOR THE ADVANCEMENT OF TEACHING, THE. A foundation established by Andrew Carnegie on April 16, 1905, when he placed an endowment of \$10,000,000 in the hands of 25 trustees, mostly presidents of universities and colleges, for the purpose of encouraging higher education in the United States, Canada, and Newfoundland, chiefly by providing retiring allowances for teachers in universities and colleges and pensions for their widows. The Foundation was incorporated by Act of Congress in 1906. Its resources were increased by a further gift of \$5,000,000 from Mr. Carnegie in 1908, and by appropriations of \$1,250,000 in 1913 and \$12,000,000 in 1918 from the Carnegie Corporation, which Mr. Carnegie established in 1911. At the completion of its twenty-third year in 1928, the Foundation had endowments and accumulated reserves amounting to \$31,527,000, and had distributed \$17,372,000 in retiring allowances and pensions to 1000 teachers and 500 widows, chiefly through 72 as-

sociated institutions, selected because of their educational excellence. The Foundation publishes extensive annual reports, which deal with many educational problems. Its Division of Educational Enquiry, established in 1913, has issued a score of comprehensive bulletins, dealing with medical, legal, engineering, dental, and vocational education, the training of teachers, intercollegiate athletics, and kindred subjects. Dr. Henry Smith Pritchett is president and Clyde Furst, secretary. The headquarters are at 522 Fifth Avenue, New York. See **UNIVERSITIES AND COLLEGES.**

CARNEGIE INSTITUTE OF TECHNOLOGY. A non-sectarian institution for technical education at Schenley Park, Pittsburgh, Pa.; founded in 1900. The enrollment for the autumn of 1928 was 6039, including 2453 registered in the regular day courses, and 3586 in the evening courses. For the summer session 755 students were registered, and the faculty in 1928 numbered 355, of whom 265 were on full time, and 90 on part time. The endowment of the institution was \$15,900,000 and the annual income \$794,000 (not including student fees). The Institute has a campus branch of the Carnegie Library of Pittsburgh which has 450,000 volumes. President, Thomas Stockham Baker, Ph.D., LL.D.

CARNEGIE INSTITUTE, PITTSBURGH. See **ART EXHIBITIONS.**

CARNEGIE INSTITUTION OF WASHINGTON. An organization founded in 1902 to encourage broad and liberal investigation, research, and discovery, and the application of knowledge to the improvement of mankind. The results of its investigations are made known through the scientific journals, the Institution's *Year Book*, a series of monographs which it issues, and other regularly established channels. During the year the Executive Committee authorized the publication of 18 volumes, at an estimated cost of \$72,150, including: *The Year Book*; *History of Manufactures in the United States*, vol. ii, by Victor S. Clark; *Climatic Cycles and Tree-Growth*, vol. ii, by A. E. Douglass; *Geological Comparison of South America with South Africa*, Alexander L. Du Toit; and *Archaeological Investigations in Kamchatka*, by Waldemar Jochelson.

The Institution's programme of studies and related investigations in the field of Early American History benefited by Dr. Alfred V. Kidder's visits during the year to all localities where the researches of the Institution were under way. A part of the project concerning Middle American history involves the relation of questions touching origin and development of the Maya people to those problems which are connected with the history of the earliest civilizations of Central America, Mexico, and the southwestern regions of the United States. The study of Middle American civilization involves not only architecture and art, but also a careful examination of the development of this civilization in relation to its environment, and is to include studies of the general geology, ethnobotany, and ethnozoölogy of the region up to and including the story of the specific difficulties which have beset the human group in its medical history. The object of such a project is to relate the history of the Maya people to problems of the present day, so as to provide historical evidence which will contribute directly toward the interpretation of questions of the present and the future.

The year's activities in Middle American Archaeology brought large results in terms of scientific achievement. Improvements in the organization of excavation work at Chichen Itzá, in Yucatan, enabled the investigators to spend a large percentage of their time in the study of results attained and in the consideration of the scientific significance of the work under way. In connection with the Chichen project, an exceptional piece of excavation on the Warriors Temple was brought to completion under the direction of Earl Morris. The excavation and restoration of this great structure, which contains within itself the remains of several earlier buildings, have revealed an object of great beauty, and have afforded an opportunity for the independent study of each stage in the development of the series of buildings. At Uaxactun, the principal site of excavations in Guatemala, the difficult work of establishing a camp and laying out a plan for study, carried through by Oliver G. Ricketson in past years, made possible concentrated research in 1928, the results of which were unusually valuable.

The programme of the institution in the field of plain sciences was re-stated beginning with 1928 and many important activities in these subjects were coördinated in a Division of Plant Biology under the chairmanship of Dr. H. A. Spoehr, in order to better visualize the field and the opportunities for effective co-operation among the interests concerned. A lease for five acres of land was obtained on the campus of Stanford University and provision made for a new laboratory to serve as headquarters of the Division, and for the conduct of researches in photosynthesis, taxonomic and ecologic problems, and other subjects; the Desert Laboratory at Tucson, Arizona, in charge of Dr. Forrest Shreve, carried on researches relating to arid conditions on a "campus" of approximately 800 acres of interesting desert country; at the laboratories in Carmel, California, researches on the physiology of tree growth under the direction of Dr. D. T. MacDougal, Dr. J. B. Overton, of the University of Wisconsin, and Dr. Gilbert Smith, of Stanford University, resulted in significant contributions toward the interpretation of the structure and physiological processes of the tree, at a time when such investigations are of great importance in the field of forest research.

The ship, *Carnegie*, which sailed from Washington on May 1, on its seventh cruise, extended its work beyond observations on magnetic and electric variations to include correlated aspects of physical oceanography, and carried a larger equipment of apparatus and a more widely experienced staff than on previous cruises. Other phases of the observational programme of the Department of Terrestrial Magnetism included the maintenance of two permanent observation stations on approximately opposite sides of the earth—one high in the Andes at Huancayo, Peru; the other at Watheroo in Southwestern Australia, for the purpose of investigating the natural electric currents flowing in the earth, and their relation to the phenomena of the earth's magnetic changes.

During the year the institution lost a leader in research through the death of Theodore W. Richards, who for more than twenty-five years was research associate of the institution and who during that time was engaged in the most difficult problem of the study of atomic weights.

The institution also lost Dr. J. Franklin Jameson through his resignation to accept the chair of American history established in connection with the Library of Congress. Dr. Jameson had been head of the Department of Historical Research for 23 years, and under his direction 23 volumes had been published opening the way to sources of information on American history in the principal libraries and archives of America and Europe.

Total receipts of the Institution from interest on endowment, bonds, and banks deposits, sales of publications, refunds on grants, and miscellaneous items amounted to \$27,826.197 for the year, while total expenditures, including purchase of bonds, large projects, minor grants, publications, and administration amounted to \$27,667.312. The president in 1928 was Dr. John G. Merriam; the executive committee included Elihu Root, chairman, John J. Carty, W. Cameron Forbes, John G. Merriam, Wm. Barclay Parsons, Stewart Paton, Henry S. Pritchett, and George W. Wickersham, and W. M. Gilbert was administrative secretary of the institution.

CAROLINE ISLANDS. See GERMAN NEW GUINEA.

CARRANZA, EMILIO. Mexican aviator, died July 12, in an accident near Mount Holly, N. J., while attempting a non-stop flight from Roosevelt Field, Long Island, N. Y., to Mexico City. He was born at Ramos Arizpe, Mex., in December, 1905. Shortly before his death he had won high praise and had aroused enthusiasm in Mexico and the United States by a "good-will" flight from Mexico City to Washington, D. C., undertaken as a non-stop flight, but interrupted by a forced descent in North Carolina due to fog and engine trouble. Before that attempt he had made a non-stop flight from Rockwell Field, San Diego, Calif., to Mexico City, 1575 miles in 18 hours and 40 minutes. This had won for him the title, "the Lindbergh of Mexico," and he was the most popular aviator of Mexico. He was one of the delegation of Mexican flyers which greeted Lindbergh on his arrival in Mexico in December, 1927, and the two aviators were friends. The flight to Washington was made in acknowledgment of Lindbergh's visit to Mexico by air. Carranza was a grandnephew of Venustiano Carranza, who was President of Mexico, and he held the rank of captain in the Mexican Army. He had served the government in the air during warfare against insurgents and Yaqui Indians. His death caused intense grief among the Mexican people, who were very fond of the young aviator and proud of his exploits, and there was a national funeral, with highest honors. Previously, high honors had been accorded to his body by the United States, on its removal to Mexico.

CARTON, RICHARD CLAUDE (R. D. CRITCHETT). English actor and dramatist, died at London, April 1. He was born in 1853. For a time he was on the stage at Bristol and at London, before collaborating with Cecil Raleigh on *The Great Pink Pearl* (1885), *The Pointsman* (1887), and *The Treasure* (1888). His sentimental manner in his own plays was exhibited in *Sunlight and Shadow* (1890) and in *Liberty Hall* (1892; revived at New York, 1913). His later light comedies, which were sometimes criticized for artificiality of diction, included: *The Home Secretary*; *The Tree of Knowledge*; *Lord and Lady Algy*; *The Ninth Waltz*; *A Clean State*; *The*

Rich Mrs. Repton; Lorrimer Sabiston, Dramatist; The Bear Leaders; A Busy Day; The Off-Chance; Other People's Worries; One Too Many. Among the numerous well-known players who appeared in Carton's comedies were Lewis Waller, Julia Neilson, Charles Hawtrej, Sir George Alexander, Marion Terry, William Faversham, and Weedon Grossmith. Katherine Compton, actress, the wife of the playwright, who also appeared in his plays, died May 16, 1928.

CARTWRIGHT. SIR FATEFAX LEIGHTON. British diplomat, died at London, January 9. He was born July 20, 1857. After studying at Clifton College and taking his degree at Clare College, Cambridge, he entered the British diplomatic service in 1881 as an attaché. He rose in the service, being stationed at various cities in Europe and Asia and at Mexico City, until, in 1906, he became minister resident at Munich, Bavaria. He remained there until 1908, when he was promoted to the post of ambassador to Austria-Hungary. His service at Vienna was marked by his indefatigable efforts to bring about a peaceable solution of the Bosnia-Herzegovina crisis, but he incurred thereby the ill will of the German Emperor, William II, who later indicated his unwillingness to accept Cartwright as ambassador to Germany. In 1913 failing eyesight compelled his withdrawal from public service. He was made a member of the Victorian Order in 1903, a Knight Commander of the Order of St. Michael and St. George in 1908 (receiving the Grand Cross of the same order in 1914), and he received the Grand Cross of the Victorian Order also in 1909. While in Teheran, Persia, he wrote *The Mystic Rose From the Garden of the King*, a translation of Persian poems and stories; the book was published in 1925.

CARUSON, GUGLIELMO. An Italian dramatic baritone, died in Chicago, January 9. He was born in Naples, Nov. 21, 1862, and trained in Rome by Persichini and Cotogni. He made his début in Piacenza, in 1886, as Valentine in *Faust*, and rapidly won a great reputation in Italy, Australia, and South America. He was equally famous as an oratorio singer and is especially associated with the premières of Perosi's works. At the height of his powers, he retired in 1900 and devoted himself to teaching. From 1905 until his death he resided in Chicago.

CASE SCHOOL OF APPLIED SCIENCE. An engineering college at Cleveland, Ohio; founded in 1881. In the autumn of 1928, the enrollment was 642 students. The faculty numbered 69. The summer session registration was 150. The productive funds of the college amounted to \$4,040,315, and the income for the year to \$357,109. The library contained 24,485 volumes. The Worcester Reed Warner Hydraulics and Mechanics laboratory was completed during the year at a cost of \$155,811. President, Charles Sumner Howe, Ph.D., LL.D., D.Sc.

CASUALTY INSURANCE. See INSURANCE.

CATHEDRAL. See ARCHITECTURE.

CATHOLIC CHURCH. See ROMAN CATHOLIC CHURCH.

CATHOLIC UNIVERSITY OF AMERICA. An institution of higher education at Washington, D. C.; founded in 1887. It includes graduate schools of sciences, law, and philosophy. Affiliated with it are the Catholic Sisters College for the training of teachers, Trinity College for young women, and the houses of study

of 20 religious orders. The enrollment for the autumn of 1928 was 893, distributed as follows: School of theology, 102; school of canon law, 35; school of law, 20; school of philosophy, 395; school of letters, 88; and school of sciences, 252. In the 1928 summer session there was a registration of 742. The faculty numbered 113, of whom 35 had the rank of professor, four promotions having been made from the rank of associate professor during the year. The productive funds amounted to \$2,648,778, and the income for the year to \$748,871. Among the important gifts were an additional \$100,000 from John K. Mullen of Denver, toward the erection of the John K. Mullen Memorial Library, which was under construction; and an additional \$21,000 from the Hierarchy of the United States for the erection of a home for ecclesiastical professors. The library contained 273,000 volumes. Rector, the Rt. Rev. Monsignor James H. Ryan, Ph.D., S.T.D.

CATTLE. See LIVESTOCK; VETERINARY MEDICINE.

CATTLE TICK ERADICATION. See LIVESTOCK; VETERINARY MEDICINE.

CAUCASUS, kû'kâ-sûs. A term applied to the indefinite region in southeastern Europe, comprising the isthmus which separates the Sea of Azov and the Black Sea from the Caspian Sea; formerly a government of the Russian Empire. It was divided into two districts of Trans-Caucasia and Cis-Caucasia, of which the former was divided among the three republics of Armenia, Georgia, and Azerbaijan. These afterwards separated and were respectively incorporated under the constitution of 1923, in the Union of Soviet Republics, and are now known as the Transcaucasian Federation of Soviet Republics. Consult each under its own title.

CAVALRY. See MILITARY PROGRESS.

CAVE, VISCOUNT (GEORGE CAVE). British jurist, died at Burnham-on-Sea, England, March 29. He was born at London, Feb. 23, 1856, and was educated at the Merchant Tailors' School and St. John's College, Oxford. He was called to the bar in 1880 and became a king's counsel in 1904. He acquired a large practice at the chancery bar. From 1913 to 1915 he was standing counsel for Oxford University, and from 1914 to 1915 he was attorney-general to the Prince of Wales. From 1906 until he was created a peer he represented the Kingston division of Surrey in the House of Commons. There he achieved a high reputation as an authority on such subjects as licensing, local government, and land taxation. He was solicitor general, 1915-16; home secretary, 1916-19; a lord of appeal, 1919-22, and from 1922 until immediately before his death, except for the time when the Labor government was in power, lord chancellor. He was knighted in 1915, and created first Viscount Cave in 1918. He was made a member of the Privy Council in 1915. Lord Cave resigned the lord chancellorship the day before his demise, and at the same time his advancement to an earldom was announced. For a short time, in 1927, Lord Cave was acting prime minister of Great Britain, in the absence of Premier Baldwin and Sir Austen Chamberlain, secretary of state for foreign affairs.

CELEBRATIONS. The sesquicentennial anniversaries of the great events of the War of the Revolution, as well as anniversaries of other important events continued to be celebrated dur-

ing the year. The more important of these are mentioned:

February 4. The one hundred fiftieth anniversary of the signing of the treaty of alliance with France was celebrated on Bedloe's Island, New York City, under the auspices of the Boy Scout Foundation of Greater New York assisted by representatives of various patriotic organizations. Addresses were made by Maxim Mongendre, W. Francklyn Paris, and J. Henry Smythe.

March 13-23. During this period elaborate festivities were conducted in Oslo, Norway, in commemoration of the hundredth anniversary of the birth of Henrik Ibsen, the famous dramatist. Addresses were made by specialists on his works, gala performances of his plays were presented, and other interesting entertainments were provided for the nearly one hundred official guests from 19 countries. The chief American delegates were Robert U. Johnson and O. E. Roelvaag.

March 18. The one hundred fiftieth anniversary of the British ambuscade of Colonists at Quinton occurred on March 18, and on March 20 the British massacre at Hancock's Bridge took place. These were two of the bloodiest skirmishes of the War of the Revolution in southern New Jersey. Public celebration of these anniversaries took place on May 19. A programme was arranged by the Salem County Historical Society and the Salem Chapter of the Daughters of the American Revolution, comprising addresses by Governor Moore and Attorney-General Katzenbach of New Jersey, and pilgrimages were made to the battlefields, where markers were placed at various spots by the representatives of the patriotic societies.

April 13. In response to an appeal by the Jefferson Centennial Commission of the United States, the patriotic societies throughout the country observed with appropriate exercises on April 13 the 185th anniversary of the birth of Thomas Jefferson, author of the Declaration of Independence and third President of the United States.

April 17-23, was celebrated as Centennial week for Columbus, Ga., which was incorporated in 1828 during the Administration of Gov. John Forsythe. It was also Centennial Week for the *Enquirer-Sun*, which was founded by Mirabeau B. Lamar, who left Georgia and was elected vice president and then President of the Republic of Texas. Preparations for this centennial brought to light many interesting facts, personal and historic. The links of it extended from Harvard University into New York, then to Baltimore, through Georgia and on to Texas.

May 5. One hundred and fifty years of friendship between France and the United States was observed at Valley Forge with a pageant and with addresses by Gen. Charles P. Summerall, Chief Justice Robert von Moschzisker of Pennsylvania, and others describing the growth of the two nations' amity and predicting a continuance of friendly feeling. In addition to the pageant there was presented Joseph Addison's tragedy *Cato* which was enacted before General Washington and a distinguished audience in May, 1778, by officers of the Continental Army. The programme was arranged by the Valley Forge Park Commission, the Pennsylvania Historical Society, the Pennsylvania Federation of Historical Societies, and the Huguenot Society of Pennsylvania.

May 20. A solemn mass commemorating the sesquicentennial of the mass celebrated aboard the flagship, *Languedoc*, one of the French fleet on its way to bring the aid of France to the American Revolutionists, was celebrated by Cardinal Dougherty in the Cathedral of Saints Peter and Paul in Philadelphia, Pa.

June 2. The centenary of the beginning of the Chesapeake and Ohio Canal on the banks of the Potomac River near Washington, D. C., was celebrated with a historic pageant, and on

June 4, a bronze tablet was unveiled on which was the inscription: "Lockkeeper's house, formerly the eastern terminal of the Chesapeake and Ohio Canal, erected about 1835. The canal passed along the present line of B Street in front of the house, emptying into Tiber Creek and the Potomac River."

June 28. The one hundred fiftieth anniversary of the battle of Monmouth was celebrated in Freehold, N. J., with a military parade, various civic ceremonies, and terminating with a pageant depicting the battle and the famous incident of Molly Pitcher serving her husband's gun.

June 29-July 3. The sesquicentennial anniversary of the battle of Wyoming was celebrated in Wilkesbarre, Pa., by a historic pageant in which 6000 persons reenacted that event. An entire village of Miami Indians was moved from Wabash, Ind., to Wilkesbarre in order to participate in the pageant.

July 1-4. The anniversary of the signing of the Declaration of Independence brought to a close in Wilkesbarre, Pa., the three-day celebration of the sesquicentennial of the Wyoming Valley massacre, which took place on July 3, 1778. Fifty bands and more than 150 floats depicting Wyoming Valley history and tradition, were in the procession. The exercises were concluded with a presentation of the "Pageant of Wyoming Valley," in which more than 6000 persons participated.

August 15-19. The sesquicentennial anniversary of the discovery by Capt. James Cook of the Hawaiian Islands was elaborately celebrated. The programme included events held on three of the islands, with native pageants and ceremonies depicting the landing of Captain Cook and his reception by the natives at Waimea, Island of Kauai, in 1778. On the Island of Hawaii, at Kealahakua Bay, a tablet marking the spot where the discoverer was killed was dedicated. Native feasts, pageants, and receptions were held in Honolulu and the anniversary programme provided excursions to Kilauea Volcano and other points of historic and scenic interest in Hawaii. Included also in the programme were a series of addresses by eminent scholars and authorities on political, diplomatic, commercial, geographical, and maritime sciences showing the results of the discovery, which later will be published. A souvenir half-dollar with an issue of 10,000 copies was authorized by Congress, and the Post Office Department placed on sale a special issue of the 2-cent and 5-cent stamps of the current issue, surcharged "Hawaii 1778-1928" in black ink. The United States was officially represented at the celebration by Secretary of War Davis.

August 16. The twenty-fifth anniversary of the first success of the Wright Brothers was celebrated by 400 planes of the combined air squadrons of the army, navy, and marine corps which

presented a mammoth display of the United States air forces in aid of the dedication of San Diego's (Calif.) new airport.

August 29. The one hundred fiftieth anniversary of the battle of Rhode Island was celebrated in Newport, R. I., with early morning exercises at the revolutionary earthworks known as Fort Barton in Tiverton. The celebration continued throughout the day, passing at noon to Butts Hill in Portsmouth, then to Newport where a military parade took place and ended on Newport Beach, where a banquet was held.

September 10-15. The centenary anniversary of the birth of Leo Tolstoy was celebrated in Moscow, Russia, and elsewhere with memorial meetings, concerts of his favorite pieces, performances of his plays, and special exhibits at his home and in museums. Representatives of various organizations, including the Academy of Arts, the Academy of Sciences, the Union of Literary Societies, all theatres, conservatories, and the Society of Former Political Prisoners, participated in the Moscow celebration.

September 12. The one hundred seventy-third anniversary of the birth of Chief Justice John Marshall was celebrated in Fort Royal, Va., under auspices of the Shenandoah National Park Highway Association. Judge John Barton Payne presided. Representative R. Walton Moore, William E. Carson, chairman of the Virginia State Conservation and Development Commission, Judge Frank S. Tavenor of Shenandoah, and others made addresses.

September 12. The one hundred fourteenth anniversary of the bombardment of Fort McHenry and the writing of "The Star-Spangled Banner" was celebrated in Baltimore, Md., by the dedication of the restored fort as a National shrine with patriotic exercises, including a parade and addresses by Governor Ritchie of Maryland and F. Trubee Davison, the Assistant Secretary of War.

September 16. The one hundred forty-first anniversary of the adoption of the Constitution was celebrated on the steps of the Sub-Treasury building in New York City, under the auspices of the New York Chapter of the Sons of the American Revolution. Brig. Gen. Louis W. Stotesbury delivered the address of the day on "The Constitution." A commemorative wreath was placed on the statue of President Washington by Louis Annin Ames, Past President-General of the Sons of the American Revolution.

September 24. The fiftieth anniversary of the naming of Leadville, Colo., was celebrated with pageantry reminiscent of the day when pay ore was first dug there. More than half a billion of dollars' worth of ore has been taken from the mines.

October 28. The tenth anniversary of the founding of the Republic of Czechoslovakia was celebrated in Prague with parades, addresses, and other patriotic exercises.

October 28. The one hundred fifty-second anniversary of the Battle of White Plains was celebrated in White Plains, N. Y., with a patriotic meeting sponsored by the White Plains Chapter, Daughters of the American Revolution, at which appropriate addresses were made.

November 11-12. The tenth anniversary of the signing of the Armistice that brought to an end the hostilities of the World War was largely celebrated throughout the United States, but most conspicuously in New York City and Wash-

ington, D. C. Sermons appropriate to the occasion were preached in various churches on Sunday while on Monday wreaths were placed on monuments and memorials with suitable addresses, and other ceremonies.

November 15-20. A series of musical festivals and memorial exercises to mark the hundredth anniversary of the death of Franz Schubert were held throughout the world, conspicuously in Vienna, Austria, where a fountain commemorating his genius was dedicated on November 18. See SCHUBERT CENTENARY.

December 9. The centenary of the publication of Webster's *American Dictionary* was celebrated in New Haven, Conn., by an exhibition in Woolsey Hall of documents concerning the dictionary, including manuscripts and the printed works of Noah Webster, and of books illustrating the history and evolution of English dictionaries.

December 17. The 25th anniversary of the first airplane flight by Orville and Wilbur Wright was celebrated at Kitty Hawk, N. C., by the laying of the corner stone of a monument to be erected by the United States Government in honor of the first flight of a heavier than air machine carrying a person. This event was preceded by a meeting in Washington, D. C., of an International Civil Aeronautics' Conference which was attended by 200 aviation experts from 40 nations, including Orville Wright and Charles A. Lindbergh. See AERONAUTICS.

WASHINGTON BICENTENNIAL COMMISSION. During the year there was published by the commission in pamphlet form "Statements and Proposed Plans Submitted by the Historian, Professor Albert Bushnell Hart, to the United States Commission for the Celebration of the Two Hundredth Anniversary of the Birth of George Washington" in which were suggested activities for the year 1928 to include the appointment of State Committees, local societies, and other agencies to cooperate with the Commission. It also contained statements of the various plans (about 40 in number) suggested, some of which were mentioned in the YEAR BOOK for 1927 (p. 167) and how they might be carried out. Of these plans, that authorizing and directing the "survey, constitution, and maintenance of a memorial highway to connect Mount Vernon, in the State of Virginia, with the Arlington Memorial Bridge across the Potomac River at Washington" passed Congress, and was approved by the President: A bill appropriating \$300,000 for the publication of George Washington's writings and miscellaneous manuscripts to be prepared under the direction of the Commission was passed by the Senate but failed of action in the House.

CEMENT. According to preliminary totals compiled by the U. S. Bureau of Mines from reports from practically all the important manufacturing plants, there was an increase of 1.6 per cent in production of portland cement in the United States and 2.1 per cent in shipments over the final totals for 1927. These increases, however, were somewhat less than corresponding increases for 1927, over the previous year, which were 4 and 5 per cent, respectively. During 1928 the plants operated at 74.0 per cent of their capacity as compared with 73.9 per cent in 1927,

based on the total estimated output of 159 plants at the close of December, 1928, and 155 plants at the close of 1927.

The following table gives the final estimates for 1928 by districts, compared with the figures for 1927, for both production and shipments.

PRODUCTION AND SHIPMENTS OF FINISHED PORTLAND CEMENT IN 1928, BY DISTRICTS
[In thousands of barrels]

District	Production		Shipments	
	1928	1927	1928	1927
Eastern Pa., N. J., & Md.	39,277	42,687	39,436	41,657
New York & Maine ^a	11,481	10,776	11,353	10,531
Ohio, Western Pa., & W. Va.	18,336	17,339	18,036	17,302
Michigan	13,900	13,965	14,041	13,708
Wis., Ill., Ind., & Ky.	22,684	22,022	22,593	22,395
Va., Tenn., Ala., Ga., Fla., & La.	15,936	16,016	15,732	15,530
Eastern Mo., Ia., Minn., & S. Dak.	16,687	14,358	16,503	14,567
Western Mo., Nebr., Kans., & Okla.	10,931	10,093	11,220	10,251
Texas	6,345	5,656	6,277	5,692
Colorado, Montana & Utah	2,744	2,179	2,575	2,294
California	13,704	14,581	13,745	14,433
Oregon & Washington	3,943	3,535	3,944	3,605
	175,968	173,207	175,455	171,865

^a Maine began producing in April, 1928 and shipping in May, 1928.

In 1927 the imports of hydraulic cement were 2,050,180 barrels, valued at \$2,956,451, and exports 816,726 barrels, valued at \$2,796,717. In 1928 the imports amounted to 2,192,729 barrels, valued at \$2,945,750; exports amounted to 824,656 barrels valued at \$2,938,702.

CENSUS. According to the report of W. M. Steuart, director of the Bureau of the Census, for the fiscal year ended June 30, 1928, preliminary work in preparation for the fifteenth decennial census of 1930, was in active progress. The census probably would cover population, agriculture, manufactures, distribution, mining, irrigation, and drainage, and in order to facilitate the accurate handling of large amounts of data, the department had been developing new machines for punching, sorting, and tabulating.

The collection of data for the census of institutions for 1926, dealing with prisoners, mental patients, and feeble-minded and epileptics, was completed, and preliminary summaries were issued. Work on the 1927 and 1928 reports proceeded satisfactorily. The survey of the financial statistics of the State governments for the fiscal year ending Dec. 31, 1927, was completed, and the report on this subject covering the same period of time, in the 250 cities having a population of 30,000 inhabitants or over, was in preparation, 132 such reports having been issued by the close of the fiscal year. As a result of many urgent requests, mimeographed revisions of the *Digest of State Laws Relating to Taxation and Revenue* (1922) were issued for the 45 States which levied inheritance taxes, and for the 12 States levying a tax on incomes.

The *Survey of Current Business*, a monthly summary of the reports of the department, carrying more than 1700 statistical series, about 100 of which were added in the fiscal year 1928, was supplied with data by 49 government agencies, 117 commercial and trade organizations, 35 trade and technical periodicals, and 42 private organizations. Weekly charts, and the quarterly forecasts of carloadings by the regional advisory boards were new features which added to the usefulness of the publication. The efforts of the vital statistics department to have all States enrolled in the birth and death registration areas succeeded in adding two States to the latter, and four to the former category. For summaries on

vital statistics and marriage and divorce, see articles under those titles.

* The seventh census of religious bodies (1926) was based on information secured directly from the individual churches, congregations, etc., and in connection with it many requests to include

a religious inquiry in the decennial census were made. Work in securing data for the biennial census of manufactures (1927) was carried forward with the cooperation of local chambers of commerce, boards of trade, etc., who in return were sent preliminary summaries of the reports. On Jan. 9, 1928, schedules were mailed to about 324,000 establishments, including 153 special schedules covering 226 of the 340 industries listed under the census classification, as compared with 87 such schedules, covering 119 industries, in the 1925 census. On May 28 the first preliminary report on aircraft was published, and by the end of the fiscal year 187,179 answers, or 93.1 per cent, were on file. Quarterly, semi-annual, or annual data on production were also collected by the department.

The first census of distribution (1927), taken in 17 cities, was completed, giving statistics for 93,928 retail and 17,012 wholesale establishments. The statistics enabled merchants to avoid duplications, etc., and a demand was made to include a national census of distribution in the fifteenth census, provision for this having passed the House of Representatives, and preliminary work being begun. Besides the annual collection of data concerning agriculture, a quinquennial census was made in 1925. A \$55,000 deficiency appropriation was voted so that more statistics and correlations of the data of the census might be compiled for the Department of Agriculture. The census of water transportation for 1926 was completed, and gave the American fleet, exclusive of Hawaiian and Porto Rican vessels, as numbering 42,286, with a gross tonnage of 21,666,814. Of these ships, 4737, with a gross tonnage of 3,310,977, were idle throughout the year.

The five-year census of electrical industries was taken for 1927, and of the 90,000 questionnaires mailed in January, 1928, 67,000 were answered by June 30. The data received from this census were to be correlated with those from the census of manufactures, making the most complete data on electric power equipment ever collected in the United States.

CENSUS, WORLD AGRICULTURAL. See AGRICULTURE.

CENTRAL AMERICA. The term generally applied to the southern portion of the North American continent lying to the north of the

Panama Canal and south of Mexico and consisting of the five states, Costa Rica, Guatemala, Honduras, Nicaragua, and San Salvador. See the articles on these respective countries. See EXPLORATION.

CENTRAL STATIONS. See DYNAMO-ELECTRIC MACHINERY; POWER PLANTS, STEAM.

CEREAL DISEASES. See BOTANY.

CEREALS. See BARLEY; OATS; RYE; WHEAT.

CEYLON, sē-lōn'. An island in the Indian Ocean off the southern extremity of Hindustan, belonging to Great Britain. Its extreme length from north to south, i.e. from Point Palmyra to Dondra Head, is 266 miles; its greatest width 140½ miles from Colombo on the west coast to Sangemankande on the east coast. Area, 25,332 square miles; population, at the census of 1921, 4,504,549, as compared with 4,106,350 in 1911; estimated at the end of 1925, 5,009,501. The registered movement of population in 1926 was as follows: Births, 206,888; deaths, 124,884; marriages, 28,756. The chief cities with their populations in 1921 were: Colombo, 244,163; Jaffna, 42,436; Galle, 39,073; and Kandy, 32,047. The number of vernacular schools in 1926 was: Government schools, 1101, attended by 113,137 boys and 54,778 girls; aided schools, 1821, attended by 129,990 boys and 88,302 girls; unaided schools, 1085, attended by 16,485 boys and 7024 girls; English and Anglo-vernacular schools, 384, attended by 57,225 boys and 16,098 girls.

Ceylon is almost entirely agricultural and specializes in export crops. Plantation tea, rubber, and coconuts make up the bulk of its products, but considerable amounts of cacao, cinnamon, citronella grass, and miscellaneous products are grown, largely by individual native farmers. Considerable rice is also raised, but more than half of the country's total consumption of this food supply is imported from India and other sources. Specializing in export crops as Ceylon does, its export record is an excellent gauge of its prosperity. The volume of exports in 1926 reached £33,576,599. Tea was the ranking product of the island, but rubber was rapidly approaching it in value of output. During 1926 a total of 217,000,000 pounds of Ceylon tea, valued at 213,000,000 rupees, was exported, as against 209,800,000 pounds valued at 199,697,000 rupees in 1925. Black tea is produced almost exclusively. While the distribution of Ceylon tea is very wide, the great bulk of it goes to English-speaking countries. Other important exports in the same year were: desiccated coconuts (754,000 cwts.); copra (2,400,000 cwts.); and coconut oil (570,000 cwts.). Of the 131,840,500 pounds of rubber exported, 81,625,400 pounds went to the United States and 40,806,600 to the United Kingdom. In 1926, 13,560 acres of Crown land were sold and settled. The livestock in the same year was reported to amount to 1500 horses, 1,537,000 horned cattle, 62,000 sheep, 48,000 swine, and 183,000 goats. Imports in 1926 amounted to £27,191,141. Nearly one-quarter of Ceylon's imports is made up of husked rice, obtained almost entirely from British India. Rice imports in 1926 amounted to 8,795,000 cwts. as against 8,321,000 for 1924. The bulk of the remainder of the imports is made up of cotton piece goods, coal, fertilizers, refined sugar, crude petroleum, kerosene, automobiles, fish, and gasoline.

The chief mining interest is plumbago, 65

mines being in operation at the end of 1926, and the exports in that year being 232,000 cwts. Gold, thorium, and monazite exist to some extent but have scarcely justified exploitation on a commercial scale. Gem quarries abound throughout the island and among the precious stones found are moonstones, rubies, cat's-eyes, and sapphires. The native manufactures include weaving and the making of tortoise-shell boxes, earthenware, lacquer work, jewelry, carving, etc. They are not of much commercial importance, however. The chief manufactures on a large scale pertain to agricultural products, including the extraction of coconut oil.

The revenue in 1925-26 was £8,301,077 and the expenditure £7,333,089. The shipping which entered and cleared in 1926 totaled 20,403,000 tons. At the end of December, 1926, there were 851 miles of railway open to traffic and several extensions were under construction. The administration, as embodied in an Order in Council of December, 1923, is in the hands of a governor, aided by an executive council of nine members, and a legislative council of 49 members (12 official and 37 unofficial). Of the unofficial members, 23 are elected to represent the territorial divisions, two to represent the Europeans, two the Burgher Community, one the Chamber of Commerce, one the Western Province Tamils, three the Mohammedans, and two the Indians.

During the year there was considerable speculation over the report of the Ceylon Commission, which had been appointed to study the governmental system described above. The Commissioners had been sent to Ceylon because the existing machinery of government had been a source of exasperation to officials and elected members alike and was the cause of well founded anxiety for the future. The report stated that nothing of real value was being done for the Ceylonese themselves and made the rather radical suggestion, that, with a few exceptions, the elected members should run the government and Ceylon should become a self-governing colony, practically on the same basis as Canada or Australia. Needless to say this report was rejected by the Baldwin government. Governor in 1928, Sir Herbert James Stanley.

The Maldivé Archipelago, consisting of 13 coral islets, 400 miles west of Ceylon, is tributary to Ceylon. They are sparsely settled by a mixed race of probably pure Aryan stock and governed by a native Sultan. The islands are covered with coconut palms, and yield millet, fruit, and coconut produce. The population numbered over 70,000 in 1921. The islanders are civilized and are great navigators and traders.

CHAMBERLAIN, GEORGE EARLE. American legislator and public official, died at Washington, D. C., July 9. He was born near Natchez, Miss., Jan. 1, 1854, and was graduated from the academic and law departments of Washington and Lee University in 1876. Taking up the practice of the law in Oregon, he early became prominent politically in the State as a Democrat. He was in succession a member of the State legislature, district attorney for the Third Judicial District, attorney-general of the State and, having removed to Portland, district attorney for the Fourth Judicial District. In 1902 he was elected Governor of Oregon, and in 1906 was re-elected. Three years later he was chosen United States Senator from Oregon for the term ending

1915. In the first session of the Sixty-third Congress he was chairman of the public lands committee, and he was also a member of numerous other important committees. He was reelected to the Senate for the term 1915-21, and during the period of the American participation in the World War held the important post of chairman of the Senate Military Affairs Committee. He was an outspoken advocate of preparedness and was the author of the military preparedness act of 1918. After his retirement from the Senate in 1921 he was appointed by President Harding a member of the U. S. Shipping Board for the term 1921-25. From the latter year until his death he practiced law at Portland, Ore., and Washington, D. C., and was engaged in important cases, among them being the one involving the Oregon school law, argued before the U. S. Supreme Court. Mr. Chamberlain represented the State in that case.

CHAMBERLIN, THOMAS CHROWDER. American geologist, educator, and originator of the planetesimal hypothesis, died at Chicago, November 15. Born at Mattoon, Ill., Sept. 25, 1843, he was graduated from Beloit College in 1866, and did post-graduate work at the University of Michigan, 1868-69. He became professor of natural science at the State normal school at Whitewater, Wis., and returned to Beloit as professor of geology in 1873, resigning in 1882 in order to continue research in geology. He also served as assistant State geologist of Wisconsin, 1873-76, and as chief geologist, 1876-82, and studied glaciers in Switzerland in 1878. He was geologist in the U. S. Geological Survey in days of the glacial division 1882-1907. He was appointed professor of geology at Columbian University in 1885, leaving in 1887 to accept the presidency of the University of Wisconsin, where he remained until 1892. He then joined the University of Chicago, as head of the geology department, and director of the Walker Museum. On his retirement, Oct. 1, 1919, he was made professor emeritus.

He was selected to accompany the Peary relief expedition in 1894. Among Chamberlin's other appointments were those as consulting geologist for the Wisconsin and the U. S. Geological Surveys, as commissioner of the Illinois survey, investigator of fundamental geological problems for the Carnegie Institution of Washington, 1902-09, and research associate for that foundation from 1909 until his death.

Chamberlin's work definitely advanced scientific understanding. Observing the quantity of spiral nebulae made visible by modern telescopes, he, with the aid of the astronomer, Forest Ray Moulton, evolved a cosmogony which superseded the formerly accepted explanations of the creation of the universe. Chamberlin's "planetesimal hypothesis" combined the nebular and meteoric theories, stating that planets are formed by accumulations of fast-moving matter which adheres to primitive nuclei by their rotational force. These planets, according to Chamberlin and Moulton, originated when another sun attracted the surface nebulae from our own sun, and, passing out of ken, left the rotating matter still under the influence of the main body. Chamberlin also contributed interesting scientific theories arising from his examinations of existing glaciers, and of glacial deposits in the northern United States.

Besides being president of the Chicago Acad-

emy of Sciences, 1898-1914, Chamberlin was president of the Illinois Academy of Science, 1907, and of the American Academy for the Advancement of Science, 1908, and he served on the commission for Oriental educational investigation, 1909. He also belonged to the American Academy of Arts and Sciences. He received the Ph.D. degree from the universities of Michigan and of Wisconsin in 1882, and the LL.D. degree from the University of Michigan, Beloit College, and Columbian University in 1887, and from the University of Wisconsin in 1904, and Toronto University in 1913. He was also given the degree of Sc.D. by the University of Illinois in 1905, and by the University of Wisconsin in 1920. Of the scientific books published during a period of extraordinary astronomical discoveries, Chamberlin's *The Origin of the Earth* (1916) was considered among the most significant. He edited the *Journal of Geology* for a number of years, and wrote more than a hundred scientific books and papers, including: *Outline of a Course of Oral Instruction* (1872); *Geology of Wisconsin* (1877-83); *Contribution to the Theory of Glacial Motion* (1904); *General Treatise on Geology* (with R. D. Salisbury, 1906); and *The Two Solar Families, The Sun's Children* (1928).

CHAMBER MUSIC. See MUSIC.

CHAMBER OF COMMERCE OF THE UNITED STATES.

A national federation of more than 1600 business organizations with headquarters at Washington. The Chamber was organized in 1912 primarily as a vehicle for the expression of national business opinion on important economic questions. The President of the United States and other government officials aided in its establishment and it has since served as an agency for the coöperation of business and government in the furtherance of national economic policy, holding itself ready at all times to advise the government regarding the needs of business and the possible economic effects of legislative measures. Membership in the Chamber consists of trade associations and local or regional chambers, these groups being represented on the Board of Directors, composed of 34 members chosen from geographical districts or specific fields of business. Policies of the Chamber are formulated only by resolution adopted at its meetings or by direct referendum, in order that they may reflect as accurately as possible the opinion of all classes of business represented in the constituent membership.

For the convenience of its members the Chamber maintains at its Washington headquarters service departments covering the main divisions of business activity. These departments are Finance, Transportation and Communication, Manufacture, Domestic Distribution, Foreign Commerce, Agriculture, Natural Resources, Insurance, and Civic Development. Two other departments, Commercial Organization, and Trade Association, deal with the activities of local chambers of commerce and of trade associations, and a third, the Research Department, covers the general field of business research. The Chamber also publishes a monthly magazine, *Nation's Business*, and issues from time to time reports on economic subjects.

Among the questions to which the federation directed its attention during the year 1928, as a part of its programme of activities, and which were to continue on its programme for 1929, were agriculture; street and highway safety;

produce exchange trading; banking in relation to the Federal Reserve System; establishment of standards of trade practice; commercial aviation, distribution census, business education and immigration; wholesaling; foreign trade policies; taxation with particular reference to the systematization of State and local taxation; special insurance taxes, development of national water power and forestry policies; human relations in industry; and national expansion. These questions reflect the Chamber's policy of following closely all the larger trends of business development and aiding in the carrying out of economic policies formulated by its membership.

In addition to the board of 34 directors, each elected for a term of two years, there were the following officers for 1928: President, William Butterworth, Moline, Ill.; chairman of the board, Joseph H. Defrees, Chicago, Ill.; vice presidents, A. J. Brosseau, New York, Robert P. Lamont, Chicago, Robert H. Ellis, Memphis, Tenn.; Paul Shoup, San Francisco; treasurer, Judge Edwin B. Parker, Washington, D. C.; and secretary, D. A. Skinner, Washington, D. C.

CHARITY ORGANIZATION. See **RUSSELL SAGE FOUNDATION**.

CHARLES, SIR JAMES THOMAS WALTER. English sea captain, commodore of the Cunard Company's fleet, died at Southampton, England, July 15. He died a few hours after completing his last voyage before his expected retirement. He was born at Hursley, England, Aug. 2, 1865. He was educated privately, and went to sea in a sailing vessel in the British merchant marine, as a boy before the mast, in 1880. By the time he was 26 he had seen service in many parts of the world. He became a sub-lieutenant in the Royal Naval Reserve in 1891 and a lieutenant in 1895, the year in which he entered the service of the Cunard Line, as fourth officer of the *Cephalonia*. Five years later he became chief officer of the *Etruria*, and in 1904 he received his first Cunard command, that of the *Aleppo*, a cargo ship in the Mediterranean service. He had reached the rank of commander in 1907, and in 1914 attained that of captain. His commands included vessels of ever increasing size, until he was entrusted with the *Lusitania*, before the World War, and the *Mauretania*. In March, 1918, he was placed in command of the *Aquitania*, in which 47,867 American soldiers were carried across the Atlantic Ocean without the loss of a man. In recognition of his war services he was made an aide of King George of England and promoted to the rank of Knight Commander of the Order of the British Empire. He had been made a Companion of the Order of the Bath in 1911 and a Companion of the Order of the British Empire in 1919. Sir James became commodore of the Cunard fleet in 1921. Throughout his career at sea, in which he crossed the Atlantic Ocean 726 times, he was especially interested in the subject of safety at sea, and served as member of a committee on boats and davits, 1912-13, and as nautical adviser to the British delegation, participating in the International Conference on Safety of Life at Sea, 1913-14.

CHAUTAUQUA INSTITUTION. An educational movement established in 1874 by Lewis

Miller and Dr. John H. Vincent, both prominent in the Methodist Episcopal Church. The institution is non-sectarian in principle, although the original idea of the organization was a Sunday school for teachers where a series of correlated lectures and entertainments were presented during the months of June, July, and August. The three general fields of activity are the general assembly, consisting of an educational and popular series of lectures and addresses, concerts, and dramatic entertainment, etc.; the summer schools, offering courses of formal class-room instruction; and a home reading circle in which a set of four books is designated for reading during the year, in addition to a news narrative appearing in a monthly review. In 1928 there were 19 departments in the summer school, with 125 instructors and 2500 students, while the attendance at the annual session was estimated at 45,000. Financial support is obtained largely through individual gifts. Permanent buildings, valued at \$1,250,000, are owned by the institution at Chautauqua, N. Y., where the general summer assemblies are held and the Chautauqua Press is located. Officers: George E. Vincent, honorary president; Arthur E. Bestor, president; William L. Ransom, chairman of trustees; Shailer Mathews, chairman of the executive board; Charles E. Peirce, secretary; and Jessie M. Leslie, treasurer.

CHEESE. See **DAIRYING**.

CHEMICAL INDUSTRY, SOCIETY OF. See **CHEMISTRY, INDUSTRIAL**.

CHEMICAL SOCIETY, AMERICAN. See **CHEMISTRY, INDUSTRIAL**.

CHEMISTRY. In no branch of science is the advancement of knowledge so distinct as in chemistry and perhaps in no branch of science is the advancement so inconspicuous. The demonstration of these facts lies, however, in the enormous amount of literature descriptive of experimental work that is put out in every part of the civilized world in technical journals. Some of these contributions are indicated in the paragraphs that follow.

NEW ELEMENTS. Prof. B. S. Hopkins, of the University of Illinois, whose discovery of the element illinium was reported in 1926 (see **YEAR BOOK** for 1926, p. 149), announced the continuance of his search for the two elements not yet discovered. These he describes as similar to radium in being radioactive and both should be short-lived; that is, they should disappear after their isolation. No one knows when such elements as gold, silver, mercury, copper, tin, and lead first found a use among early peoples. These are elements which are found in nature in the uncombined form or are easily obtained from their compounds by simple processes. In discussing the evolution of the elements, B. Cabrera assumes (*Comptes rend.*, vol. 186, p. 228) the formation of atoms by means of the association of protons and electrons in the light of Aston's conception of "packing fractions" and makes special reference to the building up and disruption of atoms by cosmic processes, and also refers to the stability of an atom in terms of its radioactive properties.

ATOMIC WEIGHTS. Notwithstanding the great loss that came to this branch of chemistry by the death of Prof. T. W. Richards (q.v.), the foremost authority on the determination of atomic weights in the world, the work was to be still carried on by his associates in Harvard University and by

his pupils and admirers in the laboratories elsewhere.

According to J. Kaplan (*Physical Rev.*, vol. 30, p. 639) atomic hydrogen was passed from a discharge-tube into a 3-litre glass bulb, its presence being indicated by glowing thoria. The glow persisted for 3 seconds after interruption of the discharge, and white action spots on the glass for 6 seconds after interruption. Possibly atomic hydrogen can exist for 10 seconds. The atomic weight of titanium by analysis of titanium bromide was determined by G. P. Baxter and A. Q. Butler (*Jour. Am. Chem. Soc.*, vol. 50, p. 408) and the results gave 47.90 as the correct figure (silver being 107.88) which is in agreement with previous results. The atomic weight of copper was redetermined by R. Ruer and his results (*Zeit. anorg. Chem.*, vol. 169, p. 251) gave 63.544 ± 0.003 as the correct weight. The atomic weight of uranium was redetermined by O. Hönigschmidt and W. E. Schilz (*Zeit. anorg. Chem.*, vol. 170, p. 145) resulting in 238.14 being the atomic weight as redetermined by these chemists. A redetermination of the atomic weight of caesium by T. W. Richards and M. Françon (*Jour. Amer. Chem. Soc.*, vol. 50, p. 2162) confirmed the accepted atomic weight of that element, namely 132.81 (with silver accepted as 107.880). The analytical data were obtained by using caesium chloride. Some recent determinations of the atomic weight of silver made by O. Hönigschmidt (*Zeit. Elektrochem.*, vol. 34, p. 325) in the Munich laboratories gave (with nitrogen as 14.008) silver as 107.880 and 107.879. In later experiments on the ratio barium perchlorate (barium chloride) silver gave silver 107.880 with oxygen at 16.

ANALYTICAL CHEMISTRY. Under this heading improved forms of apparatus are discussed, and also improved methods for determining the constituents of a given compound. Both are important factors in the development of chemistry.

In March the U. S. Bureau of Mines reviewed the means of detecting the amount of carbon monoxide in mines, and published a description with directions for the use of an iodine pentoxide detector, the most essential feature of which is a small glass tube containing granular pumice stone impregnated with a mixture of iodine pentoxide and fuming sulphuric acid. This mixture is called hoolamite, after Hoover and Lamb, who patented the formula. When air containing carbon monoxide is forced through the tube by means of a rubber aspirator bulb and suitable valves, iodine is liberated and the original white of the granules is changed to various shades of bluish green or even violet-brown or black, depending upon the amount of carbon monoxide.

A new form of apparatus for the determination of carbon and hydrogen was described by I. Marek (*Arch. Hemiju.*, vol. 1, p. 188), in which combustion takes place in a current of pure oxygen. A simplified method of employing the morphine reaction of Pellagris and Vulpius is suggested by L. Ekkert (*Pharm. Zentr.*, vol. 69, p. 1). It is only necessary, he says, to heat the substance or its solution with a little sulphuric acid until the original red coloration deepens finally to brown, dilute with water, and extract separate portions with ether, chloroform, and ethyl acetate respectively. The color changes at various dilutions with water and the author describes the changes with the solvents, which he

regards as due to the formation and oxidation of apomorphine. The color changes observed with several morphine derivations and allied alkaloids are also described.

Of more than passing interest is a systematic method of separation and detection of all rare earth metals, except germanium, worked out by T. Kato (*Jour. Soc. Chem. Ind. Japan*, vol. 30, p. 658). This method is given in a tabular form. A mercury-vapor lamp working at 80,000 volts is described by N. Iarotsky (*Compt. rend.*, vol. 187, p. 459) which gave the maximum short wave ultra-violet radiation at 253μ . It has the distinct advantage that it may be brought close to the subject without the use of filters to absorb thermal radiations. O. Orth (*Chem. Fabr.*, 1928, p. 492) describes a new form of automatic pipette which has a glass tap at the bottom and is expanded to a bulb at the top. The graduation mark is on the constriction below the bulb and a capillary filling tube ends on a level therewith. The pipette is filled from a wash bottle at a lower level and any surplus runs back. The filling and air release connections are either fused in or taken through a rubber stopper. An agitator designed by G. N. Quam (*Ind. Eng. Chem.*, vol. 20, p. 922) for the purpose of determining rates of corrosion of metal samples by fluids is made of soft wood and carries a number of test tubes resting obliquely toward each side which contained the sample. These were fitted with bent breathing tubes to ensure aeration. The rocking (through 30°) is controlled by a hinge on the rocker arm and by the walls of the thermostat.

BIOLOGICAL CHEMISTRY. The application of chemistry to life processes has been productive of important results, and in recent years, notably by the introduction of insulin as a panacea for diabetes. This and other similar achievements are illustrative of the potent value of biological chemistry.

At the meeting of the American Chemical Society held in Swampscott, Mass., during September it was reported that chemists working in the Sterling Laboratory at Yale University had discovered that an inorganic substance may be the cause of tubercular growth, a fact which may open up an entirely new mode of approach in the search for an immunizing agent. These chemists have prepared from the living tubercle bacilli a series of fatty acids which is new to chemistry, and when these acids have been introduced into the bodies of rabbits, tubercles like those which exist wherever tuberculosis is present, whether in human beings or animals, are formed in the bodies of these rabbits, though the animals do not manifest any of the other symptoms of the disease. That is, for the first time in experimental biology, it has been demonstrated that one of the outstanding signs of tuberculosis, the tubercle, has been generated in rabbits by a purely chemical product. Hitherto, the only way in which typical tubercular tissue, the nodules known as tubercles, could be produced was by inoculating them with the living bacillus of tuberculosis. This discovery, that a non-living substance may be the cause of tubercular growth, opens up a new mode of approach in the search for an immunizing agent. In the past there has been no way of proving whether the growth of the tubercle in tubercular organisms was the result of direct action of the living bacillus.

According to G. Embden (*Klin. Woch.*, vol. 6, p. 628) contraction of muscle is accompanied by

liberation of ammonia and this is rapidly followed by recombination. Adenosinephosphoric acid and lactacidogen are regarded by this author as active substances of striped muscle and, he believes, their special formations. According to S. G. Villimott (*Biochem. Jour.*, vol. 22, p. 67) the juice of the navel orange contains sufficient vitamin-A in 5 cc for the growth and well-being of a rat; 10 cc of Valencia orange juice are adequate for the vitamin-B requirements of a rat. Vitamin-D is not present in the navel orange juice. According to C. Lundsgaard (*Chem. Zentr.*, 1927, p. 1974), the action of insulin depends on an intramolecular rearrangement of the sugar with formation of neoglucose; sufficient insulin for the purpose is normally present. The effect of insulin depends on the presence of some substance existing in fresh muscle; if this is provided the author believes that the action can be reproduced *in vitro*.

It was found by O. Laxa (*Loit*, vol. 7, p. 617) that the dialysable portion of human milk contains sulphate, and that calcium phosphate is present in a non-dialysable form. Also various analytical data comparing the ash of human milk with cow's milk were presented by the author. Quinine, according to B. P. Shvedski (*Zhur. exp. Biol. Med.*, vol. 4, p. 605) even 1 part in 200,000 can be determined by Mayer's potassium mercuric iodide reagent. Etheral blood extracts, he finds, may give high values. Five minutes after the injection of 0.5 grains of quinine hydrochloride into animals, 82-95 per cent has disappeared from the blood. Ergosterol, identified crystallographically and by Salkowski's reaction, has been isolated by W. Küster and O. Hörth (*Berichte*, vol. 61, p. 809) from the alcohol-sulphuric extract of ox blood obtained by treatment of the whole blood by Mörrner's method. H. Wu and D. V. Wu report (*Chinese Jour. Physiol.*, vol. 2, p. 173) that rats do not grow well on exclusively vegetarian diets, although when the small Chinese cabbage is added, practically normal growth is obtained. As the normal vitamin-D content of this vegetable is low, this would seem to give the reason for this condition.

According to M. Kunitz and H. S. Simms (*Jour. Gen. Physiol.*, vol. 11, p. 641) the following improvement in dialysis is recommended. The solution to be dialysed is contained in a stoppered collodion sac with a marble or a bubble of air. The sac is placed in a test tube which is in a rocking machine, and distilled water is let into the test tube outside the collodion sac. The movement of the marble or bubble of air agitates the solution and accelerates the dialysis. A new cardiac accelerator, differing from adrenaline, was obtained by H. G. Cameron (*Endocrinol.*, vol. 10, p. 577) by fractional precipitation of a defatted neutral acetone extract of ox adrenals. It is called cardaissin. An improved modified form of the Autenrieth colorimeter is described by E. Kaufman (*Biochem. Zeit.*, vol. 197, p. 141), which may be used for the determination of blood sugar and of the oxygen capacity of blood. W. H. Dore points out (*Science*, vol. 67, p. 324) the interesting fact that the presence of boron is essential for the normal growth of tomato plants. Plants deficient in boron exhibit an excessive accumulation of sugar in the leaves which become purple.

GENERAL CHEMISTRY. Under this heading there is grouped a series of references to papers that do not seem exactly to fit in under the other

headings, but which are worthy of mention as they show some evidences of progress in the development of chemistry.

The heat of mixing a number of pairs of the metals mercury, potassium, sodium, tin, cadmium, bismuth, zinc, lead, and antimony was measured by M. Kawakami (*Zeit. anorg. Chem.*, vol. 167, p. 345). Where no compound formation occurred, the heat of mixing was, in general, negative, but in cases where compounds are known to have been formed, the heat is positive. It appears therefore probable that intermetallic compounds which can exist in the solid state do not dissociate on fusion. B. Lewis in discussing the nature of active nitrogen describes his experiments showing that ammonia is formed only when active nitrogen is mixed with atomic hydrogen, indicating that the former contains nitrogen atoms. He finds that no ammonia is produced when the nitrogen or hydrogen alone is activated and hydrazine is never formed. He contends therefore that the current interpretations of the spectroscopic data concerning nitrogen are correct, and believes that glowing, active nitrogen is probably a heterogeneous mixture of nitrogen atoms and excited nitrogen molecules.

A. W. C. Menzies in *Nature* (vol. 121, p. 457) suggests the term "dative" to describe the linking involved when one atom contributes both of the shared electrons. According to a study by A. P. Rollet (*Compt. rend.*, vol. 186, p. 748) silver sesquioxide Ag_2O_3 , the existence of which has been disputed, was formed by the anodic oxidation of a silver electrode in an alkaline solution containing potassium, with a mercury cathode. The concentrations used were 1-12N and the temperatures 0-30°C. The formation of this compound together with that of Ag_2O was confirmed from the curves relating the intensity of the current discharge and the time.

The interesting subject of free-space numbers occupied the attention of W. Herz who reports (*Zeit. anorg. Chem.*, vol. 171, p. 14) that for a number of liquids the ratio of the excess of the critical volume over the zero volume to the product of the critical volume by the free-space numbers at the critical temperature has a value of about 0.87; the value rises slowly on ascending a homologous series. It thus appears that even at 0° absolute, there are spaces between the molecules. In an interesting paper, C. S. Piggot (*Jour. Wash. Acad. Sci.*, vol. 18, p. 313) shows that the average radium content of Stone Mountain (Georgia) granite is 4.826×10^{-12} gram per gram of granite.

In studying the question as to whether aluminum has a transition point, A. Cchulze (*Zeit. Physik.*, vol. 49, p. 146) found that measurements of the electrical resistance of very pure aluminum (99.94 per cent) indicated that no allotropic change occurs in that metal in the neighborhood of 610°C. The constitution of germanium received much attention from F. W. Aston, and his experiments (*Nature*, vol. 122, p. 167) with germanium tetraethyl and tetrafluoride indicate that germanium has the following isotopes in order of descending intensity: 74, 72, 70, 73, 75, 76, 71, 77. It is unlikely that any of these lines is due to hydrogen compounds, but the intensity of Ge^76 is in doubt. Of these mass numbers only 72 and 73 are peculiar to germanium.

MINERALOGICAL CHEMISTRY. A knowledge of the composition of minerals is a valuable source of information concerning raw materials avail-

able for use in many industries. The study of other applications of chemistry to geological conditions leads to greater information concerning the formation of strata, the age of the earth, and other like subjects.

From seismological, petrological, and astronomical-geodetic considerations, S. Mohorovicic (*Arch. Hemiju*, vol. 1 p. 95) concludes that the earth consists mainly of iron, magnesium, silicon, and oxygen, while the moon contains in addition relatively more aluminum and calcium. The rigidity of the earth is a little more than three times that of the moon. Venus and Mercury probably possess a composition similar to the earth, while that of Mars is closer to that of the moon. The planetoids are of similar composition to meteorites, while the planets more distant from the sun probably resemble the fixed stars in their composition and are not yet definitely known. According to C. C. Farr and M. N. Rogers (*Nature*, vol. 121, p. 938) the formation of higher hydrocarbons from methane by alpha-particles observed by Lind and Bardwell may account for the genesis of petroleum, in view of the fact that in the middle United States, the regions in close proximity to oil fields are also regions in which the natural gases have a high helium content. Tentative calculations suggest that the formation of 1 cubic foot of helium would produce nearly 2 tons of liquid hydrocarbon.

A new mineral named *arrojadite* is announced by D. Guimaraes (*Chem. Zentr.* 1927, p. 2172). It is monoclinic, dark green, with colorless to light green pleochroism. Its hardness is about 5. This same writer announces (same reference) a new mineral from Minas Geraes, which he names *schwegite*, which is reddish gray in color and has a hardness of 5.5. A new mineral consisting of mercury and palladium (Pd Hg) was described by L. J. Spencer (*Min. Mag.*, vol. 21, p. 397) who found it among the diamond washings in the Potaro River, British Guiana. It has received the name of *potarite*. *Berthonite* is the name of a new mineral from Tunis described by H. Buttgenbach (*Ann. Soc. Geol. Belg.*, vol. 46, p. 212) the analysis of which showed its formula to be $5\text{Pbs}, 3\text{Gu}_2\text{S}_3, 7\text{Sb}_2\text{S}_3$. A new platinum *sulpharsenide* has been found in the Rustenburg norites of South Africa. Its composition expressed by the formula $\text{Pt}(\text{SAs})_2$ (*Jour. Chem. Met. Min. Soc. South Africa*, vol. 28, p. 281).

ORGANIC CHEMISTRY. This branch treats especially of the nature and properties of the carbon compounds. The outstanding event of the year seemed to be the production of synthetic gasoline, suitable as a motor fuel, from coal. Concerning the details of which see *Motor Fuel* under CHEMISTRY, INDUSTRIAL. The successful accomplishment of this synthesis presents obvious evidence of the possibilities of organic chemistry.

A method for the separation of the ovalbumin from the conalbumin was described by H. Wu and S. M. Ling (*Chinese Jour. Physiol.*, vol. 1, p. 431), which is based on the fact that ovalbumin undergoes coagulation by shaking, while conalbumin does not. It is found that 10 per cent of the total albumin of egg white is conalbumin. A report of a series of color changes, obtained when phenacetin is warmed with resorcinol and sulphuric acid, and the mixture cooled, diluted, and treated with alkalis with subsequent extraction was made by L. Ekkert (*Pharm. Zentr.*, vol. 69, p. 98). A method for the determination of selenium in organic compounds was

suggested by W. E. Bradt and R. E. Lyons (*Proc. Indiana Acad. Sci.*, vol. 36, p. 195) as follows: The substance, free from halogen was heated with nitric acid in a sealed tube, the solution being made alkaline with potassium hydroxide (free from halide), then slightly acidified with nitric acid, and then made neutral with excess of zinc oxide, and finally titrated with silver nitrate in presence of sodium chromate. E. Gruner (*Zeit. Angew. Chem.*, vol. 41, p. 446) published an extensive review of the various theories of the constitution, and of the cause of the color of ultramarine. As is well known, the principal pigment of the Indian red pummelo and the pink grape fruit is lycopin, M. B. Matlack (*Amer. Jour. Pharm.*, vol. 100, p. 243) finds that the pulp from the sweet orange, satsuma, and king mandarin give less definite tests when subjected to the Molisch microcrystallization method due to an unsaponifiable compound with a melting point of 75° that influenced the form of the crystals. Spectroscopic examination of light petroleum and alcoholic extract of orange and tangerine pulp indicated the presence of carotin and xanthophyll.

According to K. Suzuki and Y. Kaishio (*Bull. Agric. Chem. Soc., Japan*, vol. 3, p. 33) the yellow color developed when excess of a 2 per cent solution of sulphanic acid in 10 per cent sulphuric acid, and concentrated acid to produce 11–15 per cent solution are added to an aqueous solution of histidine, the mixture shaken and rendered alkaline with sodium hydroxide, is compared with that of 0.01 normal potassium dichromate solution. The chemical, physical, and pharmacological properties of some commercial esters of ophthalmic acid, and especially the methyl ester, in comparison with those of ethyl phthalate were made the subject of a valuable study by J. A. Hardy and L. F. Hoyt (*Jour. Amer. Pharm. Assoc.*, vol. 17, p. 458). An important work on the extraction of crystalline carotin-like substances from the flowers of *Ranunculus steveni* and of lycopin from rose "hips" was published during the year by H. H. Escher (*Helv. Chim. Acta.*, vol. 11, p. 752).

According to M. Dixon (*Biochem. Jour.*, vol. 22, p. 902) carbon dioxide has no effect on the rate of the autooxidation of cysteine or reduced glutathione induced by the addition of iron, copper salts, or freshly dissolved hæmatin. The last compound breaks up into a mixture of simpler compounds after keeping for several days. This mixture although retaining the catalytic power of the original hæmatin becomes susceptible to inhibition by carbon monoxide. S. Ghosh and N. M. Ghosh (*Jour. Indian Chem. Soc.*, vol. 5, p. 477) describe their method for the extraction of concessine and the details concerning the new alkaloids kurchicine (melting point 175°) and kurchine (melting point 75°) which they have succeeded in extracting from kurchi bark (*Holarrhena antidysenterica*).

PHYSICAL CHEMISTRY. The application of chemistry to problems in physics is more and more becoming a recognized method of solving important questions in science.

Among those of recent occurrence is the theory advanced by Dr. Selig Hecht of Columbia University at a meeting of the American Optical Society held in Washington on November 4. His contention was that when light falls on the eye, it strikes a known chemical substance, visual purple, which has been isolated from the rods

of the eye and subjected to extensive tests. The light apparently has a chemical effect on this purple, splitting it into two substances now known as P and A. These have not been isolated. At low intensities of light, only minute amounts of these two substances are created and they recombine immediately into visual purple. In these cases the light stimulus is below the threshold of vision and there is no consciousness of it. At higher intensities the two substances are created in such amounts that they do not recombine as fast as they are made, but either one or the other of them combines with a second substance in the eye which has not been localized and is now purely hypothetical. This second combination sets up an impulse, possibly electric, along the visual nerve fibres to the brain and the result is vision.

The scattering of hydrogen canal rays in hydrogen was determined by a thermopile method by G. P. Thomson (*Zeit. Physik.*, vol. 46, p. 93) and his results agree with those obtained by the photographic method, which is therefore thus established. A Russian chemist, E. N. Gapon, in an article (*Russ. Phys. Chem. Soc.*, vol. 60, p. 249) presents the expressions for the internal pressure of a liquid which he obtained and based on the assumption of proportionality of the total surface energy and internal pressure. From these equations he establishes relationships between contraction and expansion, and between surface tension and contraction of liquids.

See CHEMISTRY, INDUSTRIAL; PHOTOGRAPHY.

CHEMISTRY, INDUSTRIAL. No startling discovery in the development of industrial chemistry was announced during the year, but according to the reports of the papers read at the sessions of the Institute of the American Chemical Society held in Evanston, Ill., during the summer there was manifested an increasing belief in the potency of chemistry in many branches of industry, and conspicuously in agriculture. One chemist contended that there was "no question of being able to feed as many as can find standing room on this planet." He asserted that when the arable land of the earth reaches its maximum production, through intensive cultivation, the chemist can synthesize enough beyond for all possible human needs. He has already made a beginning of synthetic creation and with the light of the sun and the nitrogen of the air at his command, he can go on indefinitely. As an instance is cited the ability of 30 men working in a factory the size of a city block to produce "in the form of yeast" as much food as a thousand men can produce through the cultivation of 57,000 acres under ordinary agricultural conditions. It was also suggested that the common black mold be allowed to relieve orchards of lemons and other citrus fruits of their expensive service of furnishing acid. The theory of the indestructibility of matter gives support to this claim of the chemist. It is necessary only to recover and to transmute into new forms what use in other forms has dissipated. When the chemist finds out, for example, what "lignin" is, there will "not be any question about the utilization of surplus farm products." For every particle will find some by-use, if not needed in the form in which nature produces it.

AMERICAN CHEMICAL SOCIETY. As usual two meetings were held during the year. The first in St. Louis, Mo., during April 16-20 at which 503 papers were presented before 15 divisions and 1307 members registered. Announcement was

made that \$360,000 had been given to the Society for the support and improvement of *Chemical Abstracts*. The second meeting was held in Swampscott, Mass., during September 10-15 at which 397 papers were presented before 19 divisions. There were 1922 members present. Prof. Samuel W. Parr, who was president during the year, delivered his address on "Chemistry and the American Chemical Society." The present membership is about 16,500.

INSTITUTE OF CHEMISTRY. This organization which is a part of the American Chemical Society held its second annual session during July 23-August 18 at Northwestern University in Evanston, Ill. The gathering was made possible by a gift of \$10,000 from an anonymous donor, and \$5000 guaranteed by Northwestern University. The director was Dr. Frank C. Whitmore, head of the Department of Chemistry in Northwestern University. The aim of the Institute was to present a series of papers which were read and discussed; also there were important conferences and round table talks on various phases of chemical science. The institute was opened with a discussion entitled a "General Survey of the Problem," which was participated in by C. A. Browne, H. G. Knight, S. W. Parr, G. M. Rommel, H. J. Sweeney, and O. R. Sweeney. In Dr. Browne's address he gave the results of a questionnaire sent to prominent chemists on the leading accomplishments of agricultural chemistry during the past fifty years. The speakers explained how it was possible for chemistry to increase immensely the wealth of the farm by developing new products and new markets and by eliminating waste.

On subsequent days C. L. Gabriel, H. T. Herrick, O. R. Sweeney, W. E. Emley, and James Slayter spoke on "Corn: Products from the Grain" and "Corn: Products from the Stalks and Cobs." Their general contention being that cellulose is the cheapest thing a plant produces, manufacturing it mainly from solar energy by photo-synthesis. Trees have their value in great part on account of the cellulose which they contain. If cellulose can be profitably derived from trees which require any time up to 80 years before they are ready to harvest, why not get the same material from a plant which can be harvested within six months after the seed is sown, especially if the cellulose is found in a by-product of little value obtained in the production of a money crop of much value? It was pointed out by Professor Sweeney that there is no such sun energy trap as in the Corn Belt anywhere else on earth, certainly not where the white man can live and thrive. American industrialism should be located in the Middle West where food for men and eventually constantly renewed energy for man's machines is on tap. The concentration of a vast population on the seaboard is uneconomic. The overhead cost of maintaining such a great mass of people within 50 miles of Manhattan Island, is becoming unbearable, and Los Angeles already shivers, despite climatic advantages, at the prospect of coming thirst.

Other papers were presented on "Small Grains" and "Products from Straw and Hulls," by H. E. Barnard, W. E. Emley, and C. S. Miner, while the general topic of "Cellulose" was elaborately discussed by many chemists. Weeds, straw, molds, such as stale bread, and the stalk of and cob of corn, found speakers who communi-

cated visions of a new and more abundant wealth from their products. How the common vegetable molds, which in a former generation were considered nuisances by the housewife, have been tamed and disciplined to the uses of modern synthetic organic chemistry and fermentation was the theme of A. L. Kendall who demonstrated that these microscopic plants and their capacity to deal with nitrogen are as essential to human nutriment as Charles Darwin proved the earthworm to be indispensable to agriculture.

According to Harry N. Holmes, in the study of the structure of organic matter, the chemist dealing with colloids finds that the data which help to improve the lubrication of automobile engines aid the highway engineer and traffic executive in dealing with the drying and drainage of wet roads and assist the student of cancer.

In the continued study of economic values in refuse farm products carried on by chemists, much interesting information was brought forward. Dr. A. W. Schorger pointed out that nature is often inefficient in choosing the field for her vast operations. Thus slack pine, which grows in Washington and Oregon, has been found to grow twice as fast when transplanted to New Zealand. Certain species of carp grow four times as large, to a size of 12 pounds in fact, when changed from one stream to another. Peanut shells were revealed as a new possible source of artificial silk by R. L. Stern.

Distribution and commodity competition were fruitful themes, and Harrison E. Howe pointed out that "it costs as much to take a box of oranges from Jersey City across the river to New York and place it in the hands of the retailers as it does to pick the crop in California, sort it, pack it and ship it clear across the country." "Organic Peroxides" proved full of interest as pointed out by V. R. Kokatnur who said: "Everybody in a civilized country knows hydrogen peroxide and its general usefulness. It can be described as being composed of two parts, an oxide head and a hydrogen trunk. If this oxide head of hydrogen peroxide is attached to a trunk of a different genus such as one severed from organic compounds, we get an organic peroxide. Nature has many such organic peroxides. When a drying oil, as linseed oil, tung oil, or turpentine, dries in air, it forms a tough film of organic peroxide. In a sense the paint and varnish industry may be said to depend on this discovery. When a beautifully colored leaf or flower fades or changes its color in the autumn it is perhaps due to the bleaching of such colors by peroxide formation."

Some of these peroxides will explode with terrific force, even in water. When it is recalled that most of our present explosives are useless when dampened, it is easy to realize how important a war factor this chemical may become. Germany, Holland, and Switzerland saw its possibilities and had done some work on its development, but the United States had done very little. Peace-time application of this explosive would make the life of the farmer easier. When he has to uproot tree stumps in under-water areas, he is confronted with expensive dynamiting. Yet by merely pouring the proper peroxide in the water around the stump and igniting he could blow the stubbornest root to smithereens. But not alone in offensive warfare can the world utilize these

peroxides, for they can be used to counteract gas attacks. Mustard gas when treated with peroxide becomes tame.

Thomas Midgley, Jr., of Dayton, Ohio, discoverer of ethyl gas and an authority on synthetic rubber, said that it was hard to beat nature. "As long as rubber can be sold for about 20 cents a pound and the territory available for growing rubber is being extended, synthetic rubber will have no status." Synthetic products claimed attention and it was prophesied that vegetables are to be replaced by a new type of plant, probably grown on the Sahara Desert, which will store up tremendous amounts of energy from the sun. Fats and sugars are to come from shale oil, sawdust, and coal. Vitamins will be produced artificially or through concentrated cultivation of certain products which yield them in large quantities. By regulating vitamins, chemists expect to influence the complexion and the size of human beings. When the future citizen goes shopping for clothes, he's expected to buy clothes made out of corn stalks, sawdust, or other waste. People will live in synthetic houses. Dr. Gerald Wendt expects that "everything about the future home will be made of synthetic materials. The house will be built of concrete and steel, both synthetic materials. The walls will be finished in lacquered metals, which can be washed down with a hose. Draperies and rugs will be of rayon."

C. F. Knipp contended that "science can now make rain, but the experiment is still in the laboratory stage. Ultimately however, the work may be done in the open and when it is, the dust of the air and even the lowly coal dust will come in for greater glory, for these particles help science to make the desired precipitation." Backing his assertion with a demonstration, Professor Knipp took a vessel in which the air had been saturated with moisture just short of precipitation. When he expanded the air the moisture turned into fog. Then he introduced dust by lighting a match near the retort and allowing the smoke to filter in. Immediately the fog turned into rain. "If the air over the City of New York were right at the saturation point and we wanted rain, all we would have to do would be to blow some of the city smoke into the air and we would have rain."

Concerning "Resins," the Rev. J. A. Nieuwland said: "An interesting development of modern chemistry is that as one use for material goes out, others come in to take its place. At present there are practically no dyes made from aniline, but the production of aniline is greater than ever, since it is used for many other things, including resins. The practical importance of resin is that it can be used for more and more of man's needs, especially in relation to the use of electricity. Certain types of furniture will probably be made from resins and it is predicted that even automobile bodies, or at least parts of them, will be made from resins before long."

That chemical research may be secretly preparing new and deadlier poison gases for the next war was discussed by Sir James C. Irvine, who asserted that the country possessing the most efficient chemical industry possessed also the most efficient instrument of war. He declared that no peace treaty or visiting commissions can control or even detect research designed to furnish lethal agents for the future and that this research may be going on anywhere in

preparation for the next war. The whole machinery of war may be scrapped, warships may be sunk, armies disbanded, and fortresses demolished, but the chemical factory must remain, and, so long as it exists, it is a potential war factory.

According to Victor Cofman, who delivered five lectures on various phases of colloids, "science may harness the sun to produce sugar, may turn the waste of the present era into the foods of the future, may apply light to living organisms to aid in the growth of others and achieve similar miracles in the decades to come. But it must always stop short of the development of synthetic life in the complex form of man."

In regard to "Chemistry and Other Sciences in National Defense," H. E. Bullis said, "We have outlawed crime, but we control it by keeping our police forces prepared with the most efficient weapons. History has shown us that once in war, the weapons with which it is waged cannot be controlled. Gas will undoubtedly be used in the next war. We should continue our research work so that we may effectively protect our country." In closing it was announced that the 600 scientists in attendance at the four weeks institute had come from all over the world. Among the long-distance visitors was one who taught four years in China and another traveled 21,000 miles to attend. From Scotland came Sir James C. Irvine.

SOCIETY OF CHEMICAL INDUSTRY. Some 140 members of this society arrived in Quebec in August and after visiting Montreal, Ottawa, and Toronto in Canada, crossed into the United States and inspected centres of chemical industries at Niagara; Akron, Ohio; Pittsburgh; Washington; and Wilmington, and then held their forty-seventh annual meeting in New York City during September 3-7, at which President Carr delivered his retiring address on "Research and Chemical Industry." Also the annual presentation of the Messel Medal was made to Robert A. Millikan who gave an evening lecture on "Available Energy." The new president chosen at this meeting was Arthur D. Little, of Boston, Mass. In New York City, as elsewhere, exceptional opportunities of visiting technical plants were afforded to members of this international organization.

MEDALS. The Edison Medal of the American Institute of Electrical Engineers was awarded on Dec. 14, 1927, to William D. Coolidge of the research laboratory of the General Electric Company for his "Contributions to the incandescent electric lighting and X-ray arts." The Chandler Medal was given on Dec. 16, 1927, to Prof. Moses Gomberg of the University of Michigan for his lectures on "Free Radicals in Chemistry Past and Present," delivered at Columbia University. The Perkin Medal of the Society of Chemical Industry was awarded on January 13 to Irving Langmuir for his studies on the application of chemistry to electric lighting. The Nichols Medal of the American Chemical Society was awarded on March 9 to Prof. Hugh Scott Taylor, who fills the Jones chair of chemical research at Princeton University, for his studies in catalysis. The Willard Gibbs Medal for the best paper presented before the Chicago section of the American Chemical Society was awarded on May 25 to William D. Harkins for his paper on "Surface Structure and Atom Building." The Messel Medal of the Society of

Chemical Industry was awarded on September 4 to Robert A. Millikan for his work on the structure and relations of atoms. The Grasselli Medal of the Society of Chemical Industry for the best paper presented before any meeting of the Society during the preceding five years was awarded on November 2 to Dr. H. J. Rose for his paper on the "Importance of Coal Preparation in the Manufacture of Gas and Coke." The Chandler Medal was given on December 7 to John A. Wilson of Milwaukee, Wis., president of the American Leather Chemists Association, in Havemeyer Hall, Columbia University, when he delivered the Chandler lecture on "Chemistry and Leather."

ALUMINUM. The long-sought method for the electro-deposition of aluminum on metal was announced on August 18 by Prof. D. B. Keyes of the University of Illinois at a meeting of the American Chemical Society Institute. Aluminum by itself has very little tensile strength or elasticity. This prevents its use as a structural material in spite of its light weight. The aluminum alloys are superior in these properties, but will not stand corrosive agents. It therefore becomes necessary to apply a thin continuous coat of aluminum free from holes, to steel and other metals. As it is impossible to electro-deposit aluminum from a water solution, the new method makes use of organic metallic complexes that are liquid at ordinary temperatures, or at temperatures slightly above. It is believed that this new method will have universal application to all metals. Some possibilities are boron, the hardest known metal, which could make the headlights of an automobile outlast the car; tungsten, which would greatly lengthen the life of much of the electrical equipment; titanium, a non-corrosive, used in some paint production, and beryllium. The new method, it was thought, also would improve greatly the electro-deposition of chromium, an industrial process of importance.

HELIUM. A new helium plant, costing approximately \$700,000 it was reported in April, was to be erected and operated by the U. S. Bureau of Mines in Amarillo, Texas. This non-inflammable gas was to be extracted from natural gas out of the oil company's leases on the cliffside structure in Potter County, Texas. An important announcement was made in July that the hitherto perplexing problem of bulk shipment of helium gas, with its attendant hazards, from the Government's fields in Texas to Lakehurst, N. J., and other dirigible stations, had been solved by the construction of a railroad car built on the multiple tank principle. The value of this new conveyor lies in its adaptability to large shipments of any gas ordinarily compressed to not over 2000 pounds to the square inch. Through this means of gas transportation, supplies of carbon dioxide from waste sources may be carried hundreds of miles to big cities. A few oxygen plants henceforth can supply a territory now requiring dozens of smaller plants, because the cost of transportation is less than the cost of efficient small plants. Hydrogen, now wasted in many industries, also may be shipped to synthetic ammonia plants to be converted into fertilizer. Waste is checked and national wealth is conserved. The new cars, upon which are mounted 28 separate alloyed steel containers, are to replace the old glass-bottle method of shipping helium.

The interesting announcement of the discov-

ery of helium gas in the petroliferous gas coming from bores at Roma, Queensland, was made in September. Under the Petroleum Act of Queensland, all helium recovered belongs to the State. Prof. B. D. Steele of the University of Queensland was the first to detect the appearance of helium in a sample of gas from one of the Roma bores. He estimated that it was present to the extent of one in 12,000 parts, or .008 per cent. A sample of gas from another Roma bore, in which oil had also made its appearance, was submitted to Dr. C. Coleridge Farr of the University of New Zealand, who had been making a comprehensive search for this rare element in the natural gases of Australasia. His examination of the sample showed helium equal to one in 2500 parts, or .04 per cent.

NITROGEN. There was a considerable development in the production of nitrogen during the year. The United States *Commerce Reports* in September noted that the world's largest air-nitrogen fixation plant, located about 80 miles south of Berlin, had effected enormous increases in production of fixed nitrogen in ammonium sulphate and calcium nitrate and of its synthetic motor fuel obtained by lignite hydrogenation. Fixed nitrogen production of Leunawerke, at present 1400 tons of nitrogen daily, or over 500,000 tons annually, is to be raised to 1500 tons daily, or another 36,000 tons annually. The German Chemical Trust's other nitrogen-fixation plant, Oppau at Ludwigshafen, accounts for a further 100,000 to 150,000 tons of fixed nitrogen a year. These figures make a total German dye trust production of a maximum of 650,000 tons a year, or easily 80 per cent of the total German production, including the 75,000 tons of fixed nitrogen produced each year by the calcium cyanamide and the coke and gas plant groups.

Earlier in the year, Dr. J. Beub delivered an address on the future of the industry in which he spoke of the satisfactory results obtained in agriculture by the use of the new fertilizers, nitrate of lime and nitrophoska, which the German syndicate had developed. He pointed out the important part which the industry had played in supplying the world's food requirements. Dr. F. G. Cottrell of the U. S. Department of Agriculture appreciating this situation in an address in January pointed out that the fixation of atmospheric nitrogen had reached a point which threatens the dominance of Chile's nitrate deposits in the world's fertilizer market and may oblige the Chilean producers to adjust their plans of production and sales so as to conform with the competitive situation thus brought about. He said:

It is not yet fully appreciated by people closely associated with the fixed nitrogen industry, how fundamental and revolutionary are the changes it has introduced. Chilean nitrate deposits have determined world prices in nitrogen products for nearly a century, because until recently they were the only independent and practically unlimited sources of such compounds. Today the fixed nitrogen industry has overcome difficulties limiting its production to such a degree that the Chilean monopoly is no longer in complete control of world nitrogen prices. Hereafter, Chilean nitrate production will have to follow and adjust itself to world price levels, established by costs in synthetic nitrogen production.

An interesting application of the use of nitrogen was announced in September by T. F. MacGregor who found that fruit picked three weeks

previously and placed in cans from which air had been expelled and nitrogen substituted in an attempt to arrest putrefaction, proved successful.

POTASSIUM. The search for commercial potash supplies being conducted by the Federal Government in Western Texas and East New Mexico led to the preparation of a report by the U. S. Bureau of Mines on the methods and costs of potash mining in Germany and France. Consideration was given to the possible application of similar methods when mining of the American potash deposits is undertaken. Nearly 95 per cent of the world production of commercial potash is derived from the soluble potash-salt deposits of Germany and France. The estimates of German potash reserves vary from 22,000,000,000 to 3,840,000,000,000 short tons of crude salts. The French reserves are estimated at approximately 1,600,000,000 short tons. The recently discovered deep deposits in Texas and New Mexico were believed by competent geologists and engineers to contain many millions of tons of soluble potash salts. They were being extensively prospected by drilling, with a view to developing a source of supply which, with potash derived from Searles Lake and other sources of brine, should render the United States less dependent upon the present Franco-German monopoly.

The Department of the Interior announced in June further discoveries of substantial bodies of potash salts in Texas. The most promising of these was in Ector County, where two beds with a combined thickness of 6 feet 7 inches were encountered a little more than 1900 feet down. In this connection interest likewise attaches to the discovery of potash at Gautreau in New Brunswick which the Federal Department of Mines in Canada considers important. In sinking a well in search of oil, a bed of rock salt 485 feet thick was penetrated and samples embracing the complete salt strata separately tested all showed the presence of potash.

RADIUM. The use of a modified nitric acid method for the recovery of radium from carnotite tailings from which the vanadium has been extracted is suggested in its Serial No. 2873 by the United States Bureau of Mines to prevent the loss of the radium content being wasted in present practice. In this publication issued in June it says:

Present methods of extracting vanadium from carnotite leave the radium as a fine precipitate in the tailings. The water used to flush these tailings away from the plant and the subsequent weathering may easily disperse the radium-bearing slime beyond possibility of recovery; if, however, the tailings are delimed and the slimes dewatered and stored, then the radium will be saved in a concentrated condition suitable for subsequent refining; this can be done at a cost which is an insignificant fraction of the former, and probable future, value of such a concentrate. There is also a limited market for such material in the manufacture of so-called medicinal radio-active preparations, which, though reported of doubtful therapeutic value, might better be made from a discarded tailing than from a virgin ore having a still lower radium content.

A new explosive of which radium is an important ingredient was reported in May from the California Institute of Technology in Pasadena, Calif., to have shown itself to be 30 per cent more powerful than TNT and 15 per cent more effective than commercial dynamite, in official tests. The explosive, which was invented by Capt. H. R. Zimmer of Los Angeles, was

tried out by Lieut.-Col. L. M. Adams, Professor of Military Science. An ounce of each of the three explosives was placed in three separate lead jars, and their comparative power determined by measuring the expansions created by the explosions.

CAST IRON MADE IN AN ELECTRIC FURNACE. An investigation of the making of electric-furnace cast iron has been completed by the U. S. Bureau of Mines in its Northwest Experiment Station in Seattle, Wash., in cooperation with the College of Mines of the University of Washington. The investigation involved a year's operation of a jobbing foundry making miscellaneous gray-iron castings from steel scrap. The results show that electric-furnace cast iron is stronger, tougher, and more dense than cupola iron, and a higher recovery of metal in casting can be obtained as a result of higher pouring temperature. Cast-iron scrap of high sulphur content can be converted into high-grade cast iron, low in sulphur, either by melting directly in the electric furnace or by refining molten metal from the cupola. Large additions of steel scrap may be used if desirable, or steel scrap can be used entirely and synthetic cast iron made. Some of the advantages of the production of synthetic cast iron are that one electric furnace can be used to produce both iron and steel and can thereby be kept in operation during periods when it might otherwise be idle. By operating an electric furnace continuously, labor is kept usefully employed, the heat of the furnace is conserved, life of the refractories is extended, overhead charges are reduced, and a high load factor on the power lines is maintained. Therefore, even under conditions where production of synthetic iron would not of itself be economical, it might be profitable in conjunction with the making of steel, because of the possibility of reducing the cost of producing steel.

ALUMINA CEMENT. Blast furnace slag is now regarded as a satisfactory and economical raw material for making portland cement. An investigation on this subject by the U. S. Bureau of Mines at its North Central Experiment Station in Minneapolis was published as Serial No. 2869 in May. The bureau's experimental 6-ton blast furnace was operated on a charge of bauxite, limestone, iron ore, and cast-iron turnings. During a three weeks' test about 70 tons of high alumina slag were produced and there seemed little doubt as to the feasibility of operating a blast furnace on a charge of bauxite, limestone, and iron ore so as to produce a substantial amount of iron and a slag which falls within range of composition of alumina cements. The iron oxide in slag made in a blast furnace would differ from alumina cements made by simple fusion of raw materials because most of the iron in the bauxite would be reduced to the metallic state in the blast furnace and recovered under proper conditions as low-sulphur metal.

One subject of the experiment, conducted in cooperation with the Aluminum Company of America, was to determine whether the so-called Pedersen process can be applied to the blast furnace. This process consists of smelting a charge of bauxite, iron ore, and limestone and results in two products. One is a slag containing about 50 per cent of oxide of aluminum and is intended for use in manufacturing aluminum, and the other is iron low in sulphur. The successful beneficiation of high-silica bauxites,

a problem under investigation by the Bureau of Mines at its Southern Experiment Station, would make large tonnages of low-grade bauxite available for the manufacture of aluminum as well as alumina cement.

FLUE DUST. The U. S. Bureau of Mines made a study of flue dust, the results of which were published in June as their Serial No. 2871. Essentially detailed information is given concerning what is in smelting operations the finely divided material called "flue dust," which is carried by the moving gases from the roasters and furnaces, then partly settled and recovered in the flue system. The flue dust from copper smelters contains a high percentage of copper, usually some gold and silver, and occasionally other valuable metals. It is too valuable to throw away and in present practice is returned to the smelting furnaces for retreatment. A part of this material again passes out with the gases and forms a circulating dust load in the system. The dust that passes out of the stacks into the atmosphere is an important source of loss in copper smelting. Loss of values also occurs by dust being blown while in transit from the flues back to the furnace, and of course the greater the amount of rehandling the greater this loss. Dust carried in the gas currents causes corrosion of the roof arches in reverberatory furnaces. Returning flue dust to the furnace increases the quantity of suspended dust. Corrosion reduces the life of the arches and shortens the length of furnace campaigns; also the corrosion of arches limits the temperature at which a furnace may be operated. Every ton of material that must be retreated in the furnaces reduces correspondingly the amount of new ore or concentrates that could be smelted.

INDUSTRIAL ALCOHOL. Concerning this important chemical a recent report says:

Alcohol is necessary to any development of chemical industry. The remarkable progress of American chemical industry in the past two decades, output having increased in value more than 75 times, has likewise been facilitated by the growth of industrial alcohol output. Post-war developments in the automotive industry have been of enormous importance to alcohol production, and about one-half of the annual output is devoted to some phase of automobile manufacture or operation. Anti-freeze solution is the largest single use of alcohol, amounting to about 40,000,000 gallons a year. The automobile also has given impetus to alcohol production by reason of the increased use of nitrocellulose lacquer and artificial leather, for both of which alcohol is essential. Five years ago all automobiles were finished with varnish; now more than four-fifths of them are lacquered, and the percentage is growing constantly. Other employments for lacquer which have opened up, following its success as an automobile finish, include its use on furniture, in railroad cars, for interior decoration, on floor coverings, leather, and for other purposes. The post-war development of the manufacture of high-grade perfumes and pharmaceuticals in the United States, indirectly results from the expansion of the alcohol industry.

FUEL. A startling announcement was made at the International Conference on Bituminous Coal held in Pittsburgh, Pa., on November 23, by Dr. Walter Rittman who described a new process by means of which the waste petroleum left after all the gasoline obtainable by cracking has been extracted can be utilized. By heating and running this waste through pipe coils several thousand feet long each 400 tons of waste changes through vapor into 300 tons of oil that is recovered for manufacture of gasoline and into 100 tons of residue that is coal. This coal under analysis is found to be similar to other natural coals. The process differs from those previously

used on petroleum waste, which produced coke instead of coal. The handling of this coke requires considerable labor, but the new gasoline-coal apparatus runs cheaply because it is almost automatic. The coal runs out in such liquid form that it has even been pumped into coal cars, there to harden during transportation. The process is not a laboratory experiment but is already a paying commercial enterprise.

MOTOR FUEL. At a meeting of the American Institute of Chemical Engineers Dr. George G. Brown of the University of Michigan, who for two years had been devoting his time to experiments in the more efficient use of natural-gas gasoline, in a paper summarized the work done by the Natural Gasoline Association as follows:

The use of substantial proportions of natural-gas gasoline with the ordinary gasoline makes the motor start more easily in winter and has an anti-knock value. While most refiners have been blending some of this natural gasoline with their staple gasoline he thought that more could be used with benefit. Specific recommendations have been made concerning the starting and anti-knock values of natural gasoline in motor fuel. There are products in the natural-gas gasoline which, when blended with petroleum gasoline, will cut out the knock and make for quicker starting. The fuel also has peculiar advantages for aviation uses. At the Swampscott meeting of the American Chemical Society, Prof. T. E. Layng of the University of Illinois pointed out that formaldehyde and methanol are the starting points in the production of synthetic resins and plastics found in radio sets, automobiles, countless molded materials, and in many forms of art. Methanol is used in great quantities in many chemical industries and in the manufacture of dye stuffs, paint, and varnish. With alterations in the designs of internal combustion engines methanol may become important as a motor fuel. This new process should become a serious competitor of the German method of synthetically producing methanol or wood alcohol from hydrogen and carbon monoxide, largely on account of the large volumes of natural gas available in the oil fields in the United States.

An announcement with far-reaching possibilities was made at the Second International Conference on Bituminous Coal held in the Carnegie Institute of Technology in Pittsburgh, Pa., on November 9, by Dr. Carl Krauch, of the German Farbenindustrie Aktiengesellschaft concerning the manufacture of synthetic gasoline from coal. (See under *Synthetic Gasoline*, YEAR BOOK for 1927, p. 180.) Doctor Krauch described the commercial success in Germany in making synthetic gasoline from soft coal, and incidentally also making soap from coal. Coal gasoline may be changed in the making at will into the most diverse marketable products, such as kerosene, gas, oil, and lubricating oils, thus making it possible to adapt the process to the fluctuations of the market. If anti-knock gasoline is wanted, German chemists can control their method of transforming molecules of coal so that certain aromatic basic substances affecting knocks are properly synthesized. The result is to put into gasoline a molecular structure that slightly affects the rapidity of explosion. In 1928 there was at the Leuna plant an annual production of 70,000 tons of gasoline, of which 40,000 tons were obtained from coal. It was hoped to raise the production to 250,000 tons at the end of 1929. The gasoline produced found a ready market for the reason that in all essential properties it equaled a good gasoline obtained from crude oil in the ordinary way. Soap was produced because the dye trust found quantities of paraffin from liquid coal on its hands, with a paraffin market relatively small. Dr. Krauch learned how to overcome the difficulties of extracting from paraffin

fatty acids that make soap. One of these steps enabled the chemists to complete in a few hours processes which formerly required several days. These experiences have led to a belief that the German synthetic gasoline process is analogous to that used by nature deep in the earth to transform peat and coal under heat and hydrogen pressure into natural petroleum deposits.

SYNTHETIC SUGAR. In a wireless dispatch from Geneva came the announcement that Prof. Ame Pictet of Geneva University has discovered a process of producing artificial sugar by synthesis from several substances after years of experiments. His product possesses the qualities of and resembles and tastes like ordinary sugar, such as is obtained from sugar cane or beet root. Artificial sugar will probably never be placed on the commercial market owing to the cost of production. Saccharine is not employed in the process.

GLYCERINE. A newspaper notice reports the beginning of commercially extracting glycerine as a by-product in the distillation of ethyl alcohol. The process is said to make large-scale production of glycerine possible at a cost of only 25 per cent of the present supply which has been produced only as a by-product of soap making. The manufacture of explosives and of anti-freeze solutions for automobiles are the two chief industrial uses of glycerine.

PAPER. In March an announcement was made of the perfection of a process which would make commercially possible the manufacture of newspaper from gumwood and Southern pine, two of the most abundant and rapid growing of Southern woods. In the final tests, made by the Arthur D. Little Corporation, gumwood cut in Mississippi was ground in a Maine pulp mill, mixed with a small amount of Southern pine sulphate pulp, purchased from a Southern mill, and made into paper at a Maine mill. This paper was used by Boston and New Orleans newspapers in running off regular editions on their high speed presses and gave satisfactory results.

DURABLE CLOTH. The intricate processes of plant life which have mystified science for many years were partially solved by experiments at the University of California carried on by Professors O. L. Sponsler and W. H. Dore, which seemed to reveal the chemical changes which take place in the conversion of cotton fibre into mercerized silk. The tremendous strength of cellulose fibre, of which the glucose molecule is the essence, makes it a highly important agency in the hands of the manufacturer who has been able to employ it in many useful ways without knowing its chemical composition. This secret would provide mankind with the means of manufacturing products of a high degree of utilitarian value. One of the numerous possibilities which may result to the benefit of industry from this research was a cloth of a durability and strength comparable with a network of steel cable.

NECROLOGY. Conspicuous among American chemists who died during 1928 were Theodore William Richards who died in Cambridge, Mass., on April 2, who had received the Nobel Prize in 1915 for his great work on determining the atomic weights of elements; and Edgar Fahs Smith who died in Philadelphia, Pa., on May 3, and who was known as "the best beloved college professor in America." Both Richards and Smith were members of the National Acad-

emy of Sciences and past presidents of the American Chemical Society. Biographical notes will be found under the appropriate heads.

BIBLIOGRAPHY. Among the more important books on chemistry that were published during the year are the third part of volume iv of the *Handbuch der anorganischen chemie*, by Richard W. H. Abegg; volume vi of the fifth edition of Allen's *Commercial Organic Analysis*; volume xi of the fourth edition and the first supplement of Beilstein's *Handbuch der organischen chemie*; a second edition of *A Textbook of Organic Chemistry*, by Joseph S. Chamberlain; a third edition of *The Determination of Hydrogen Ions*, by William M. Clark; the fifth edition in three volumes of *Organic Chemistry for Advanced Students*, by Julius B. Cohen; part 1 of volume vi, parts 1 and 3 of volume vii, parts 1 and 2 of volume ix, and volume x of *A Text Book of Inorganic Chemistry*, by J. Newton Friend; volume i of the third edition of *Die ätherischen öle*, by E. Gildemeister; the fourth edition of the *Chemical Encyclopædia*, by Charles T. Kingzett; the eighth volume of *A Comprehensive Treatise on Inorganic and Theoretical Chemistry*, by Joseph W. Mellor; the fourth volume of *International Critical Tables*, issued by the National Research Council; the second volume of *Solubilities of Inorganic and Organic Compounds*, by Atherton Seidell; and the first volume of *A Chemical Patents Index of the United States, 1915-1924*, by Edward C. Worden.

CHESAPEAKE AND OHIO CANAL. ANNIVERSARY. See CELEBRATIONS.

CHESS. Dr. Alexander Alekhine of Paris, the world chess champion, exercising his prerogative, did not defend his title in 1928 but was expected in 1929 to face either José R. Capablanca, of Cuba, from whom he wrested the crown in 1927, or E. D. Bogoljubow, of Freiberg, Germany, both having issued challenges. Capablanca was the most active of the chess masters during 1928, taking part in three international tournaments. He won first place both at Budapest and Berlin and finished second at Bad Kissingen. Hungary captured first honors in the Olympic competitions, with the United States second. Seventeen countries participated. The best individual showing was made by I. Kashdan of the Manhattan Chess Club, New York City, who accumulated 13 points in 15 games for a percentage of 86.66. The amateur Olympic honors went to Dr. Max Euwe of Amsterdam, Holland.

Abraham Kupchik won the second annual tournament of the National Chess Federation held at Bradley Beach, N. J. The Manhattan Chess Club captured the championship of the Metropolitan Chess League for the third year in succession. Harvard was the victor in the H. Y. P. W. College Chess League, while New York University triumphed in the Intercollegiate Chess League.

CHICAGO, UNIVERSITY OF. An institution of higher education situated on the Midway Plaisance of the Chicago South Park System, Chicago, Ill., founded in 1890, largely through gifts of John D. Rockefeller. The University, with its affiliated institutions, occupies for educational purposes, over 65 buildings and 196 acres of land, including the site of the Yerkes Observatory at Williams Bay, Wisconsin. The net total regis-

tration for the autumn quarter of 1928, exclusive of the home-study department, was 8108, distributed as follows: Graduate school of arts, literature, and science, 1425; under-graduate school of arts, literature, and science, 2855; divinity school, 297; medical courses, 203; Rush Medical College, 304; law school, 376; college of education, 65; school of commerce and administration, 239; graduate school of social service administration, 130; graduate school of library science, 10; and university college, 2528. The summer quarter enrollment for 1928 was 6342. For the year 1927-28 there were 755 faculty members above the rank of assistant.

The total productive endowment of the University as of June 30, 1928, was approximately \$43,400,000, and its total resources, including funds held as agent and funds held temporarily, were in excess of \$77,800,000. The library contained approximately 800,000 bound volumes and about 400,000 unbound volumes and pamphlets.

Among the larger gifts received during the fiscal year ending July, 1928, were the following: From Julius Rosenwald, \$250,000 for the use of the departments of physics, mathematics, and astronomy; also \$250,000 to be subscribed by the University to the building fund of the Chicago Lying-in Hospital and Dispensary for the purposes of assisting the hospital to carry out the obligations assumed by it under the terms of a contract in which the Hospital agreed to construct a new hospital building or buildings near the university. Mr. Rosenwald also gave \$5000 in memory of Dr. Thomas Wakefield Goodspeed, the income to be used for incidental expenses of the department of the New Testament. From Max Epstein the university received \$100,000 for the building fund of the Chicago Lying-in Hospital and Dispensary for the purpose of establishing within the building or buildings an out-patient department of the hospital near the university. Bernard A. Eckhart subscribed a sum to be applied toward the cost of erecting and equipping a building for the use of the departments of physics, mathematics, and astronomy; Bernard E. Sunny gave a sum to be added to that which he had previously given to the university, the total to be used for the construction of a gymnasium for the laboratory schools of the school of education. The university received from Robert Law, Jr., an increased subscription to the Development Fund of from \$80,000 to \$200,000, the total to be used as endowment of a Distinguished Service Professorship. From Mr. and Mrs. Albert D. Lasker came a gift of \$1,000,000 as endowment of a programme for medical research into the causes, nature, prevention, and cure of degenerative diseases common to middle age.

Grants were also received from 12 separate sources for the promotion of research projects, totaling \$62,140. John D. Rockefeller, Jr., made a pledge of \$15,000 a year for five years for the expenses of the Oriental Institute and James A. and Henry J. Patten contributed \$5500 for its work. Mr. and Mrs. William J. Chalmers established a trust fund of \$15,000 for a memorial to be known as the "Frank Billings Fellowship in Medicine from William J. Chalmers and Joan Chalmers." A pledge of \$50,000 was received for the purpose of establishing the Leila Houghteling Fellowship and Scholarship Fund in the school of social service administration. Friends of the late Louise Roth pledged the

sum of \$4000 for an undergraduate scholarship in her memory. Among the bequests received by the University were the following: Anna L. Van Benschoten, \$2000; Edward L. Ryerson, \$50,000; Andrew MacLeish, \$10,000; and Charles H. Viol, \$5000. The following gifts were received for the purposes of general endowment: J. J. Dau, \$50,000, and Edward F. Swift, \$25,000. Up to July 1, 1928, the University had received contributions totaling \$401,923 to the Frank Billings Medical Endowment Fund, which it aims to raise to \$1,000,000. For the promotion of welfare work among foreign students the total sum of \$20,250 was received. A pledge was received from Harold F. McCormick to pay \$5,000 per year for three years toward the support of the school of social service administration, and Mrs. Anita M. Blaine pledged \$500 a year for three years for the same purpose. August F. Peabody and Charles P. Bullen each gave \$5000 toward the support of research in the humanities.

Buildings under construction during the year 1927-28 involved the expenditure of about \$2,500,000, most of which was devoted to completing buildings begun in the year 1926-27. Progress was made during 1928 on the George Herbert Jones Chemical Laboratory, the final cost of which was estimated at \$704,000; construction of a new power plant was started, estimated to cost about \$1,260,000, when completed; and ground was broken for the social science building and the Bobs Roberts Memorial Hospital for Children. The estimated cost of the social science building was \$665,000 and of the Bobs Roberts Memorial Hospital for Children, \$500,000. Plans were formulated for the construction of the following buildings: Bernard E. Sunny Gymnasium, estimated cost, \$500,000; the Nancy Adele McElwee Memorial Hospital, estimated cost \$300,000; the Gertrude Dunn Hicks Hospital, \$300,000; Bernard E. Eckhart Laboratory for physics and mathematics, estimated cost, \$700,000; and the botany laboratory and green houses, about \$300,000. Acting president of the university, Frederic Woodward, A.M.

CHILD LABOR. While only 10 State legislatures in the United States met during 1928, legislation favorable to children in industry was passed in all but three. The act passed by Congress amending extensively the *District of Columbia* child labor code is reviewed below. In *New York* the administrative machinery attending compulsory school attendance and the issuance of employment certificates was simplified. Attendance in continuation school was fixed at the age of 17 instead of 18 as heretofore.

Rhode Island's legislature added the following provisions to the State's child labor law: hours for work for persons under 16 were reduced to 9 hours a day and 48 hours a week; night work was prohibited after 7 P.M.; the street trades law was made to apply to the children of Pawtucket and Woonsocket as well as to Providence. *New Jersey* raised the educational requirement for work permits from the completion of the fifth grade to the sixth. It is interesting to note in this connection that only 22 States in 1928 had a requirement of less than the completion of the sixth grade. In *Kentucky* a law was passed strengthening the enforcement provisions of the compulsory school attendance law. The two houses of the *South Carolina* Legislature passed

laws extending compulsory school attendance to the ages of 7 to 14; increased the period of attendance to the full term of six months; raised the penalties for violation and passed an appropriation measure for the payment of salaries for attendance officers. However, the poverty exemption was lowered from 12 years to 10 years. The governor vetoed the appropriation bill and delayed approving the remainder.

In *Virginia* a school code was adopted raising the period of compulsory school attendance to the ages 7 to 15. Enforcement of the law was placed in the hands of juvenile and domestic relations courts where they existed, and all those children not attending school might be proceeded against as neglected children. In *Louisiana* and *Mississippi* no legislation was enacted; while in *Massachusetts* there was killed in the lower house a bill calling for the raising from 14 to 16 years of the entrance age into factories, mercantile establishments, etc., and the fixing of 18 years for the entrance age into certain dangerous occupations. The bill was defeated largely because it made no provision for vacation work, etc.

It may be well at this point, before proceeding to the more specific notes, to point out generally the status of child labor in the United States in 1928. Every State in the Union had fixed 14 years as the minimum age for entrance into industry. In 30 States a child must have completed if it is under 16, at least the sixth grade; in 20 the full elementary course is set as the minimum. Almost all States prohibit night work; four States set a 44-hour week for children, most fix the hours of work per week at 48, but two States allow a 60-hour week.

Quantitatively, there had been a drop in the number of children gainfully employed in non-agricultural activities. In 1900, 686,213 children between the ages of 10 and 16 were being employed or 7.1 per cent of all the children in this age group; in 1920, the figure was 413,549 or 3.3 per cent of all the children in the age group 10 to 16.

ACCIDENTS TO CHILDREN. The *Ohio* State Industrial Commission for the first time in 1928, under the powers granted it by the 1924 State constitutional amendment, placed penalties on an employer because a minor working for him and illegally employed was the victim of an accident. The *Illinois* Bureau of Labor Statistics published an important analysis of the records of 1803 children who had met with accidents while employed prior to the passage of the State's amendment to the workmen's compensation act affecting the status of children illegally employed (1927). A follow-up of these cases indicated that in only five instances had settlements been made under damage suits. The report points out that such cases had been exempted from the workmen's compensation act in order to expose employers to suits at law, with possible heavier penalties.

CALIFORNIA. By order of the Department of Industrial Relations, children under the age of 16 were excluded from work in the following occupations: all trades where they might come into proximity to moving machinery; building and construction; delivering goods from motor vehicles. The order was based on the fact that in the fiscal year ending June 30, 1927, 402 accidents had happened to children under 16, of which 7 had proved fatal, 8 had caused permanent partial disability, and 387 had caused

temporary disability. In the same period a total of 1713 accidents had occurred to children under 18 years.

WISCONSIN. By Wisconsin law, illegal employment for minors is due to the hiring of children under the age of 17 without permit or their employment in an enumerated list of hazardous industries. In the event of accident to minors thus illegally employed without permit, double compensation is levied on the employer; the compensation is treble when the accident is suffered in a prohibited industry. The employer himself must pay the extra compensation and cannot insure against the risk. Since 1923 (through 1927) there had been 324 cases in which extra compensation was paid. In 1927 two-thirds of these involved double compensation for accidents to children employed without the necessary permits. The figures are for the four years: 1923—69 cases, \$9782 normal indemnity, \$29,422 total indemnity paid; 1924—87 cases, \$15,214 normal indemnity, \$55,819 total indemnity paid; 1925—57 cases, \$5806 normal indemnity, \$17,402 total indemnity paid; 1926—66 cases, \$12,830 normal indemnity, \$35,273 total indemnity paid; 1927—45 cases, \$11,111 normal indemnity, \$27,223 total indemnity paid.

PENNSYLVANIA. This State, unlike Wisconsin for example, excludes from the benefits of its workmen's compensation acts all minors who have been illegally employed. A study made of the total number of minors under 18 who had been injured in 1927, showed that of the 4186 industrial accidents to these minors in 515 cases some form of illegal employment was indicated. Further inquiry elicited the fact that illegal employment had been the case in the accidents of 258, or 6 per cent of all the accidents reported for the year 1927. These were the disposition of the 258 cases: 97 were noncompensable because the loss of time was less than 10 days; in 146 cases compensation was paid by the insurance companies, though by law they were not compelled to do so; in 14 cases compensation was refused. Of the 14 involved in this last category, all but 4 were under 16 years of age. In the cases of four the injuries resulted in permanent disability. It is significant to note that whereas Wisconsin awarded double damages to minors illegally employed, in Pennsylvania 90 per cent of those injured received merely the compensation that would have been theirs had their employment been legal. There appears to have been no rule used for the refusal of compensation by the insurance companies in the number thus cited, or compensation appears to have been paid in a number of cases similar in every particular to those rejected. It is interesting to see that only one family refused the offer of an insurance company for a financial settlement.

DISTRICT OF COLUMBIA. The District of Columbia child labor law of 1908 was amended for the first time in the spring and the new bill received the approval of the President on May 29, 1928. Its chief provisions are the following: All children under 14 may not be employed in gainful occupations. Minors under 16 are prohibited from working in the following: industries where machines are operated, as an acrobat, gymnast, etc., in the stuffing of newspapers, as a beggar, street singer, or musician. Minors under 18 may not work at the following: operating

freight or passenger elevators, in a quarry or tunnel, in a tobacco warehouse or cigar factory. Girls under 18 may not work at the following: in a retail cigar store, in a hotel or for an apartment house, as an usher or an attendant in a theatre, as a messenger. The hours of work for minors under 18 may not be more than 48 hours a week nor more than 8 hours in any day. Night work is prohibited for girls under 18 and boys under 16 between 7 P.M. and 7 A.M.; for boys between 16 and 18, the prohibited hours are between 10 P.M. and 6 A.M. Work permits, to be distributed by the director of the department of school attendance to all children under 18, are to be granted when the following have been filed: a signed statement from the prospective employer as to the nature of the work, hours, etc., a certificate of age satisfactory to the director, a certificate of physical fitness if the minor is under 16, a school record for all children under 16 certifying to their ability to read and write English and to their completion of the eighth grade. Employers must secure work permits for all minors between the ages of 14 and 18 and return these to the department. Penalties of fines and imprisonment are established for employers and parents and guardians. The act provides for the appointment of inspectors and gives the juvenile court of the District jurisdiction in cases arising out of violation of the act. It is significant to note that the act does not provide for extra compensation penalties for employers in the cases of accidents to minors illegally employed.

SCHOOL ATTENDANCE IN INDIANA. A study made by the National Child Labor Committee of the workings of the school attendance law in nine cities in Indiana found general observance of the statute. In Indiana children under 14 who have not completed the eighth grade and who are not in possession of an employment certificate may not leave school for work. Only those 16 and over need not comply with the regulations. The study found that 82.3 per cent of the children between the ages of 14 and 17 inclusive were attending school while two-thirds of the children aged 16 and 17 (those not liable under the compulsory attendance law) were attending school. The report attributed this state of affairs to the following conditions: the law was a reasonable one; the law was being enforced by zealous officials; the parents were convinced that their children belonged in school until the age of 16; the excellence of the school system in the State. One of the problems being handled with intelligence is the situation of the backward child. Interestingly enough, the Committee did not find the child labor law being enforced with the same diligence that characterized the handling of the compulsory attendance law.

LABOR'S PROGRAMME. The YEAR BOOK has printed the programmes of American welfare organizations on the question of child labor and much space has been given to legislative enactments. There follows a manifesto adopted by a group of radical European organizations so that the American reader may be in a position to compare European labor's attitude with prevailing liberal sentiment in the United States. This programme was adopted early in the year by the International Federation of Trade Unions, Labor and Socialist International and the Socialist Youth International.

1. Prohibition of all wage-earning work for children up to the completion of the fourteenth year.
2. Compulsory attendance at an elementary school until admission to wage-earning work.
3. Introduction of compulsory instruction (vocational) until the completion of the eighteenth year.
4. The extension up to the completion of the eighteenth year of protective legislation applicable to apprentices and young workers (manual and non-manual).
5. Establishment of a maximum 48-hour week, to include vocational instruction and the time required for clearing up.
6. A free Saturday half-day and a free Sunday; if not Saturday, some other free half-day to be given during the week.
7. Prohibition of night work for young workers.
8. A minimum three weeks of paid holiday for wage-earning young persons under 16 (inclusive of apprentices), and two weeks' paid holiday for wage-earning young persons between 16 and 18 (inclusive of apprentices).
9. Regulations providing for the welfare, unemployment relief, and training of unemployed young workers.

See CHILD WELFARE below.

CHILD NUTRITION. See FOOD AND NUTRITION.

CHILD WELFARE. During the year the list of States carrying mothers' assistance acts on their statute books was increased to 44 by the addition of Kentucky and Mississippi. The Kentucky law authorized the counties of the State to make the necessary allowances, set up a children's bureau and appropriated \$5000 for the latter's upkeep. The Mississippi law, too, authorized the use of county funds for the support of mothers with dependent children, empowered the chancery court to order the payment of these funds and placed under the supervision of the court the investigations of applications for assistance and the necessary follow-up. As a result of this action, the only States that did not provide measures for the assistance of mothers were Alabama, Georgia, New Mexico, and South Carolina. In Georgia, mothers' aids grants were being made by private philanthropic agencies. The Tuttle-Newton Home of Augusta had 71 children under supervision in their own homes; the Hebrew Orphans' Home of Atlanta used the same method and in one month accepted only a single child for institutional care as against 32 for placement in their own homes; the Masonic Orphans' Home of Macon, a recent convert to this method, cared for 34 children of 12 families in their own homes. The field worker of this last institution reported that the cost of children in their own homes was \$5.80 monthly as against a monthly average of \$23.79 for institutional care. Miss Emma O. Lundberg of the Federal Children's Bureau was authority for the statement that at any one time there were as many as 200,000 children being assisted in their own homes as a result of mothers' assistance acts.

New York City was found to be spending \$5,150,436 annually on this work. The number of families receiving aid in New York City on Jan. 1, 1927 was 9907 and the number of children thus taken care of was 26,096. New York State was spending annually \$6,396,307 to keep 34,156 children with their own families. The number of families thus preserved was 12,538. Outside of New York City, mothers' aid is administered by the counties. Erie County, in which the city of Buffalo is located, spent \$265,389 on the care of 414 families with 1357 children. The same report (by the Children's Bureau) pointed out that there were as many as 400,000 dependent children in the country, and that the easiest and most successful method

devised for their care was their retention in their own homes with a sufficient subsidy, however, to permit the maintenance of an adequate standard of living. An inquiry made in 1918 among 12,000 families in 100 cities established the fact that a mother with three dependent children needed \$1000 annually. The Children's Bureau found, however, that this standard was possible in only a few of the States. For example, in 35 States at the beginning of 1928 the maximum expenditure permitted was about \$800 annually and in 20 of the States the sum allowed for the same family unit, i.e., a mother and three children, was \$480.

In another study made by the same authority of the effects of mothers' aid acts, it was found that such assistance rather than breeding a sense of dependency had the contrary result. The places surveyed included the cities of Chicago, Pittsburgh, Detroit, Buffalo, Cincinnati, Seattle, San Francisco, Reading, Pa., New Bedford, Mass., and the city of Winnipeg in Manitoba, Canada. The average monthly grant per family in the 10 localities ranged from a minimum of \$20 a month in Seattle to a maximum of \$51.81 in Buffalo and \$57.40 in Manitoba, Canada. Five of the agencies provided for physical examinations for the children under care though mental examinations were not given the weight needed by public child-care workers. All the 10 agencies paid particular attention to the observance of school-attendance and child-labor laws, and most of the agencies were interested in obtaining further education for children of unusual ability. In five of the ten agencies intensive case work was being attempted. The reports' observations on this point are worth recording: "Even in communities where all-around intensive social case work was not attempted, the regularity of financial aid and its continuance over a period of years, together with such friendly service as was given, fostered an *esprit de corps*, a sense of security and stability, and tended to develop and maintain in a large number of families a high degree of personal efficiency and a capacity to organize their own normal activities on a par with those of the self-supporting families in their communities."

INFANT MORTALITY. During the year 1927 the infant mortality rate in the United States was the lowest on record. For the 683 cities in the birth-registration area the rate was 64.9 per 1000 live births as compared with the 1926 rate of 73.7. Among the cities of over a quarter of a million population Seattle had the lowest rate with 41 deaths and New Orleans had the highest with 88. The combined rate for the cities of a population of a quarter of a million or more was 63.1, while that for the smallest cities, ranging between 10,000 and 25,000 population, was 68.2. Against the ever-declining infant mortality rate was to be placed the stationary maternity mortality rate. For example, a study of maternal deaths in New York State for the periods 1916-20 and 1920-25 shows no decrease in the death rate from puerperal causes. The fact is, in New York City the rate had increased 2 per cent over the later period. Similarly, the figures for still births showed little changes in the two five-year periods. An interesting fact brought out by the study was that the risk of a still-birth was directly related to the total number of children born to the mother, being least for a second child and increasing with each

birth to a maximum among mothers with 12 or more children.

ACCIDENTS. The National Safety Council, in a study published of the fatal accidents that occurred in 1925, revealed that nearly 22 per cent of the more than 90,000 accidents had befallen children 14 years of age and under; and that half of these had taken place in the case of children under 5 years. In the age group under 5 years the most important cause of death had been burns; in the group 5-9 years the most important causes had been automobile accidents and burns; in the age group 10-15 the leading cause was wounds from firearms (15 per cent of the total in this group).

JUVENILE DELINQUENCY. During the year the Chicago police made an interesting and original attempt to cope with juvenile delinquency through the establishment of employment bureaus for boys in the city hall and the local police stations. The theory underlying the creation of these exchanges was that boys employed in interesting jobs will keep out of mischief. The offices were first opened in September, 1927, and from then until the end of the year 5398 applications had been received and a total of 2779 boys had been placed. A follow-up system is part of the bureau and dismissals of boys are investigated.

RECREATION. A survey, made in 1927 and published in February of this year, of recreational activities and facilities for boys in Newark, N. J., showed plainly the need for a wholesale increase in facilities as well as an integrated programme for the guidance of such activities. The study was based upon data furnished by 27,586 boys between the ages of 8 and 17. The completeness of the survey is indicated by the fact that the boys examined included 85 per cent of the total registrants in the age groups employed in the public schools, and 50 per cent of those in the parochial schools. The following chief findings are of significance: the great majority of the boys sought their recreation on the city streets; only 20 per cent of the boys had any affiliation with a church or club conducted by a social agency; one boy out of every nine belonged to a street gang; moving picture theatres furnished the leading commercial amusement. Among the recommendations carried by the report were requests for the extension of continuation schools to include boys of 14 and 15 years, vocational guidance and better opportunities for recreation. The survey was conducted under the auspices of the Newark Rotary Club.

FAMILY ALLOWANCES. Mention has been made in previous YEAR BOOKS of the family endowments being granted to industrial workers on the basis of the number of children being supported. It has been pointed out that the Australian states and France have been the leaders in legislation of this type. Belgium in April, 1928, enacted a law making it compulsory for all contractors performing work for the state, the provinces, or the communes to contribute to a compensation fund for the same purpose. Under the provisions of the compensation fund all children under 14 are to receive allowances, 15 francs being paid monthly to the first child, 20 francs to the second child, 40 francs to the third child, and 80 francs for each subsequent child. In France, such allowance funds have been in operation for eight years and there exists a

general congress which meets annually to report on the progress of the funds. At the congress held in May it was disclosed that there were in existence in the country 218 funds representing 20,000 different establishments and employing 1,500,000 workers. Over the year 1927 these funds distributed in family allowances 260,000,000 francs. If governmental offices and private industries having their own systems are to be included, the total amount distributed was 1,475,000,000 francs among 3,862,000 persons.

FOREIGN NOTES. In January it was reported that the Governor of the State of Puebla, *Mexico*, had ordered the drafting of legislation providing for the creation of juvenile courts in the State. The judge, when appointed, was to be assisted by two teachers, who were to be normal-school graduates, as well as a physician. In Mexico City such a juvenile court had been in operation for upward of a year. In Jerusalem, *Palestine*, an ordinance was enacted forbidding the employment of women and children in the following industries: where the use of white lead is imperative, and making of mirrors, and the manufacture of asphalt and bitumen. *Portugal* was reported to have radically amended its labor code with respect to the employment of women and children in industry. No boy under 16 nor girl under 18 may obtain employment without a physician's certificate and proof of ability to read and write. The minimum age is fixed at 12, children between 12 and 14 may not work more than 6 hours daily, while a working day of 7 hours is fixed for children between 14 and 16. Children under 16 and women may not be employed in work underground or at night work. Employment during the first four weeks after confinement is prohibited; shops employing more than 50 women are to furnish day-nursery facilities. No reduction of wages may be made because of necessity for conforming with the law. *Chile* by a recent decree made school attendance compulsory from the ages of 7 to 15. Previously attendance at school had been required for a minimum of four years only. Among other sections of the decree were to be found the following: All schools, wherever possible, are to be equipped with gardens, workshops, playgrounds, gymnasiums, baths, and libraries; dependent and handicapped children are to be housed in institutions of the cottage type; factories are forbidden to employ children of school age while schools are in session; penalties are provided for parents who fail to send their children to school in conformity with the law.

An interesting form of children's activity has appeared in *Germany* in the mass "hike" in which large numbers participate. The sport has become an organized activity with permanent associations, overnight shelters, programmes, etc. At the end of 1926 there were 2300 shelters scattered throughout Germany for the purpose of taking care of these young *Wandervoegel* or wandering birds. In 1926 a total of 2,100,000 hikers was accommodated. The parent association, the German Association for Shelters for Young People, reported the existence of 900 district groups. For Fifth Pan American Child Welfare Congress see PAN AMERICANISM.

CHILE, ché'la. A South American republic lying on the western Pacific coast of the southern part of the continent, extending from Peru to the southernmost point. Capital, Santiago.

AREA AND POPULATION. The extreme length of Chile is 2628 miles and the average width is 177 miles; area 290,084 square miles. At the census of 1920 the population was 3,753,799. The republic is divided into 23 provinces, subdivided into 82 departments and one territory (Magallanes). The populations of the principal cities, according to the census of 1920 with 1927 estimates in parentheses were: Santiago, 507,296 (587,875); Valparaíso, 182,242 (191,750); Concepción, 64,074 (68,155); Antofagasta, 51,531 (60,331); Iquique, 37,421 (36,200); Talca, 36,079 (35,152). The urban population made up 46.6 per cent of the total. The great majority of the population is of European descent. In 1920 the foreigners numbered 115,763, as against 134,524 in 1917. The natives comprise the Fuegians, for the most part nomadic and living in the southern territories; the Changos, civilized and employed as laborers, in the coast region; and the Araucans, who live in the valleys and on the western slopes of the Andes and number about 101,118. The movement of population in 1926 was: Births, 159,540; deaths, 108,223; marriages, 30,314. The population was estimated in 1928 at 4,024,938. Immigration is small but is encouraged by the Government.

EDUCATION. Primary instruction is free and compulsory. According to the latest available statistics there were 3357 public schools with 438,781 pupils and 9414 teachers. There were also 459 private primary schools with 1430 teachers and 62,099 pupils; 15 public normal schools with 2507 pupils and 453 teachers; 96 public and 102 private secondary schools with 40,084 and 20,536 pupils and 2038 and 1247 teachers, respectively; 11 public commercial schools with 181 teachers and 3133 pupils. There are various schools of mines, professional schools, and other special institutions. For higher education there are the University of Chile belonging to the State, the Catholic University, and two industrial universities, situated at Valparaíso and Concepción. Other noteworthy institutions are the Pedagogical Institute, the National Conservatory of Music, the National Observatory, etc. There are in addition various lyceums and colleges maintained in the provinces.

PRODUCTION, MINERALS, ETC. Although agricultural activities are of vital importance to a considerable part of the Chilean population, in surveying the economic structure of Chile as a world market, it is the mineral resources which are of major interest, accounting for the greater part of its exports as well as furnishing the funds for most of its imports. Prior to and during the World War, Chile enjoyed an unassailable economic position because of its monopoly of natural nitrates, used principally as fertilizer and in the making of munitions, as well as because of the high war-time prices prevailing for copper. Prices of nitrate, together with those for iodine, a by-product of the nitrate industry, were fixed by an international association of nitrate producers, this policy being followed until April, 1927, when free sales were adopted. This step was necessitated by increasing competition from synthetic fertilizers, the production of which has been increasing steadily since the war. Free sales on a competitive basis have brought about some renewal of activity in the nitrate industry which suffered a serious depression during 1926. Although the manufacturing industries are being developed as rapidly as

possible in Chile with the encouragement of a strongly nationalistic government, the nitrate industry remains by far the most important in the economic life of the country.

The agricultural zone lies in the centre of the country, the climate permitting the raising of tropical products as well as those of the temperate zone. Cereals are the leading crops and wheat is the most important. The acreage and production in metric quintals of the principal crops in 1926-27 were as follows: Wheat, 1,459,104 acres, 19,675,142 quintals; barley, 134,138 acres, 2,265,028 quintals; oats, 94,440 acres, 1,201,652 quintals; maize, 56,798 acres, 880,736 quintals; beans, 91,977 acres, 1,211,740 quintals; peas, 25,322 acres, 233,548 quintals; potatoes, 67,020 acres, 323,177 tons; vines, 170,152 acres, 68,774,560 gallons of wine. The area planted in tobacco was 2221 hectares and the production, 4,152,000 kilos. Fruit growing has latterly increased and covers an area of approximately 20,000 hectares. On Jan. 1, 1926, the livestock comprised 323,581 horses, 27,364 asses, 40,187 mules, 1,918,433 cattle, 4,093,872 sheep, 357,033 goats, and 246,636 pigs. In 1927 there were 9093 industrial establishments and 58,714 commercial establishments.

Chile is very richly endowed with minerals, being the second largest producer of copper in the world. Other important minerals are gold, silver, cobalt, manganese, coal, nitrate, borate, salt, sulphur, and iron ore. As stated above the nitrate industry is the most important in Chile, although it has been slipping in recent years due to synthetic fertilizer manufactures. Some idea of the extent to which this industry has slipped may be gathered from the fact that in 1910, 64 per cent of the world's consumption of inorganic fertilizers was contributed by Chilean producers, whereas in 1926 they supplied only 25.7 per cent of the demand. The year 1927 opened with only 25 nitrate *oficinas* in operation, employing 22,847 men and producing 79,551 metric tons in January. The industry steadily increased its production during the year, and by June 30, 34 plants were operating, employing 31,119 workmen and producing 118,461 tons of nitrate during the month. By December, 1927, 62 plants, employing 54,286 men, were producing 233,848 metric tons. Thus the downward trends which prevailed during 1926, when plants were closing down uninterruptedly, were reversed during 1927, but, taking the year as a whole, production during 1927 amounted to 1,615,111 metric tons, a decrease from the previous year, when it totaled 2,016,000 tons. However, exports of nitrate, which in 1926 amounted to only 1,668,169 metric tons, increased to 2,375,441 tons in 1927, thereby lessening accumulated stocks, and, though the close of 1926 saw the nitrate industry at a low ebb, 1927 was a year of slow but steady recovery, with additional plants preparing to renew operations. The production in 1928 was 2,295,613 metric tons and the exportation 2,755,013 metric tons.

COMMERCE. The total value of exports in 1926, the last period for which full statistics were available, amounted to \$199,794,000. The principal exports were nitrate (1,668,000 metric tons valued at \$86,447,000); copper (187,23,000 kilos valued at \$22,968,000); and iodine (1,132,000 kilos valued at \$11,573,000). The imports were valued at \$156,155,000, of which 32.6 per cent came from the United States, 17.3 per

cent from the United Kingdom, 12.1 per cent from Germany, and 4.2 per cent from France. Preliminary figures for 1927 give imports of \$129,510,000 and exports of \$203,940,000.

Total exports from the United States to Chile were valued at \$37,888,715 in 1927 as against \$49,043,193 in 1926. However, in 1926 Chile purchased a number of items, such as locomotives and equipment used in the electrification of the Trans-Andean Railway, construction materials and plan equipment for a large American nitrate *oficina* using a new process, and equipment for a new copper smelter, which constitute capital expenditures and are an abnormal item in trade. United States exports to Chile in 1925 were only \$30,274,000. Hence the 1927 figures represent merely a \$2,000,000 decline from those of a normal year, and this drop may be attributed to unfavorable economic conditions during 1927.

United States imports from Chile, which consist principally of nitrate and copper, decreased from \$81,442,281 in 1926 to \$61,857,438 in 1927. Imports of sodium nitrate, the Chilean product, into the United States during 1927 amounted to only \$30,132,158, as compared with \$42,781,386 during the previous year. This decrease was largely attributed to the poor cotton year in the United States in 1926, which affected the import of fertilizers in 1927. Imports of refined copper from Chile declined from \$22,884,487 in 1926 to \$12,785,696 in 1927, although imports of unrefined copper in pigs and bars rose from \$4,170,341 in 1926 to \$7,523,510 in 1927. These two items alone very nearly account for the decline in imports from Chile in 1927.

FINANCE. The ordinary budget of Chile for 1928, as promulgated by the President on Jan. 5, 1928, calculates receipts and expenditures at 959,100,000 and 942,600,000 pesos, respectively, thus anticipating a surplus of 16,500,000 pesos. It was estimated that the income derived from the various sources would be as follows:

	Pesos
National properties	7,650,000
National services	99,078,860
Direct and indirect taxation:	
Imports	240,000,000
Exports of nitrate	219,000,000
Income	155,000,000
Other	161,300,000
Total	775,300,000
Various receipts	77,090,757
Total ordinary revenues	959,119,617

The estimates of income appeared to be conservative and might prove to be appreciably below that actually received. Expenditures authorized in the ordinary budget for 1928 were 12,900,000 pesos below the total authorized in the 1927 ordinary budget. Itemized expenditures to be made during 1928 were as follows:

	Pesos
Presidency of the Republic	861,240
Independent services:	
Comptroller general	2,000,000
Bureau of supplies of the State	400,000
Congress	6,751,082
Interior	120,497,743
Foreign relations	11,727,220
Treasury	34,182,397
Public education	130,003,072
Justice	28,550,855
War	106,160,000

	Pesos
Navy	102,958,424
Fomento	17,800,000
Social welfare	33,775,000

Total administrative expenditures .. 590,667,034

Service of public debt	231,753,773
General contributions and special funds ..	51,967,900
Social protection	66,300,000
Return of imposts and taxes	2,000,000

Total ordinary expenditures 942,688,707

In addition, an investment of 200,000,000 pesos during 1928, and a total of 1,575,000,000 within a period of six years, in the development and construction of public works was the ambitious programme of the Chilean Executive, according to the proposed extraordinary budget and plan for public works, submitted to Congress in the early part of January.

For the first time in its recent history of financing, a careful demarcation of revenues and expenditures was being attempted in an ordinary and extraordinary budget. Heretofore, in addition to the ordinary appropriations, extraordinary expenditures had been attended to by separate legislation, each law intended to create its own revenue for the sum to be expended. Frequently, however, exigencies had arisen which made necessary or advisable the setting aside of such moneys thus raised for purposes different from the original intention. The extraordinary budget for 1928 called for expenditures of 242,700,000 pesos for stated objects and 59,800,000 for such other items as may be found necessary or advisable during the course of the year. These expenditures of 302,500,000 pesos were to be met from borrowings.

COMMUNICATIONS. The total length of government-owned railways in Chile in 1927 was 4683 kilometers; capital expenditures, 862,963,000 pesos; receipts, 239,168,000 pesos; expenditures, 197,678,000 pesos; interest payments, 22,704,000 pesos. For the first half of 1928, the total income was 135,000,000 pesos and expenses and charges, 107,000,000 pesos. The total length of all railways in Chile in 1926 was 8620 kilometers. In the same year there were 23,373 kilometers of first-class highways, 16,910 kilometers of telegraph wire, 28,360 telephone instruments in use, and 11,780 automobiles registered (1927). The shipping entered at the ports of Chile in foreign trade in 1926 was 1100 vessels of 3,206,465 tons; cleared, 1044 vessels of 3,001,892 tons.

GOVERNMENT. According to the constitution of Oct. 18, 1925, legislative power is vested in the National Congress, consisting of a senate of 45 members and a house of representatives of 132 members. The executive power is vested in the president who is elected for six years, and who is not eligible to succeed himself. The president is assisted by a cabinet, which is responsible to him, and the members of which may speak in congress but may not vote. President in 1928, Col. Carlos Ibáñez. For Navy see NAVAL PROGRESS.

HISTORY. It was announced on Oct. 10, 1928, by the Secretary of State of the United States that in view of the resumption of diplomatic relations between Chile and Peru and the hopeful prospect that these two countries might be able to settle the long-standing Tacna-Arica dispute which, if settled, would make unnecessary further work of the boundary commission, the two

governments had agreed to suspend the work of the boundary commission for a period of four months in order to give time to permit negotiations between the governments for a settlement. Both governments agreed to accept such a proposal. For a discussion of the Tacna-Arica dispute, see article *ARBITRATION, INTERNATIONAL*.

The government of Col. Carlos Ibáñez passed through a comparatively calm and quiet year. From time to time there were rumors of revolt against his stern methods, but not one of these rumors materialized into any movement threatening his rule. He stated time and again that there was to be no return to the old methods of government that had been in existence before his régime and that any person suspected of being disloyal to his government would be ruthlessly punished, particularly if such persons held government positions.

Among the various laws enacted or decreed during the year the following might be mentioned: *Tariff law*—A new tariff law, which changed considerably the old rates of import duties, was published on February 27 and went into effect on April 27, except for those items in which there is a reduction in the tax or for those items previously free and now taxed. *Land titles*—A law was passed to regulate the land titles in the south. These lands which were originally held by the Indians or by the State, were in many cases settled long ago without legal titles, having passed since through many hands. The lack of perfect titles had impeded the development of this region, because the holders of the land encountered difficulties in getting mortgage credit. *Government bonds*—All government bonds were exempted from income taxes. They were to be received at par by the National Government for any guarantees. *Insurance department*—An insurance department was created for the supervision of insurance companies doing business in the country and also to provide reinsurance for excess risks. *Industrial Credit Institute*—The establishment of this institute was authorized to aid local industries with loans for longer periods than would be obtained from commercial banks. Mortgages on machinery and other fixtures while in possession of the mortgagee were also authorized. *Agricultural credit*—A revised text of a law on agricultural credit, combining all legislation on this subject, was promulgated by the Minister of Promotion on Mar. 22, 1928. *Institute of School Health*—A decree creating the Institute of School Health was signed by the President on Mar. 23, 1928. Its purpose was to direct the psychological and biological development of the child during its school years. The institute was to have two sections. One was to be devoted to training teachers in those phases of school health under their jurisdiction, to educating school nurses, and to giving special courses in physical education. The other section was to be that of school hygiene, as concerned with the pupils. *Settlement of government lands*—A decree opened to settlement by Chileans now living in other countries about 350,000 hectares of government lands not far from Puerto Montt. See also *EARTHQUAKES*.

CHINA. A Far-Eastern state forming the eastern part of Asia, on the Pacific Ocean, under a republican form of government after Feb. 2, 1912.

AREA AND POPULATION. China comprises 18 provinces, the so-called dominion of Sinkiang,

the dependencies of Manchuria, Fengtien, Kirin, and Heilungkiang, and the regions over which only nominal authority exists, viz., Mongolia and Tibet. Since China has not yet carried out a proper land survey or census, the area and population of its territory can be given only as estimates, as in the following table (figures for certain other countries are added for purposes of comparison):

Regions	Area in square miles	Population	
		Total	Density per square mile
China proper, including the three Manchurian Provinces	1,897,000	436,000,000	238
Mongolia	1,370,000	2,500,000	2
Chinese Turkestan ..	550,000	1,200,000	2
Tibet	465,000	6,500,000	14
Total, Chinese territory ...	4,282,000	446,200,000	104
South America ...	6,850,000	60,000,000	8
United States, exclusive of dependencies	3,620,000	110,000,000	30
Japanese Empire ..	260,000	80,000,000	307
France (continental)	207,000	40,000,000	150

The population of the Great Yangtze Basin is estimated at 200,000,000. The Yangtze Delta, comprising an area of 50,000 square miles, or about that of the State of Illinois, has an estimated population of 40,000,000. Two-thirds of China's population is concentrated in one-third of its area, being densest along rivers and in coastal regions. Mongolia, Turkestan, and the three Manchurian Provinces offer vast areas of fertile lands for settlement and mineral resources for development, but lack of adequate means of transportation and protection against brigandage have discouraged settlement of these sections. The accompanying table gives certain essential data concerning the area and population of the Provinces of China:

POPULATION AND AREA OF CHINA BY PROVINCES

Province	Area in square miles	Population according to Chinese Post Office estimate, 1922	Capital of Province
Anhui	54,826	19,850,000	Anking
Chekiang ...	36,680	22,000,000	Hangchow
Chihli	115,830	34,200,000	Paoiatingfu
Fukien	46,332	13,200,000	Foochow
Honan	67,954	30,850,000	Kaifeng
Hunan	83,398	28,450,000	Changsha
Hupeh	71,428	27,150,000	Wuchang
Kansu	125,483	6,000,000	Lanchowfu
Kiangsi	69,498	24,500,000	Nanchang
Kiangsu	38,610	33,800,000	Nanking
Kwangsi	77,220	12,350,000	Kweilin
Kwangtung ...	100,000	37,150,000	Canton
Kweichow ...	67,182	11,100,000	Kweiyang
Shansi	81,853	11,000,000	Taiyuanfu
Shantung ...	55,984	30,800,000	Tsinan
Shensi	75,290	9,450,000	Sianfu
Szechwan ...	218,533	49,800,000	Chengtu
Yunnan	146,714	9,850,000	Yunnanfu
Shengking (Manchuria)	363,700	22,100,000	Mukden
Kirin (Manchuria)			Kirin
Heilungkiang (Manchuria)			Tsitsihar
Total	1,896,515	433,500,000	
Sinkiang ...	550,000	2,500,000	Urga
Mongolia ...	1,370,000	2,500,000	Lhasa
Tibet (Chinese estimate) ..	465,000	6,500,000	
Grand total	4,282,000	445,000,000	

The figures pertaining to area and population as given in the foregoing table are taken from the Chinese Post Office estimates of 1922. Where these figures are given otherwise in this book, the reader is at liberty to make his own choice—for China up to the end of the year 1928 had taken no official census.

There are similar divergences in the estimates of the population of the cities. According to the Government estimate of 1921, the population of Peking and its suburbs was about 1,300,000. Another estimate places it at 924,334, including 4000 foreigners. The estimates for the chief Chinese ports in 1925 given out by the Chinese Maritime Customs were as follows: Shanghai, 1,500,000; Hankow, 1,646,800; Canton, 900,000; Hangchow, 340,200; Changsha, 535,800; and Soochow, 500,000. The total number of foreigners and foreign residents in China in 1926 according to the Chinese Customs authorities was 346,883, of whom 235,339 were Japanese, Russians, 74,089, British, 14,670, Americans, 9401, Portuguese, 3296, Germans, 2963, and French, 2270. The treaty powers in China down to the beginning of 1928 were as follows: Russia, Great Britain, United States, France, Norway, Sweden, Denmark, Netherlands, Spain, Belgium, Italy, Peru, Brazil, Portugal, Japan, Mexico, Chile, Switzerland, Bolivia, Persia, and Germany. Of these powers, it was stated that Germany, Bolivia, Persia, and Chile had renounced the consular power.

EDUCATION. Education throughout China in 1928 was in a state of flux. Wherever possible, the Nanking government was reorganizing the educational system on the French model. If their plans were carried out, all academic and administrative work would be centralized directly in national and local educational institutions. The country was to be divided into university districts and in each district there was to be one government university, which, being the highest educational unit in the district, would take over administration. Above these districts there would be a national university, the highest educational organization in the entire country. The functions of a ministry of education, according to the plans, were vested in the National University.

In the China before the Nationalist movement there were two kinds of primary schools, the higher and the lower. The former were established by the district governments and were intended as intermediate schools between the lower primary schools and the middle schools. According to the latest available statistics the total number was 10,236 with 582,579 pupils. At the same time there were 167,076 lower primary schools with 5,814,375 pupils. At the beginning of 1928 there were 10 government universities, although their status and operations were rather shadowy because of the internal conditions of the country. Tsing Hua College, a special institution, was established near Peking, to prepare students for education in the United States, under the agreement on the part of the United States to return the Boxer indemnity for that purpose. There is a modern university for Chinese under British direction at Hong Kong which is attended by students from many parts of China.

The three forms of native religion are Confucianism, Buddhism, and Taoism. Besides these there are Mohammedans in all the provinces. The

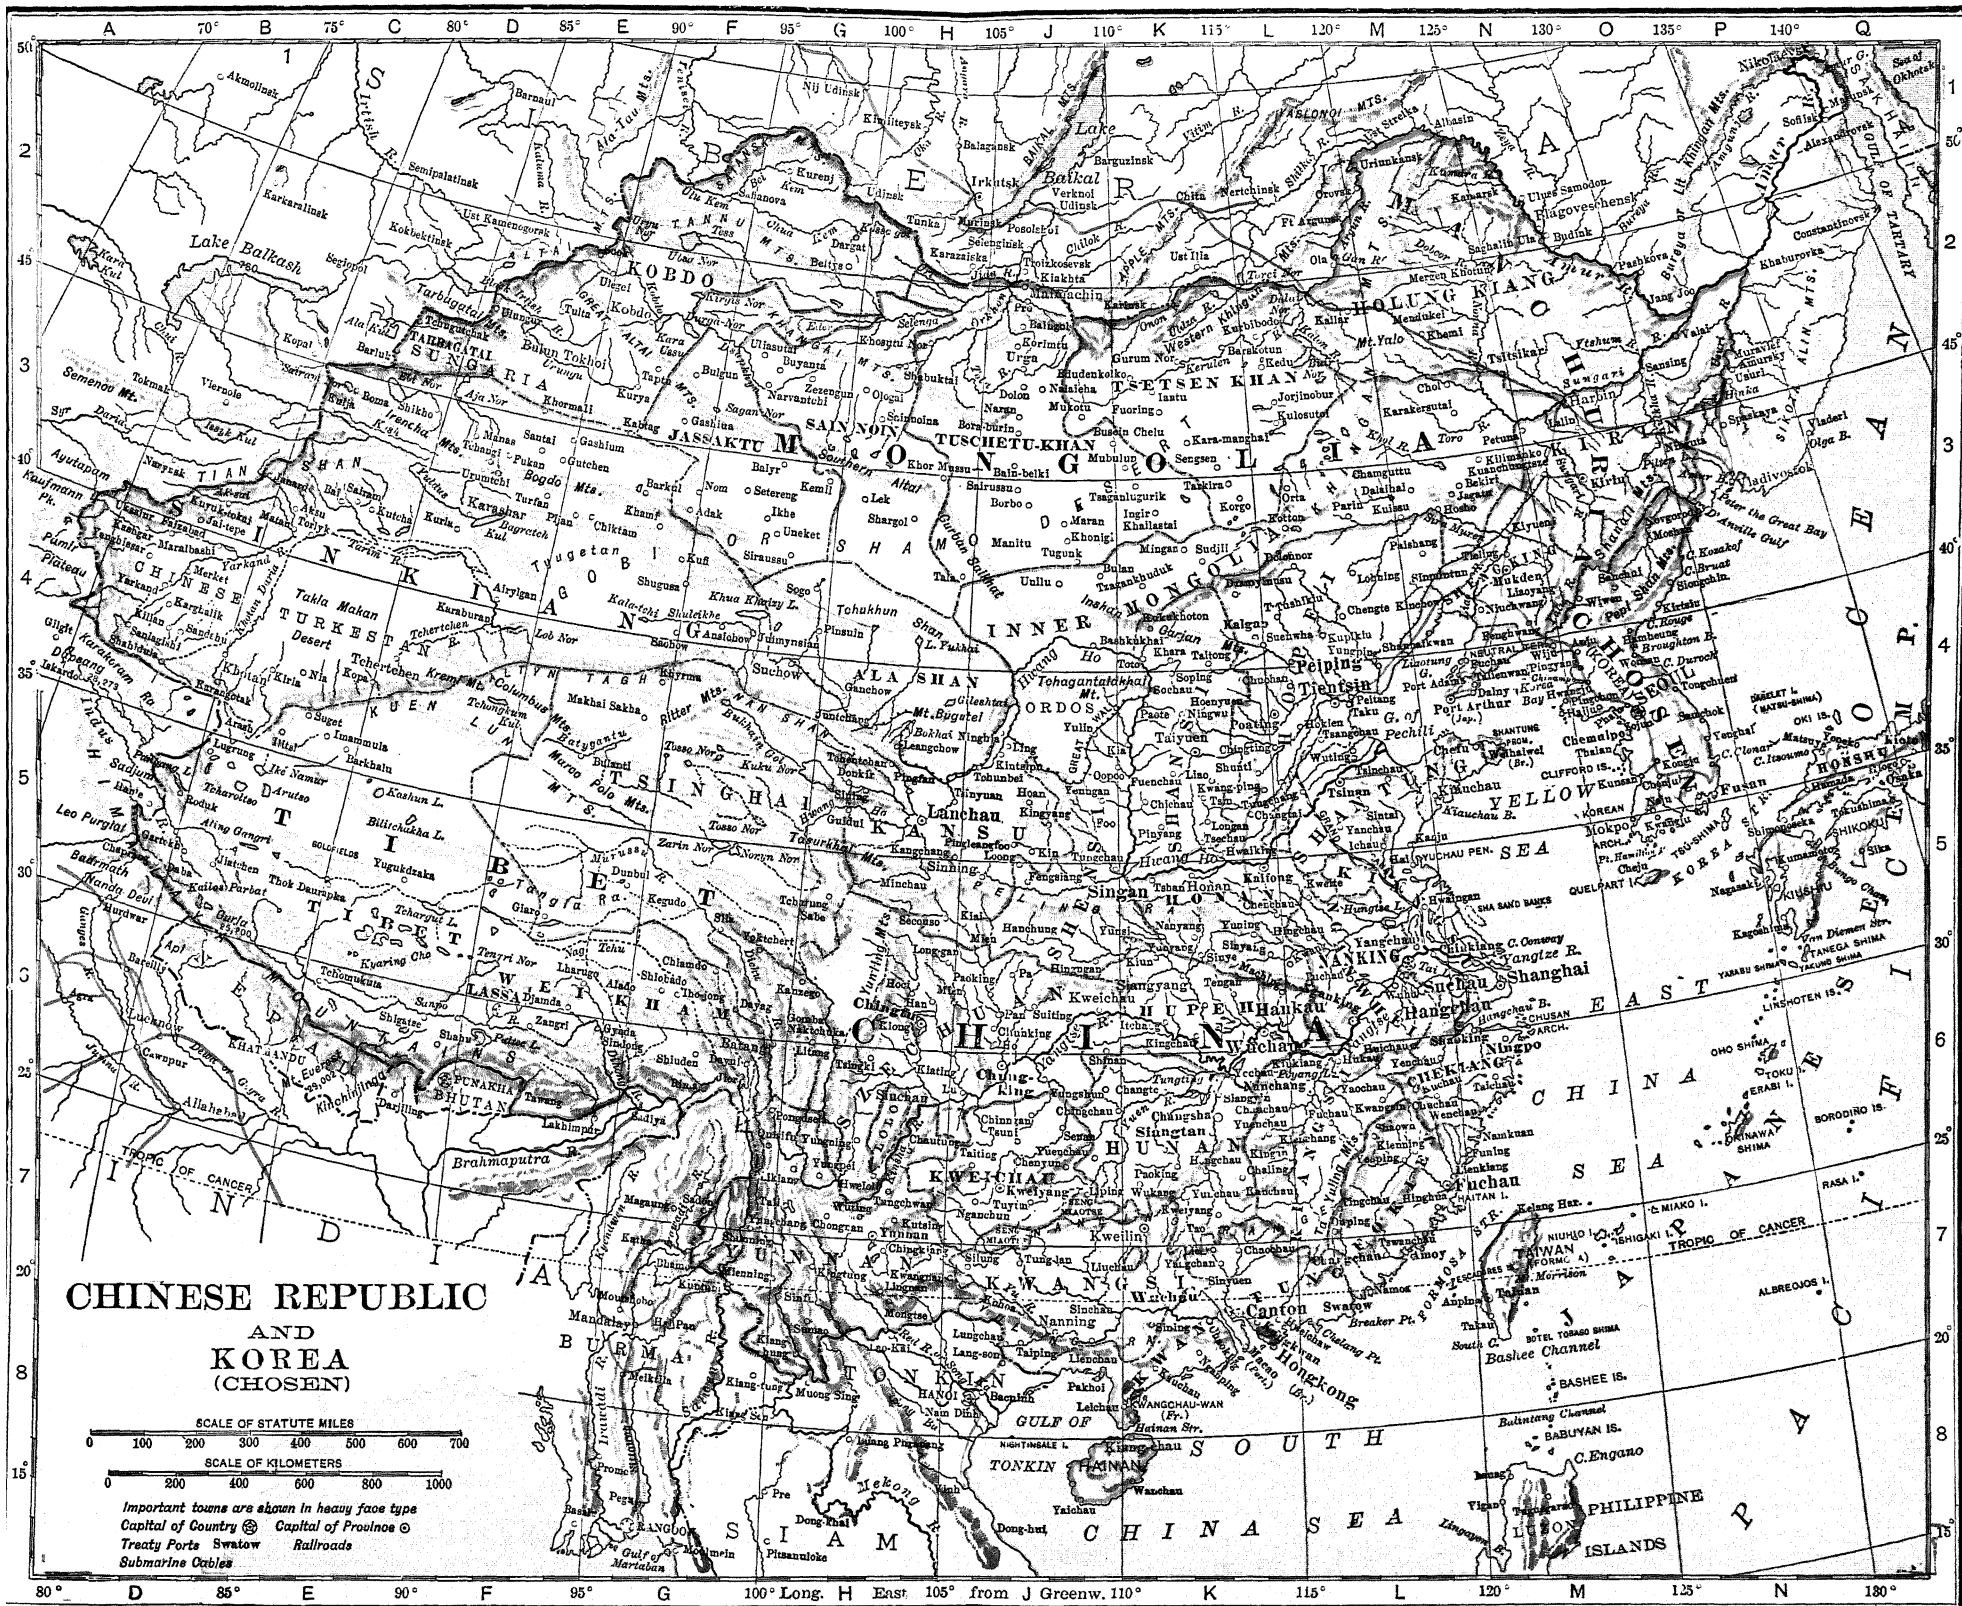

Roman Catholic Church at the end of 1923 maintained 57 bishops, 1481 European priests, and the native Roman Catholics numbered 2,208,800. The Protestant missions in 1920 had 6636 engaged in their service and the Chinese Protestants numbered 618,601. Attached to the Protestant missions were 27 colleges of university standing, 256 middle schools, and 581 higher elementary schools.

PRODUCTION, ETC. China is essentially an agricultural country. It has been estimated that the total arable land in the country amounts to 192,060 square miles. The holdings are generally small and the methods of the most primitive kind. Intensive agriculture, with the aid of some irrigation, is commonly found, as is the practice of rotating crops. Wheat, barley, maize, millet, and other cereals, with peas and beans, are chiefly cultivated in the north; rice, sugar, and indigo in the south. Cotton is grown widely even as far north as the northern part of the province of Chihli, the chief area of production being the Yangtze Valley. China's cotton production in 1927 totaled 2,000,000 bales (of 500 pounds each), of which 50 per cent was used by domestic mills, 33½ per cent for padding, and 16 per cent exported. Raw cotton imports in 1927 totaled 750,000 bales, one-third of which was American. All imports of cotton were used in mills, which turned out nearly 900,000,000 pounds of yarn and 9,000,000 pieces of cloth. Tea is cultivated exclusively in the West and the South. Silk culture, one of the most successful industries in the country, supplies about 25 per cent of the world's supply of raw silk.

An important feature in the development of the Chinese industries is the erection of cotton and woolen mills, and of silk filatures in Shanghai, Canton, and elsewhere, while native looms are found in most dwellings. The estimated production of cotton yarn in China during the year ended June 1, 1927, totaled 1,954,000 piculs, of which 676,000 piculs were produced in Japanese, 1,116,000 in Chinese, and 162,000 in British-owned mills. The estimated production of cotton piece goods amounted to 11,165,000 pieces, of which 5,658,000 pieces were manufactured in Japanese, 4,409,000 in Chinese, and 1,098,000 in British mills. At the beginning of 1928 the 118 cotton mills in China had 3,726,584 spindles and 24,382 looms. At the large centres flour and rice mills are beginning to supersede native methods of treating wheat and rice. There are over 150 modern mills.

China is tremendously rich in mineral resources, although they are scarcely exploited. The coal fields, which have been rated as the first in the world, cover an area of 133,613 acres and the average annual output is estimated at 16,000,000 tons. The production of iron ore is estimated at 1,500,000 tons yearly. Oil, both from wells and shale, is being produced in ever-increasing quantities. Copper, tin, antimony, wolfram, gold, and silver are also produced in commercial quantities. China's antimony mines supply 60 per cent of the world's needs.

COMMERCE. During 1927, the courage, tenacity, and ingenuity of Chinese merchants were taxed to the utmost—the more so since obstacles obstructing the free movement of goods were wholly domestic. Political agitation, military operations, commandeering of transportation facilities, labor disputes, and boycotts, combined with depression of local currencies and a tempo-

rary embargo upon silver exports, rendered trade spasmodic in some districts and paralyzed it in others. Treaty ports, not disturbed by actual warfare, were, nevertheless, hampered by the same heavy taxes and military exactions imposed elsewhere and by a pervading fear of uncertainty.

Notwithstanding these obstacles, the combined value of China's export and import merchandise trade in 1927, aggregating 1,931,552,000 taels, or \$1,332,770,000, exceeded expectations. This total represented a loss of 2.9 per cent as compared with the figure for the preceding year, but was 12 per cent above that for 1925. The total value of China's merchandise sold abroad increased from 864,295,000 taels, or \$656,864,000, to 918,620,000 taels, or \$698,151,000. In contrast, China's purchases of foreign products aggregated 1,012,932,000 taels, a loss of nearly 10 per cent from the value of imports in 1926; a gain, however, of approximately 6.8 per cent over the import value of 1925. The fall in silver exchange to the lowest point since 1915 was favorable to larger imports, but was more than offset by the silver embargo which made it difficult for Chinese merchants to finance their imports, and by adverse conditions which tended to intimidate trade.

In the foregoing table which lists the leading items entering into China's export and import trade, it is shown that 13 commodities constituted 84.8 per cent of the total value of imports into China during 1926, but only 70 per cent during 1927.

From the following table, which shows the distribution of China's foreign trade for 1926 and

1927 among the leading countries participating, it is evident that the United States and Japan continued the closest competitors:

DISTRIBUTION OF CHINA'S TRADE BY PRINCIPAL COUNTRIES OF ORIGIN AND DESTINATION

[In thousands of haikwan taels—000 omitted]

Countries	1926		1927	
	Exports	Imports	Exports	Imports

FINANCE. It is impossible to give a definite or an accurate statement as to China's fiscal operations. With the widespread political and military agitation and operations, apparently no account of revenue and expenditure for the country at large can be obtained. According to a statement issued by the officiating inspector general of customs of the Chinese Government, disturbed economic conditions during 1927 were responsible for a considerable decrease in Maritime Customs revenue. Total collections for the year reached 68,687,000 haikwan taels, or 9,534,000 taels less than in 1926. Native customs revenues during 1927 aggregated 3,784,000 haikwan taels, a decrease of 720,000 as compared with such revenues for 1926. The statement of the officiating inspector general disclosed that (1) all foreign-loan and indemnity obligations secured on the customs revenue, including the service of the reorganization loan, have been met in full; (2) the service, both interest and redemption, of all domestic loans secured on canceled indemnities has been met in full; and (3) the interest on those domestic loans which are secured on the customs revenue surplus were also met in full. Owing to deficiency of revenue, no redemption payments of any of these loans could be made, in consequence of which, redemption payments of the consolidated debt were two years in arrears of schedule.

Following the inauguration of the new Government on Oct. 10, 1928, regulations were promulgated establishing the National Bank of the Chinese Republic. The bank is capitalized at approximately \$9,200,000 and is authorized to issue convertible bills, mint coins, and direct the flotation of foreign and domestic loans. Its head office was to be at Shanghai.

COMMUNICATIONS. During 1926, 158,996 vessels of 134,659,606 tons entered and cleared Chinese ports. Chinese railroads include about 9370 miles of railway, counting in the 1857 miles in Manchuria. See **MANCHURIA**. Operations in 1928 as in 1927 were severely limited due to the unsettled conditions of the country. Tracks, roadbeds, and equipment sank to a very low state of repair and it will be years before China will have a workable transportation system, built and operated along modern lines.

GOVERNMENT. During most of 1928 it may be said that China had no government at all, although the Nationalists in the South and the Peking Government in the North made claims of ruling their respective sections. For the establishment of an apparent all-China Government see below under *History*.

HISTORY

The year 1928 possibly saw the dawn of a new era for China. By the close of the period the entire country was under the sway of the Nationalist movement, even Manchuria, the envy of Japan, raising its banners in support of the Nanking Government before the new year came in. The Nationalist Government made great strides forward in attaining its objectives, the unification of China, the end of foreign domination, and the eradication of corruption and inefficiency. The dominant leader in the sweeping change throughout the country was the political and military leader of the Kuomintang, Chiang Kai-shek, the same man who appeared to have lost his grip in 1927. In the early spring plans and preparations were made by the Nationalists

under Chiang Kai-shek, the Northerners under Chang Tso-lin, and the Kaifeng Province under Feng Yu-hsiang to renew the hostilities which had been the ruination of China's economic and political life for over a decade. It appeared that Chang Tso-lin was ready to take the field with superior forces and munitions with the object of annihilating Feng Yu-hsiang before any help could be sent to him from Chiang Kai-shek.

After several months of inactivity the forces under Chiang Kai-shek began to move on Shantung, with the capital, Tsinan-fu as the objective. The city was captured on May 1, but brought the Nationalists into serious conflict with the Japanese. In the last week of April the Japanese Government had been sending reinforcements into the Province of Shantung, theoretically for the protection of her citizens and property, but probably with the idea of keeping this wealthy province out of the hands of Chiang Kai-shek. The inevitable occurred of course. The Nationalist Government strenuously protested the sending of foreign troops and when its protest went unnoticed, a clash occurred between the armed forces of the Nationalists and the Japanese. Street fighting broke out on May 3, and the Japanese general ordered the Nationalists to leave the city and remain an appreciable distance outside of its walls.

When this ultimatum was refused, the superior Japanese Army began an attack which was intended to drive the Nationalists from the city. During the night of May 11, the Nationalist forces fled from the city after agencies interested in peace had used every effort to end hostilities. At the end of the struggle Japan was left in complete control of the city. Chiang appealed to the League of Nations and also further protested to the Japanese Government, but received no satisfactory reply to his complaint that the Japanese were the aggressors in the struggle.

This Tsinan-fu affair was only a temporary check to the march of progress of the Nationalists, however. The next object of their attack was Peking, the stronghold of Chang Tso-lin. The capture of the city, the objective of the Nationalists ever since 1926, was a comparatively simple affair. Chang, probably upon the advice of Japan, decided to abandon the city and flee into Manchuria with his Northern Army. Forces of Yen Hsi-shan, the Governor of Shansi, first entered the city on June 5 and formally took possession of it on June 8. While Chang was in flight to Mukden, his Manchurian capital, his train was bombed and he received wounds from which he later died.

The Nationalists failed to move into Manchuria with their forces, probably because of the solemn warning given by Japan that her interests in that province were so great and of such a nature that she could not allow them to be interfered with by civil war. Japan had economically penetrated the district to such an extent, that to all intents and purposes it was her own. The death of Chang, which in some quarters was laid at the door of Japan, removed the last great leader in the path of Nationalist supremacy. The reason some observers place the blame of Chang's death on Japan was because of the strained relations that existed between that country and the overlord of Manchuria for some time before his death. Previously he had been a mere tool of the Japanese Foreign Office, but in recent years, especially since his removal from Mukden to

Peking, he had chafed under Japan's political and military guidance and had shown signs of ultimately breaking completely with Tokyo. There were certainly suspicious features of the bombing, which must have been known to the Japanese guards long before the train arrived.

Chang's death was kept a secret for almost three weeks. It was thought that had not Japan known that the opinion of the world would have been decidedly against her, she would have seized Manchuria then and there. The Nationalist leaders sent representatives to Mukden to talk things over with Chang's followers and were cordially received by Chang's eldest son, who succeeded his father as overlord of Manchuria. As a result of the parley, the Manchurian leaders agreed to recognize Nanking's authority and to raise the Nationalist flag under certain conditions. When the Japanese Government learned of this, the younger Chang was told that such action was fraught with grave consequences and that Japan would be forced to take such steps as seemed necessary to maintain the status quo. Reinforcements were sent by Japan to Mukden and the Chinese authorities there determined that it would be the best policy to hold up allegiance to Nanking for the time being, through necessity rather than through choice.

Whatever influence Japan had with the people of this wealthy province disappeared at this time and the vast bulk of the people became very anti-Japanese, having in mind, possibly, the fate of Korea a number of years previous. Despite the efforts of the best Japanese diplomats, the Government of Mukden remained firm in its intention of allying itself with the Nationalist Government, consenting only to the delay of the announcement for a period of three months. At the expiration of this time the formal acceptance of allegiance to Nanking was adopted and China was a unit once again, for the time being at least. Foreign observers asked the question, "How long?"

With the cessation of the civil war, the new Government started to prepare for peace. The capital of China was moved from Peking to Nanking and the name of the former city was changed to Peiping. In a formal announcement the Nanking Government stated that the military aspects of the civil war were over and the full efforts of the Government would be put forth to reabsorb the millions of soldiers into industry. The Government was to be neither militaristic nor communistic but was to be based on the principles of the Kuomintang, nationalism, democracy, and the people's welfare. Almost as soon as the firing had died away, the Nanking authorities began negotiations to clear up the international aspects of the situation. The United States was the first nation to accept the invitation of the Chinese Government to negotiate the tariff question, and on July 25, a treaty was signed between the two countries repealing the tariff provisions of the treaty of 1903, by which China was limited to a 5 per cent ad valorem duty, and providing for China's right to make her own tariffs. The treaty was to become effective on Jan. 1, 1929, subject to ratification. The United States Senate had not ratified the treaty down to the close of the year, due to more pressing problems confronting it.

The American Secretary of State, Mr. Kellogg, in a very cordial note sent to the Chinese authorities very shortly before the signing of

of the treaty stated: "The good will of the United States toward China is proverbial and the American Government and people welcome every advance made by the Chinese in the direction of unity, peace, and progress. We do not believe in interference in their internal affairs. We ask of them only that which we look for from every nation with which we maintain friendly intercourse, specifically, proper and adequate protection of American citizens, their property and their lawful rights, and, in general, treatment in no way discriminatory as compared with the treatment accorded to the interests or nationals of any other country. With a deep realization of the nature of the tremendous difficulties confronting the Chinese nation, I am impelled to affirm my belief that a new and unified China is in process of emerging from the chaos of civil war and turmoil which has distressed that country for many years. Certainly this is the hope of the people of the United States." It was felt in many quarters that the prompt token of friendship expressed by the United States may have had some effect on the Japanese attitude toward Manchuria.

The action of the United States was followed by almost identical action by several other powers before the close of the year. Twelve nations concluded new treaties with the Nanking Government, and of the twelve, Italy, Belgium, Spain, Denmark, and Portugal pledged themselves to relinquish extraterritoriality by Jan. 1, 1930. All the twelve agreed to Chinese tariff autonomy. It is significant to note that the only country which refused to negotiate a new treaty was Japan. The contents of most of these treaties were not published until the last week in December. On December 20 Great Britain formally recognized the Chinese National Government.

On October 9 the civil government was virtually established by the election of Chiang Kai-shek as the head of the Government of China. What actually happened, of course, was not an election in which the people participated, but a selection by the executive committee of the Kuomintang. Very shortly afterward the following cabinet was announced: Foreign Affairs, C. T. Wang; Finance, T. V. Soong; War, Feng Yu-hsiang; Agriculture, Yi Pei-chi; Industry, H. H. Kung; Education, Chiang Mengling; Railways, Sun Fo; Interior, Yen Hsi-shan; Communications, Wang Po-chun; and Health, Hsueh Tu-pi. Dr. C. C. Wu was appointed Minister to Washington to succeed Dr. Sze, who was transferred to London.

The organic law of the National Government of the Republic of China, as published in the *Times Current History* for December, 1928, provides in its more important sections as follows:

The National Government shall be composed of five yuan, executive, legislative, judicial, examination and control. There shall be a President and from twelve to sixteen State Councillors of the National Government, from which the Presidents and Vice Presidents of the five yuan shall be appointed.

The National Government shall conduct national affairs through a State Council, of which the President of the National Government shall be the Chairman. All matters which cannot be settled between two or more yuan shall be referred to the State Council for decision. All laws promulgated and all mandates issued by virtue of a decision of the State Council shall be signed by the President of the National Government and shall be countersigned by the Presidents of the five yuan. Each of the five yuan may, according to law, issue orders.

Executive Yuan—The executive yuan shall be the highest executive organ of the National Government and

shall have a President and Vice President, the latter substituting in the absence of the President. The executive *yuan* shall establish Ministries to which will be entrusted various executive duties and may appoint commissions for specified executive matters. The Ministries shall each have a Minister, a political Vice Minister and an administrative Vice Minister, and the various commissions shall each have a Chairman and Vice Chairman, all of whom shall be appointed and removed by the National Government at the instance of the President of the executive *yuan*.

Legislative Yuan—Budgets, amnesties, declarations of war, peace negotiations, and the conclusion of treaties and other important international matters are to be submitted to the legislative *yuan*; also the appointment or dismissal of all officials above third-class rank; also all matters which cannot be settled between the various Ministries and commissions of the executive *yuan*, and all matters which according to law or in the opinion of the President shall be decided at such meetings.

The legislative *yuan* shall be the highest legislative organ of the National Government and shall have power to decide upon legislation, budgets, amnesties, declarations of war, peace negotiations and treaties and the conclusion of other important international matters. It shall have a President, Vice President, and shall be composed of from forty-nine to ninety-nine members to be appointed by the National Government at the instance of the President of said *yuan*.

Judicial Yuan—The judicial *yuan* shall be the highest judicial organ of the National Government and shall take charge of judicial trials, judicial administration, the disciplinary punishment of officials and the trial of administrative cases. The granting of pardons, reprieves and the restitution of civic rights shall be submitted by the President of the judicial *yuan* to the National Government for approval and action. The judicial *yuan* shall have a President and Vice President and may introduce bills within its competence into the legislative *yuan*. The organization of the judicial *yuan* shall be determined by law.

Examination Yuan—The examination *yuan* shall be the highest examination organ of the National Government and shall take charge of examinations and determine the qualifications for public service. All public functionaries shall be appointed only after they have passed an examination and their qualifications for public service have been determined by the examination *yuan* which shall have a President and Vice President and may introduce bills on matters within its competence into the legislative *yuan*. Its organization shall be determined by law.

Control Yuan—The control *yuan* shall be the highest supervisory organ of the National Government and shall, according to law, exercise the following powers: impeachment and auditing. The control *yuan* shall have power to introduce into the legislative *yuan* bills on matters within its competence. The organization of the control *yuan* shall be determined by law.

CHREE, KRĒ, CHARLES. Scotch physicist and authority on terrestrial magnetism, atmospheric electricity, and allied subjects, died at Richmond, England, August 12. He was born at Lintrathen, Forfarshire, Scotland, May 5, 1860, and was graduated with the highest honors from the University of Aberdeen, in 1879. He received a mathematical scholarship at King's College, Cambridge, where also he achieved honors, and was elected a fellow in 1885, being reelected as research fellow five years later. Working at the Cavendish Laboratory, and developing an interest in terrestrial magnetism, and atmospheric electricity, he was appointed superintendent of the Kew Observatory in 1893, a position which he held until his retirement in 1925. Under his direction the Kew Observatory attained a leading position among the magnetic observatories of the world, and considerable testing was carried on here until the work was taken over by the National Physical Laboratory. Dr. Chree served as president of the Royal Meteorological Society, and of the Physical Society of London. He was also president of the section for terrestrial magnetism and atmospheric electricity of the International Commission for Geodesy and Geophysics. He received the Sc.D. degree from Cam-

bridge in 1896, and the LL.D. degree from the University of Aberdeen two years later. He was elected Fellow of the Royal Society in 1897, receiving its Hughes Medal in 1919. He had previously been awarded the James Watt Medal by the Institution of Civil Engineers, in 1905. He published a notable monograph on *Terrestrial Magnetism* in 1912, and delivered the seventh Kelvin lecture on the same subject before the Institution of Electrical Engineers, in 1916. He wrote many scientific papers.

CHRISTIAN CHURCH. A church originating in three religious movements, that of the Rev. James O'Kelly of Virginia, who, in 1792, opposed Methodist bishops, and those of the New England Baptist, Abner Jones, who organized a separate church in 1801, and of the Kentucky group, formed in 1804. These groups eventually united, all holding that minor points of belief should be subordinated to Christian brotherhood. A General Convention which first convened at Urbana, Ill., in October, 1826 meets every four years. Biennial conventions are held in districts, each consisting of a number of States. The Church carries on home and foreign missions, educational work, publication, evangelism, Christian unity work, social service, and other general activities. Its home-mission field includes new Americans in the East, the lumber camps in Washington, Indians, mountaineers, and Negroes; its foreign field, Japan, Porto Rico, and South America. It maintains eight educational institutions. Its publishing house at Dayton, Ohio, issues, among other periodicals, the oldest religious newspaper in the World, the *Herald of Gospel Liberty*. In 1928 the Christian Church had 1283 churches, 1047 ministers, and 110,326 members, and a total revenue of \$1,483,980. Its Sunday schools, numbering 1324, had 105,067 pupils.

CHRISTIAN ENDEAVOR, INTERNATIONAL SOCIETY OF. An organization comprised of all Christian Endeavor societies in North America, and a member of the World's Christian Endeavor Union, which comprises Christian Endeavor societies in every country on the globe. The first society was organized in Williston Congregational Church, Portland, Me., Feb. 2, 1881, by the late Rev. Francis E. Clark, who for many years was president of the international and world's organizations. The present name was adopted by vote of the Board of Trustees in August, 1927, previous to which time the Society was known as the United Society of Christian Endeavor.

The Society is organized into departments to carry on its work, among the more important being: a Department of Christian Vocations, under the direction of the Rev. Stanley B. Vandersall, which yearly gives vocational counsel to thousands of young people in high schools and colleges; and the Department of Travel and Recreation, which supplies, free of charge, monthly church-centred recreation service to Christian Endeavor Societies and church workers and conducts World Friendship Tours to Europe for young people at cost. The society promotes systematic and proportionate giving through the Tenth Legion, in which 1268 were enrolled during the year, and emphasizes regular habits of prayer and daily Bible reading through the Quiet Hour, in which 6972 were enrolled. The organization of the international society comprised an active organization for each State and each Canadian Province. These in turn were divided

into 1200 city, county, and district unions, each including 400 to 500 societies. There were, in 1928, approximately 80,000 societies throughout the world, with a membership of 4,000,000. The international society, which meets biennially, held a convention at Cleveland, Ohio, July 4-9, 1927, with a total attendance of more than 17,000, and the 1929 meeting was planned for Kansas City, Mo., July 3-8. The officers for the year were: President, Daniel A. Poling, D.D.; vice presidents, the Rev. William Hiram Foulkes, D.D., and the Rev. Howard B. Grose, D.D.; treasurer, A. J. Shartle; secretary, E. P. Gates. The headquarters of the society are at Mount Vernon and Joy Streets, Boston, Mass.

CHRISTIANS. See DISCIPLES OF CHRIST.

CHRISTIAN SCIENCE. A system of metaphysical or spiritual healing discovered by Mrs. Mary Baker Eddy in 1866. The first church was established by Mrs. Eddy in Boston in 1879 and given a charter by the Commonwealth of Massachusetts. In 1892 it was reorganized as a voluntary religious association known as the First Church of Christ, Scientist, in Boston, called more frequently by its adherents the "Mother Church." Mrs. Eddy wrote the textbook of the movement, *Science and Health with Key to the Scriptures* published in 1875. The Sunday services of the church are conducted by a first and second reader, the first reading from the textbook, and the second from the authorized version of the Bible. In 1928 there were over 9885 practitioners of Christian Science in the United States and other countries, who devoted their entire time to healing the sick through prayer.

A Board of Directors administered the affairs of the Mother Church. Its annual meeting was held in Boston, June 4. Reports indicated expenditures totaling \$1,756,707.71 from the General Fund of the Church during the year, and \$1,011,000 from the Permanent Special Funds, and \$150,000 for relief of the Mississippi flood victims. During the fiscal year ending May 31, 91 churches and Christian Science societies, including three university societies, were recognized as branches of the Mother Church; 20 new organizations were located in Europe, and 1 in Australia. The total number of recognized branches, including 32 college and university societies, was 2344. Three departments conduct the principal activities of the movement: The Board of Education, Board of Lectureship, and Committee on Publication. The educational board instructs and authorizes students to teach Christian Science; the Board of Lectureship consists of 24 members who deliver free lectures on Christian Science throughout the world. During the year, 3626 lectures were delivered, of which 3239 were in the United States and 387 in foreign fields.

The Committee on Publication aims to correct impositions on the public in regard to Christian Science. It also endeavors to guard the rights of Christian Scientists against restriction by public authority. The Christian Science Publishing Society, which publishes and issues the authorized literature of the Mother Church, operates under a deed of trust granted by Mrs. Eddy; its affairs are now administered by a Board of Trustees according to the Manual of the church. The publishing society issues the daily paper of the movement, *The Christian Science Monitor*; other periodicals include: *The Christian Science Journal*, *The Christian Science*

Sentinel, *Der Herold der Christian Science*, and *Le Héraut de Christian Science*. The Benevolent Association of the church conducts a sanatorium. The Pleasant View Home, opened July 15, 1927, was visited during the year by 13,500 persons. The headquarters of the church are at 206 Massachusetts Avenue, Boston. Mrs. Ella W. Hoag was president of the Mother Church for the year ending May 31, 1928.

CHRISTMAS ISLAND. An island belonging to Great Britain in the Indian Ocean, lying 190 miles southwest of Java, annexed to the Straits Settlements in 1888. Area, 62 square miles; population, estimated in 1926, 1043. Christmas Island is important because of its very large deposits of phosphate of lime which constitute its only export. In 1926 exports amounted to £228,296 and imports to £12,723. The chief imports are tools, machinery, railway materials, and lorries. For administrative purposes the island is connected with the settlement of Singapore.

Christmas Island is also the name of the largest atoll in the Pacific Ocean. It belongs to the British colony of Gilbert and Ellice Islands.

CINCINNATI, UNIVERSITY OF. An institution for the higher education of men and women at Cincinnati, Ohio; founded in 1870. The registration for the autumn of 1928 was 9001 distributed as follows: Graduate school, 226; liberal arts, 1270; evening courses in liberal arts, 860; education 1189; engineering, 1525; evening commerce courses, 2931; applied arts, 343; household administration, 124; law, 174; medicine, 272; nursing and health, 87. The summer school enrollment was 1310. There were 571 members on the faculty. The endowment funds of the University for the year 1927 were \$6,239,545, and the income for the same period, \$1,820,821. The library contained 144,648 bound volumes and 40,000 pamphlets. Acting president, Herman Schneider.

CITY AND REGIONAL PLANNING. The city planning movement which began in the United States early in the present century had not gone on many years before it was recognized that adequate planning could not stop at city boundaries. The need for taking in larger areas became increasingly evident, but, as was the case with city planning in the United States at the start, there were no accepted governmental agencies to take up regional planning, as the broader movement was finally named. Just as in the early days of city planning in the United States, most of the work was done by private organizations, such as civic associations, chambers of commerce, or frequently by special committees, so has most of the regional planning

work been undertaken. The parallel continued as regards the gradual assumption of both city and regional planning by governmental organizations, but the percentage of instances of regional planning by governmental bodies was much smaller than that of city planning in the hands of municipal commissions.

City-planning commissions in the United States in 1928 numbered several hundred, although most of them had little more than advisory powers. If county-planning commissions were not counted as agencies of regional planning, as in most cases they probably should not be, then there were as yet but few regional planning organizations that were not private rather than public in character. This was a handicap to regional planning work beyond the mere paper-planning and pamphlet-reporting stage.

The chief centres of regional planning in the United States are Boston, New York City, Syracuse, Buffalo, Philadelphia, Chicago, Milwaukee, Minneapolis and St. Paul, Los Angeles, and San Francisco. At Boston, investigations were being made by a division of metropolitan planning within the Metropolitan District Commission, under legislation of 1923. At Syracuse and Buffalo, it was being carried out under State legislative authority. How to set the boundary within which a given regional planning study should be made is for the most part subject to rather arbitrary decision. Frequently, a number of counties are embraced within such a region. Sometimes two or more States are concerned.

The regional plan of New York and its environs has so long a radius as to include not only a number of counties in New York State but also one in Connecticut and a number in New Jersey. The Philadelphia regional-planning studies cover parts of three States. For an outline of regional planning and of engineering work to put it in effect, see *Engineering News-Record*, Oct. 4, 1928, p. 496, and for a description of the activities of the Chicago Regional Planning Commission, see the same journal for Nov. 22, 1928, p. 758, these being the first two of a series of articles by W. W. DeBerard, lately chief engineer, Chicago Regional Planning Association. Other articles will follow in 1929.

In 1928, the Committee on Regional Plan of New York and Its Environs published Nos. 4 and 5 of its eight *Survey Volumes*, these two being on "Transit and Transportation" and on "Public Recreation." Besides the eight *Survey Volumes*, the committee was getting out a series of monographs and it also was to publish two *Plan Volumes*, one "Planning Principles and Standards with Illustrated Proposals" and the other an "Atlas of Complete Graphic Plans of New York Region with Descriptive Text."

Activities in the field of city as distinguished from regional planning continued unabated, more particularly as regards the establishment of major traffic highways, civic centres, and zoning regulations. A conflagration at Fall River early in 1928, which swept the centre of the city, was followed by the preparation of tentative plans for wider streets and for the location of new public buildings. New city halls at Duluth, Minn., and Los Angeles, Calif., were built as parts of civic centre plans.

As the result of two years of study, the City Committee on Plan and Survey, appointed by Mayor Walker of New York City, made a report in June, 1928. The committee, which consisted

of 507 citizens, was divided into eight sub-committees, each of which made a separate report as follows: Housing, zoning, and the distribution of population; port and terminal facilities; traffic regulation and street uses; sanitation and harbor pollution; highways and bridges; parks and recreational facilities; departmental organizations; finance, budget, and revenue. The leading recommendation of the committee was the creation of a permanent planning board for New York City to "include both architectural and engineering members." Besides the city planning board, the general committee stated that there should also be one or two regional planning advisory boards for the New York State counties within the New York region; a similar advisory planning board for the New York counties forming a part of the New York region. The report also stated that the main and subsidiary organizations just mentioned "would not render it less desirable for the Committee on the Regional Plan of New York and Its Environs to carry on planning research."

ZONING. The number of cities in the United States having more or less complete zoning regulations on Dec. 31, 1928, was 723, according to reports of the U. S. Department of Commerce. This was an addition of 65 during 1928. The estimated population of the 723 cities in 1928 was more than 34,000,000. New York State led in the number of zoned municipalities, with 125. New Jersey had 83; California, 70; Illinois, 66; Massachusetts, 62; Pennsylvania, 40; Ohio, 38; Missouri, 28. Legislation to put into effect the constitutional amendment of 1927 specifically authorizing zoning in New Jersey was passed unanimously by the 1928 Legislature of that State after a series of attempts at weakening amendments.

ENGLAND AND WALES. A press summary of the report of the British Ministry of Health dealing with city planning in England and Wales indicated great activity in both town and regional planning in those countries "during the past year" (year covered not specifically stated). The dispatch stated that 157 local authorities with populations of 20,000 and more were engaged on town-planning schemes, while 236 other authorities with lesser populations had taken up planning work. In regional planning, there were 53 joint committees whose jurisdiction covers 836 local authorities and a total approximate area of 16,000,000 acres, on which there is a population of over 31,000,000 people.

CIVIC FEDERATION, NATIONAL. See NATIONAL CIVIC FEDERATION.

CIVIL ENGINEERS, AMERICAN SOCIETY OF. An association of professional engineers, founded in 1852 to advance engineering and architectural knowledge and practice, to maintain high professional standards, and to encourage intercourse between men of practical science. It is made up of: Members, including civil, military naval, mining, mechanical, electrical, and other engineers in active practice 12 years, and qualified to design as well as to direct engineering work; associate members, those who have been practicing eight years; juniors, beginners in the profession; affiliates, persons qualified to cooperate with engineers, but not themselves engineers; fellows, contributors to the permanent funds, who are not eligible to membership; and honorary members, persons of acknowledged eminence in engineering. Four general meetings are held each year: The annual meeting held the third week in January, in New York, at which the results of a previous ballot for officers are announced, reports of committees received and other business transacted; the annual convention, held during the summer, with general business and technical sessions, and interesting excursions; and the spring and autumn meetings. In addition to these out-of-town meetings, the various local sections hold meetings at frequent intervals.

In 1928 there were 46 local sections, and 93 affiliated student chapters in colleges throughout the country. The membership, as of Nov. 13, 1928, was 13,454, divided as follows: Honorary members, 16; members, 5555; associate members, 5833; juniors, 1904; affiliates, 139; fellows, 7. The annual meeting was held on January 18-20, and the spring meeting in Washington, D. C., April 25-27, at which the important business included papers on various technical activities of the Federal Government; the engineering features of the National Capital were also discussed, and a conference was held on the work of the student chapters.

The fifty-eighth annual convention, held in Buffalo, N. Y., July 17-20, considered the preservation and utilization of Niagara Falls, and the regulation of flow and navigation on the Great Lakes. At the autumn meeting, held on October 3-5, in San Diego, Calif., the general technical topic was the engineering features involved in air transport and its coordination with other transportation agencies, as well as the planning and location of airports and landing fields, with other municipal facilities. In addition to the general sessions at the quarterly meetings, conferences of local section representatives were held, and the nine technical divisions presented papers on various branches of civil engineering. Fifteen special committees, enlisting about 100 members, followed out investigations throughout the year, and over 80 members of the Society served on joint committees and boards, with representatives of other Societies, for research and standardization.

The Society publishes monthly *Proceedings*, containing the papers presented at meetings, with discussions, and items of general interest. At the end of each year, the papers and discussions are reprinted in the annual volume of *Transactions*. The Society also issues an annual *Year Book*. The officers for 1928 were: President, Lincoln Bush; vice presidents, John C. Hoyt, Arthur E. Morgan, George W. Fuller, and Louis C. Hill; secretary, George T. Sea-

bury; treasurer, Otis E. Hovey. The headquarters of the Society are in the Engineering Societies Building, 33 West 39th St., New York, of which, with three other national engineering societies, it is joint owner, as well as of the engineering library there installed.

CIVIL SERVICE REFORM LEAGUE, NATIONAL. Organized in 1881 for the purpose of putting to an end the so-called spoils system of making appointments to public office, it has sought to accomplish this end by promoting administrative efficiency through the application of the merit system to the appointment, promotion, and tenure of government officials. On the principle that public office is a public trust, it advocates that those best fitted through demonstrated ability and capacity should serve the state. The league is made up of local associations in various parts of the country and of individual members. During 1928, it sponsored legislation placing postmasters of the first, second, and third classes in the competitive civil service. It also urged legislation empowering the President to place in the competitive classified service all Federal positions then exempt by statute. It urged the adoption of the recommendations of the Joint Congressional Committee to include in the competitive service all of the field positions in the Internal Revenue Service, including collectors and deputy collectors of internal revenue and collectors of customs. It reported to Congress the need for the extension of the Civil Service Act to the District of Columbia service. The league successfully opposed the proposal in Congress to admit into the competitive service, without examination, the old prohibition agents, with the result that such positions were being filled after competitive examination. The league actively opposed the proposal in Congress to except from the merit system the numerous census employees.

Through its field division the league endeavors to secure the adoption and improvement of civil service laws in various states and cities throughout the country. Reports of its investigations are issued periodically. *Good Government* is the official organ of the league and the officers in 1928 were: President, George McAneny; chairman of the executive committee, W. W. Montgomery, Jr.; chairman of the council, Howard R. Guild; treasurer, A. S. Frissell; secretary, H. Eliot Kaplan. Headquarters are at 8 West 40th Street, New York.

CIVIL SERVICE RETIREMENT. See UNITED STATES, under *Pensions*.

CIVITAN INTERNATIONAL. An organization composed of selected professional and business men, throughout the United States, who have dedicated themselves to unselfish service to their city, county, state, or nation. The first Civitan Club was founded at Birmingham, Ala., in 1917. Civitan, a word coined by one of its founders, and meaning "the citizen," has as its motto, "Builders of Good Citizenship." The organization of field work of the club did not begin until 1920, but by 1921, when the first annual convention was held, there were 30 clubs; the membership in 1928 was over 7500. At the eighth annual convention, held in June, 1928, in Detroit, Mich., the programme of Civitan was stressed and the control of tuberculosis and the curbing of crime were especially emphasized. Several clubs have jointly sponsored the building of tuberculosis hospitals, notably in Knox-

ville, Tenn., where \$150,000 was raised for Beverly Hills, a tuberculosis sanatorium, and the Greer and Greenville Clubs which were also successful in obtaining \$150,000 for a sanatorium at Greenville, S. C. Among the activities of the individual clubs were the sponsoring of good citizen essay contests; care of crippled children, under-privileged children, baby clinics; scout work, boy-scout camps; programmes against crime; building of municipal golf courses; pig, corn, and cotton clubs; street paving; Americanization work; constructive health programmes; juvenile court work; city beautification; and the raising of scholarship funds. The official publication is *The Civitan*, a monthly, published at Knoxville, Tenn., Neal B. Spahr, editor. The national officers for 1928 were: President, James N. MacLean, New York; vice presidents, Robert W. Brooks, St. Louis, Mo., George W. Simons, Jr., Jacksonville, Fla., Sidney H. Guthrie, Dayton, Ohio; secretary, Neal B. Spahr, Knoxville, Tenn.; treasurer, Claude L. Hagan, Birmingham, Ala.; field secretary, Arthur Cundy, Mayfield, Ky. The headquarters of the association are at 1001-2 Jackson Bldg., Birmingham, Ala., and the secretary's office is at 1115-6 General Bldg., Knoxville, Tenn.

CLAIMS COMMISSION. See **ARBITRATION, INTERNATIONAL.**

CLARK UNIVERSITY. A non-sectarian university, comprising a college for men and a coeducational graduate division of arts and sciences, at Worcester, Mass., founded in 1889. The registration for the autumn of 1928 was 481, including 235 undergraduates, 65 graduate students, 16 special students, and 165 extension students. The enrollment for the summer session was 224. There were 40 members in the faculty. The productive funds amounted to approximately \$5,000,000. The university library contained 105,000 volumes. President, Wallace W. Atwood, Ph.D.

CLÉMENT, Klá'mä', EDMOND. A celebrated French dramatic tenor, died at Nice, February 22. He was born in Paris, Mar. 28, 1867. After graduation from the Paris Conservatoire as winner of the first prize, he made his début, in 1889, at the Opéra Comique as Vincent in Gounod's *Mireille*. With few interruptions for tours he remained with that institution until his death. In 1909-10 he sang at the Metropolitan Opera House, New York, and from 1911-13 with the Boston Opera Company. In 1921 he made an extensive concert tour of the United States and Canada. Besides, he sang as guest in the principal opera houses of Belgium, Spain, Portugal, England, and Denmark. In 1919 he was made Chevalier of the Legion of Honor. His art was characterized by subtle refinement.

CLEVELAND MUSEUM OF ART. See **ART MUSEUMS.**

CLIFTON, CHARLES. American automobile manufacturer and financier, died at Buffalo, N. Y., June 21. He was born at Buffalo, Sept. 20, 1853, and was educated at the Highland Military Academy, Worcester, Mass. After varied business experience, Mr. Clifton became, in 1897, secretary and treasurer of the George N. Pierce Company of Buffalo, and when that company was reorganized, in 1909 as the Pierce-Arrow

Motor Company he became its treasurer. In 1916 he was elected president and in 1919 chairman of the board. From 1904 to 1927 Mr. Clifton was president of the National Automobile Chamber of Commerce. He took an active interest in city planning and other civic matters, and especially in the problem of traffic congestion.

COAL. The world's production of coal in 1927 was estimated at 1,470,000,000 metric tons, or the greatest production since the World War, as is indicated in the accompanying table. While there was a decline in output in the United States, the United Kingdom occupied a more normal position on account of the settlement of the coal strike, and Germany and France both showed increased production.

The accompanying table, prepared by the United States Bureau of Mines, presents information for the principal countries of the world for 1927 and earlier years. The figures were taken from such official sources as were available, supplemented by trade information and were subject to revision, being considered a preliminary estimate.

WORLD PRODUCTION OF COAL OF ALL GRADES,
1914-1927^a

Year	Production, in part estimated (metric tons)	Percentage produced by United States
1914	1,207,000,000	38.7
1915	1,193,000,000	40.5
1916	1,291,000,000	41.5
1917	1,356,000,000	43.6
1918	1,333,000,000	46.3
1919	1,173,000,000	42.8
1920	1,320,000,000	45.3
1921	1,135,000,000	40.5
1922	1,226,000,000	35.3
1923	1,359,000,000	43.9
1924	1,357,000,000	38.2
1925	1,372,000,000	38.5
1926	1,365,000,000	42.7
1927	1,470,000,000	36.9

^a Includes lignite and sub-bituminous coal as reported, without attempting to reduce to equivalent tonnage of bituminous coal.

UNITED STATES PRODUCTION OF BITUMINOUS COAL. The total production of bituminous coal (including lignite and coal coked at the mines) during the calendar year 1928 was estimated by the United States Bureau of Mines at 492,755,000 net tons. In comparison with 1927, this was a decrease of 25,008,000 tons, or 4.8 per cent. As shown by the following table, the 1928 production was the smallest in any year since 1924.

UNITED STATES PRODUCTION OF BITUMINOUS COAL
[Net tons]^a

Period	Production	Average per working day
Calendar year		
1922	422,268,000	1,379,000
1923	564,565,000	1,845,000
1924	483,687,000	1,573,000
1925	520,085,000	1,692,000
1926	573,367,000	1,864,000
1927	517,763,000	1,684,000
1928 ^b	492,755,000	1,605,000

^a Figures for calendar years 1922-1927 are final figures as reported by the operators. Those for 1928 are preliminary estimates.

^b Subject to revision.

COAL AND LIGNITE PRODUCED IN THE PRINCIPAL COUNTRIES OF THE WORLD IN THE CAL-
ENDAR YEARS, 1924-1927, IN METRIC TONS

^a Estimate included in total.

^b Approximate production.

[†] Includes a small quantity of asphaltite.

[‡] Exclusive of output of State of Falcón (about 8,000 tons), for which estimate is included in total.

[§] Exclusive of mines in the Saar under French control.

^{||} Mines under French control.

[¶] Year ended Sept. 30.

[‡] Exclusive of Sakhalin.

^{*} Year ended Mar. 31 of year following that stated.

The outstanding event in the bituminous market situation in 1928 was the settlement through district wage agreements of the long-drawn-out labor controversy in the union fields of Illinois, Indiana, central Ohio, and the Southwest. Although the general acceptance of a wage cut by the miners increased the potential production, this was not entirely to the advantage of the industry, since large reserve stocks had been accumulating and there was no marked increase in consumption demands. Neither the Senate investigations in western Pennsylvania, eastern Ohio, and northern West Virginia mining fields, nor the expiration of the truce agreement in the central West and Southwest, with resulting danger of a tie-up in the remaining union fields, affected the market situation to any extent. Buying was limited largely to current requirements and usually occurred at times when conditions were favorable to the consumer, so that the sales realizations were not especially encouraging. Cargo shipments in 1928 exceeded those in 1927, the figures being 33,412,121 and 32,851,681 net tons, respectively, for the two years, with the increases in 1928 due largely to the new records established on the Great Lakes, where the shipments moved promptly from the docks of the Northwest and were maintained at a steady volume throughout the season of navigation.

ANTHRACITE. Commercial production of anthracite from 1922 to 1927 including shipments and local sales, but excluding colliery consumption, as reported by the United States Bureau of Mines, with an estimate for 1928 was given as follows:

UNITED STATES ANTHRACITE PRODUCTION

	Gross tons
1922	43,197,231 ^a
1923	76,328,026
1924	71,688,784
1925	50,582,990 ^a
1926	69,648,420
1927	65,662,550
1928	63,300,000 ^b

^a Strike years; ^b estimated.

According to estimates of the United States Bureau of Mines, the anthracite production for the year 1928, amounted to 76,734,000 net tons, being 4.2 per cent less than the total tonnage produced in the preceding year. Final figures for the year 1927 showed an output of 80,096,000 net tons. It was pointed out that the mild winter months in 1927 and 1928 were responsible for a decreased production, and that a prevalence of such conditions would affect the production for the winter of 1928-29. It was generally accepted that weather conditions, and not the substitution of oil or other fuels, had been and would continue to be, for some time at least, the principal factor governing the production of anthracite. In spite of a loss of markets in New England and other regions distant from the coal fields, during the strikes of 1922 and 1925, and the inroads made by substitute fuels, New England was returning to the use of coal, although Welsh and Scotch anthracite, German ovoids, and other foreign fuels were still imported in considerable quantities and "smokeless" domestic coal and fuel oil continued in use, due to resentment over the anthracite tonnage tax. Shipments of hard coal to New England showed a gratifying increase

over the previous year, and those to Canada, which takes 99 per cent of the anthracite exports of the United States, showed a similar recovery. The anthracite trade in the north-western territory, where the high cost of the product and high transportation and handling costs were responsible for the continued use of other fuels forced upon that section during the War, did not show the same recovery. Prior to the World War, shipments of anthracite over the Great Lakes averaged in excess of 4,000,000 gross tons; in 1913 it was a little over 5,000,000; in 1924 it had dropped to 2,814,515 tons; in 1927 to 1,702,592 tons; and in 1928 to 1,248,644 tons; and despite strenuous efforts to regain lost markets the figures indicate that the results have not been as encouraging as in Canada and New England.

Another disturbing factor in the distribution of anthracite was the extension of hand-to-mouth buying, already prevalent in other branches of household economics, to the providing of the fuel supply. As a consequence, domestic distribution of anthracite in the summer months of 1928 was considerably reduced as compared with former years, and the producers and distributors were confronted with the problem of inducing the purchase of domestic coal before it was needed for consumption. The matter of installment buying was under study and experimentation, in an effort partially to solve the problem. It was stated that the quality of anthracite in 1928 was better than it had ever been, while the industry further increased its service to the public by establishing a traffic bureau, and instituting mechanical research, aimed to improve methods of combustion, heat control, and ash handling.

An analysis of the market in various sections of the country shows some of the specific conditions reacting on the industry. In Colorado and New Mexico, the trade was largely dominated by the weather which was unfavorable to an increased demand. In Kentucky, wage reductions in the union fields north of the Ohio River and increased freight rate differentials in favor of Northern mines on lake cargo shipments affected competitive conditions, causing a decline in prices. In Cincinnati, Columbus, and Cleveland, Ohio, the situation was more or less unfavorable, due to weather conditions, and rate reductions in favor of other regions; in the Pittsburgh region adverse weather, overproduction of domestic grades, and wage cuts caused depression in the industry; central Pennsylvania producers fared somewhat better due to improvements effected and efforts to regain lost markets. Prices in New York were poor and affected producers of cheap grades, especially, and despite efforts to regain lost markets the results were disappointing. The Philadelphia market showed considerable improvement in stability, but consumption in Baltimore was less than in preceding years. For Bituminous coal strike, see STRIKES AND LOCKOUTS.

COAST GUARD. See PROHIBITION.

COCHIN-CHINA, kô'chin-chi'na. The southernmost colony in French Indo-China (see FRENCH INDO-CHINA). Area, estimated at 26,476 square miles; population estimated in 1928 at 4,119,832, consisting chiefly of Annamites, Cambodians, Moïs, Chams, and Chinese, with a few Indians, Malays, Tagals, and foreigners. In 1926 there were 12,865 French and 587 European

foreigners. Saigon, the capital, had a population in 1926 of 143,167, of whom 9892 were Europeans, exclusive of 3066 troops. Cholon had a population of 193,713 of whom 93,556 were Chinese. There are about 1445 schools with 3337 teachers and 104,464 pupils. About four-fifths of the 2,325,269 hectares under cultivation are given over to rice. In 1927, 5,118,000 acres were under its cultivation and in the same year the production of cleaned rice amounted to 1,486,006 metric tons. Other crops are maize, beans, sweet potatoes, ground-nuts, cotton, rubber, sugar cane, tobacco, coffee, coconuts, pepper, oranges, bananas, etc. Other sources of wealth are livestock and fisheries, the output of the latter being valued at 2,800,000 francs annually. There are 11 rice mills in Saigon and Cholon, which turn out 3000 tons of rice daily. There are also in these cities two sawmills, two soap factories, and a varnish factory. Commerce is largely in the hands of the Europeans and Chinese, although the Annamites are traders on a small scale. The total exports in 1926 amounted to 3,067,682,872 francs and the total imports to 1,835,375,255 francs. In the same year the local budget balanced at 19,471,075 piastres. Trade is carried on mainly through the port of Saigon, which was visited by 878 steamers of 1,959,577 tons in 1926. Cochin-China is ruled directly by a governor and a council of 24 members. It was in the French Parliament.

COINS, VALUES OF FOREIGN. The legal estimates of the values of foreign coins on Jan. 1, 1929, as issued by the Secretary of the Treasury are given in the table on page 176.

COKE. Statistics of the United States coke industry in 1928, published by the U. S. Bureau of Mines, gave a total production of 52,581,577 gross tons, of which 4,376,000 tons were beehive coke and 48,205,577 tons were by-product coke, the latter output being the largest on record. The production in 1927 is given in the table on page 177. These figures relate exclusively to beehive and by-product coke and do not include the output of petroleum coke, which amounted to 1,145,000 tons, nor of retort nor gas-house coke, the sales of which amounted to between one and two millions for the year. The figures include by-product coke ovens operated in conjunction with city gas supply.

The production of all coke in 1927 fell below the high marks reached in 1918, 1923, and 1926, although the decrease in output of by-product coke was rather negligible when compared with that of the previous year, being slightly more than 1 per cent, while a much larger percentage decrease of about 42 per cent occurred in the production of beehive coke. The production of all coke decreased from 56,865,567 tons in 1926 to 51,092,000 tons in 1927, with a distribution as follows: By-product coke in 1927, 43,885,000 as against 44,376,586 tons in the previous year; beehive coke, 7,207,000 tons in 1927, as against 12,488,951 tons in 1926. As is shown in these figures, most of the decrease in coke production was borne by the beehive branch of the industry, which was becoming more and more an auxiliary called upon to furnish only the surplus requirements of the metallurgical industry which cannot be met by the by-product ovens. The decrease in the coke

industry as a whole was in part due to the fact that 1926 figures for coke production were run up as a result of the demand for coke to meet the deficit in anthracite caused by the miners' strike, whereas in 1927 there was an abundant supply of anthracite. A more important cause, however, was the diminished activity of the blast furnace, the output of pig iron declining 7.3 per cent below 1926.

The changes in relative proportion of beehive and by-product coke are significant—the 1913 beehive ovens contributing 72.5 per cent of the total, while their share had fallen to 22

installation of 650 in the previous year. With the addition of the new ovens in 1927, the potential coking capacity of by-product plants at the close of the year, at 100 per cent operation, under favorable conditions, was 56,600,000 net tons, and with additions during 1928 the figure was raised to more than 58,000,000 tons. There were 79 by-product plants that produced coke in 1927, of which 44 were affiliated with iron furnaces, and 35 were non-furnace plants. The output of the furnace plants was 77.7 per cent of the total, and that of the non-furnace plants 22.3 per cent.

STATISTICAL SUMMARY OF THE COKE INDUSTRY IN 1927
[Based on Report of U. S. Bureau of Mines]

	By-product	Beehive	Total
Coke produced:			
Quantity net tons..	43,584,726	7,207,417	51,092,143
Value	\$232,043,803	\$30,276,775	\$262,320,578
Screenings and breeze produced:			
Quantity net tons..	4,099,702	146,362	4,246,064
Value	\$8,673,616	\$199,263	\$8,872,879
Coal charged into ovens:			
Quantity net tons..	63,239,773	11,208,115	74,447,888
Value	\$244,674,126	\$23,261,637	\$267,935,753
Average value	\$3.87	\$2.03	\$3.60
Average yield in percentage of coal charged:			
Coke	69.4	64.3	68.6
Breeze (at plants actually recovering)	6.5	3.1	6.2
Ovens:			
In existence Jan. 1	11,716	52,558	64,274
In existence Dec. 31	12,475	49,795	62,270
Dismantled during year	291	2,876	3,167
In course of construction Dec. 31	289	289
Coke used by operator in blast furnace or affiliated works:

Value	\$145,123,216	\$4,035,732	\$149,158,948
Disposal of coke:			
Sold for furnace use to affiliated corporations—			
Quantity net tons..	2,959,247	2,017,616	4,976,863
Value	\$15,903,197	\$9,153,274	\$25,056,471
Merchant sales of furnace coke—			
Quantity net tons..	976,786	2,780,433	3,757,219
Value	\$5,474,102	\$10,243,164	\$15,717,266
Sold for foundry use—			
Quantity net tons..	1,938,653	809,590	2,748,243
Value	\$15,112,967	\$4,085,876	\$19,198,843
Sold for domestic use—			
Quantity net tons..	4,702,529	111,103	4,813,632
Value	\$32,447,939	\$446,236	\$32,894,175
Sold for industrial and other use—			
Quantity net tons..	2,187,498	569,749	2,757,247
Value	\$14,660,531	\$2,154,443	\$16,815,024
Disposal of screenings and breeze:			
Used by operator—			
Quantity net tons..	3,439,571	47,406	3,486,977
Value	\$6,769,151	\$24,052	\$6,793,203
Sold—			
Quantity net tons..	716,237	38,277	754,514
Value	\$2,042,496	\$82,359	\$2,124,855
By-products produced:			
Gas M. cubic feet..	700,894,799	700,894,799
Tar gallons..	546,859,460	546,859,460
Ammonium sulphate or equivalent pounds..	1,434,920,352	1,434,920,352
Crude light oil gallons..	164,488,233	164,488,233
Value of by-products sold:			
Gas (surplus)	\$70,092,168	\$70,092,168
Tar	\$16,095,478	\$16,095,478
Ammonium sulphate or equivalent	\$27,883,268	\$27,883,268
Crude light oil and derivatives	\$25,153,099	\$25,153,099

per cent in 1926, and the depression in the iron industry in 1927 carried it still lower, the average for the year being 13.8 per cent, and a still smaller percentage for the month of December, 1927, when beehive ovens furnished only 9.4 per cent, as against 90.6 per cent furnished by the by-product ovens.

Pennsylvania, which has been the leading by-product coke producing State for several years, produced over 11,000,000 tons in 1927; Ohio ranked second, Indiana third, Alabama fourth, and New York fifth. Three new by-product plants started operations during 1927, and 660 new ovens were installed, as compared with an

COLDS IN THE HEAD. Dr. Hoelzel of the University of Chicago, a lifelong sufferer from colds, has been led to believe that diet plays a notable rôle in their genesis. Fasteners may show complete immunity, while starchy foods of all kinds are far more conducive to colds than diets of high protein and fat with a minimum of carbohydrate. This fact may be the true explanation of the immunity to colds of polar explorers and natives. A predominantly carbohydrate diet leads to water retention which renders the surface more sensitive to exposure.

COLGATE UNIVERSITY. A non-sectarian institution for the higher education of men at Hamilton, N. Y.; founded in 1819. In the autumn

of 1928 there were 993 students enrolled, and 84 members on the faculty. The productive funds amounted to approximately \$4,160,000, and the income for the year to approximately \$400,000. The library contained 114,000 volumes. Eaton Hall, formerly used by the Colgate Theological Seminary, became available to the College as a dormitory for freshmen, upon the merging of Colgate Theological Seminary in June, 1928, with the Rochester Theological Seminary, the new institution to be known as the Colgate-Rochester Divinity School, and located in Rochester, N. Y. President of the College, George Barton Cutten, Ph.D., D.D., LL.D.

COLLEGES. See **UNIVERSITIES AND COLLEGES.**

COLOMBIA. A South American republic in the northwestern part of the continent. Capital Bogota.

AREA AND POPULATION. The area of Colombia is given at 440,846 square miles and the population according to the census of Oct. 14, 1918, 5,855,077; estimated in 1927 at 7,282,924. The total population was distributed as follows: whites 20 per cent; negroes 5 per cent; Indians, 7 per cent; mulattoes, 18 per cent; mestizos, 50 per cent. The capital, Bogota, had a population in 1918 of 143,994, and estimated in October, 1923, at 166,148. The country is divided into 14 departments, 3 intendencies, and 6 commissionerships. Other important towns with their populations in 1918 are: Barranquilla, 64,543, estimated in 1923, 81,330; Medellin, 79,146, estimated in 1923, 86,641; Cartagena, 51,382; estimated in 1923, 68,119; Cali, 45,825, estimated in 1923, 68,777; and Manizale, 43,203, estimated in 1923, 51,838. By virtue of a law of Aug. 11, 1928, the taking of a general census of the Republic was authorized.

EDUCATION. According to the latest available statistics, there were 6674 primary schools with 395,541 pupils; 302 secondary schools with 6569 pupils; 25 industrial schools with 1392 students; and 6 art schools with 399 students. There were also 17 normal schools with 911 students. The oldest university is that at Bogota (founded in 1572). This and the school of mines at Medellin are national institutions. The other universities are departmental.

PRODUCTION, MINERAL RESOURCES, ETC. Notwithstanding the increasing importance of petroleum production within the past few years, Colombia continues to be primarily an agricultural country. Favorable coffee prices and a good crop are quickly reflected in an active market and increased imports. Coffee production, in fact, is considered the most reliable national barometer. Production has increased steadily and in recent years exports of this commodity accounted for about 80 per cent of the total value of exports. Prior to the World War, coffee represented but little more than 50 per cent of the total exports. The United States takes about 90 per cent of the total coffee shipments.

Colombia was unusually prosperous in 1925, 1926, and 1927, but toward the latter part of 1927 a downward trend was noticeable. The exceptionally favorable conditions of these three years can be traced primarily to excellent coffee crops marketed at high prices, and secondarily to the exploitation and exportation of petroleum, commencing with the opening of a pipe line from the oil fields at Barranca Bermeja to the seaport of Cartagena in the summer of 1926. Correspondingly, the signs of depression at the

end of 1927, were traceable to these two dominant factors, particularly to coffee, which exerts a broader influence upon the economic life of the country as a whole. It was estimated that the crop for 1927 would reach 2,450,000 bags of 60 kilos each, as compared with 2,454,000 bags in 1926. Although the weight of the crop was approximately the same for the two years, the export price showed a steady decline as the year 1927 advanced. Twelve million banana trees were blown down during May, 1927, with an approximate local loss of \$7,200,000. However, 8,454,000 bunches of bananas were exported during the year, as compared with 11,000,000 bunches in 1926. Owing to ample rainfall, the cotton and sugar-cane crops were good and were expected to show an increase over the 1926 production.

Colombia is rich in minerals. Gold is found in nearly all the departments and other minerals more or less worked are copper, lead, mercury, cinnabar, manganese, emeralds, and platinum. Colombia produces one-half of the world's output of platinum, the remainder coming from Russia. The Government operates the emerald mines which produce 90 per cent of the world's supply. Although only producing oil a comparatively short time, Colombia is already considered an important factor in making estimates of future world production. The completion of the work of looping the pipe line from the oil fields to the port of Cartagena increased the capacity of the line from 30,000 to 50,000 barrels per day. Petroleum exports totaled 13,679,000 barrels in 1927, as compared with 4,700,000 barrels in 1926. The production of petroleum in 1927 amounted to 15,760,797 barrels.

COMMERCE. The total value of all exports in 1927 was \$121,340,000, of which \$91,800,000 went to the United States. The coffee exports totaled 151,730,000 kilos valued at \$79,808,000; bananas, 196,624,000 kilos, valued at \$5,587,000; hides and skins, 7,229,000 kilos, valued at \$2,638,000. The platinum exported was valued at \$4,602,000. The value of imports was \$118,894,000. The United States supplied 43.3 per cent of the imports, the United Kingdom, 15.4 per cent, and Germany 12.7 per cent.

FINANCE. On Nov. 9, 1927, Congress approved the budget of ordinary receipts and expenditures for the fiscal year Jan. 1-Dec. 31, 1928, as follows:

<i>Revenues</i>	
<i>Source</i>	<i>Pesos</i>
National property	8,885,418.47
Taxes	32,168,548.94
National services	2,585,211.44
Sundry revenues	1,754,877.87
New revenues	5,050,000.00
Probable surplus, 1927	2,000,000.00
Total revenues	51,944,056.72
<i>Expenditures</i>	
<i>Branch of Government</i>	<i>Pesos</i>
Ministry of Government	9,197,017.10
Ministry of Foreign Relations	676,013.60
Treasury and Public Credit	7,004,340.38
Ministry of War	6,927,298.95
Ministry of Industries	1,573,309.70
Public Instruction and Health	5,354,579.63
Ministry of Public Works	7,947,826.35
Bureau of Supplies	196,626.80
Comptroller's office	523,414.32
Mails and Telegraphs	5,757,639.25
Total expenditures	45,158,061.08

The surplus was therefore expected to be 6,785,995.64 pesos. The budget of extraordinary expenditures included amortization of foreign and internal debts, 2,835,996 pesos, and construction of public works producing revenue, 28,950,000 pesos. To cover this extraordinary expenditure the Government would have the surplus from the ordinary budget and the proceeds of a loan of 25,000,000 pesos, which had already been secured.

COMMUNICATIONS. Transportation has always been a dominant economic factor in Colombia, and the lack of adequate transportation facilities, chiefly on the Magdalena River, has always accentuated depression in bad times and detracted from the effects of prosperity in good times. On Jan. 1, 1928, Colombia had 2314 kilometers of railroad in operation. The number of passengers carried in 1927 was 11,239,000; freight, 2,670,000 tons; gross receipts, 16,283,000 pesos. The one main transportation artery of Colombia, upon which many of the railways depend for freight and passengers, is the Magdalena River, which is not always navigable. The lower Magdalena River is separated from the upper Magdalena by dangerous and rocky rapids in the vicinity of the city of Honda, which is situated about 600 miles from the port of Barranquilla. From La Dorada to a point above the city of Honda, the river is quite bad, and only when the river is very high are boats able to make a continuous voyage from Barranquilla to Girardot and then boats of small size only can be used. During the wet season the river floods neighboring territory to a large extent, but during the dry season it recedes to very shallow depths. Low and high seasons are spasmodic, but as a general rule the river can be expected to be exceptionally low during the first three months of every year.

During 1927, transportation facilities were little improved, although extensions to a number of railroads increased the total mileage. The airplane service was improved by the use of larger planes, and a new service was inaugurated between the Atlantic and Pacific coasts. Of outstanding importance in transportation during the year was the official inauguration on Dec. 25, 1928, of the railroad into the city of Manizales, giving that city an all-rail route over the Pacific railroad to Buenaventura. Work was commenced on the great highway from Medellin to the Gulf of Uraba on the Caribbean coast, and the highway from Cali to Buenaventura was also started. In 1927 there were 20,000 miles of telegraph wire and 18,042 telephone instruments in use. The number of automobiles registered in 1926 was 7916.

GOVERNMENT. The executive power is vested in a president elected for four years by direct popular vote, and legislative power in a congress of two houses: the senate of 34 members, elected indirectly for four years, and the house of representatives with 92 members elected by direct popular vote for two years. President in 1928, Dr. Miguel Abadía Méndez, elected Feb. 14, 1926, for the term 1926-30.

HISTORY. It appeared during the year that the United States was to have a similar experience with Colombia over the question of oil as was experienced with Mexico in recent years. The question arose over a law of Jan. 30, 1928, which gave the Minister of Industries supreme control over the oil lands of the coun-

try. To this functionary was given the right to determine the validity of oil-land titles, which if not reasonably held would revert to the Government. He was also given the power to issue drilling permits and no decision of his was reviewable by any court of law. Of course the American oil interests immediately protested to their Government at Washington. The Colombian Government in reply to these protestations practically stated that if the American companies had a legal title to their oil lands there would be no need to protest. The American oil companies seemed to feel that there was a cordial relationship existing between the British oil interests and the Colombian Government. This the Minister of Industries vigorously denied. This action with respect to oil was an indication of the intent of the Colombian Government to either curb or wrest control entirely of its natural resources from the hands of foreign concerns.

One concession of American oil interests was cancelled and led to diplomatic intervention on the part of the State Department at Washington. When the Colombian Government replied that the matter was one between the concessionaires and itself, the United States replied to the effect that the United States, had, under ordinary usage of international law, the right to protect the property of its nationals in foreign countries and would continue to do so. This was a cause for further attack on the United States and its policy in Central America and South America in the press of those countries. Colombia's reply stated that there was nothing in the affair to cause any cessation of the friendship existing between the two countries, and that it could be settled satisfactorily to both parties. Further trouble was expected, however, when Colombia had adopted a definite policy concerning oil lands within her borders.

COLORADO. **POPULATION.** According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 939,629. The estimated population on July 1, 1928, was 1,090,000. The capital is Denver.

AGRICULTURE. The following table gives the acreage, production, and value of the principal crops in 1927 and 1928:

Crop	Year	Acreage	Prod. bu.	Value
Hay	1928	1,583,000	2,835,000 *	\$32,696,000
	1927	1,621,000	3,054,000 *	27,780,000
Wheat	1928	1,339,000	18,564,000	15,815,000
	1927	1,419,000	20,112,000	20,818,000
Potatoes	1928	110,000	18,420,000	6,089,000
	1927	96,000	14,400,000	7,920,000
Corn	1928	1,438,000	18,694,000	12,712,000
	1927	1,284,000	19,902,000	13,533,000
Dry beans	1928	309,000	1,890,000	4,726,000
	1927	281,000	1,546,000	4,174,000
Barley	1928	547,000	13,128,000	7,089,000
	1927	410,000	9,020,000	5,051,000
Oats	1928	193,000	5,953,000	2,692,000
	1927	189,000	5,481,000	2,631,000
Sugar beets	1928	179,000	2,322,000 *
	1927	218,000	2,774,000 *	21,758,000

* tons.

MINERAL PRODUCTION. Coal production, forming the chief part of the mineral industry of the State, declined somewhat in 1927, to a total of 9,724,075 net tons, as compared with 10,637,225 in 1926; in value it was \$27,044,000 for 1927 and for 1926, \$29,529,000. Gold production fell sharply to 259,111 troy ounces for 1927, from 346,297 for 1926; in value, it was \$5,356,300 for

1927 and for 1926, \$7,158,600. Silver production followed the same trend, being 3,941,351 troy ounces for 1927, and for 1926, 5,037,574; in value, \$2,234,746 (1927) and \$3,143,446 (1926). Copper output increased, being 8,006,801 pounds in 1927 as against 4,657,591 in 1926. Petroleum production was maintained in quantity, being 2,787,000 barrels for 1927, as against 2,768,000 for 1926; but in value it fell to \$2,700,000 (estimated) for 1927, from \$5,100,000 for 1926. Clay products were important, attaining \$3,381,776 for 1926, the latest year on record, as against \$4,126,945 for 1925. Stone was produced in excess of a million dollars. The total mineral production of the State in 1926 was \$65,597,487; in 1925, \$63,512,998.

The 1928 estimated production of gold from Colorado mines attained a value of \$5,243,287; that of silver was 4,131,465 ounces, in value \$2,416,907; copper, 8,119,000 pounds, \$1,185,374; lead, 54,036,000 pounds, \$3,296,196; zinc, 65,203,000 pounds, \$3,912,180. The 1928 production of all five metals was valued at \$16,053,944.

FINANCE. State expenditures in the year ending Nov. 30, 1927, as reported by the U. S. Department of Commerce, were: for maintenance and operation of departments, \$11,185,490 (of which \$803,818 was aid to local education); for interest on debt, \$620,860; for permanent improvements, \$4,340,844; total, \$16,147,194 (of which \$5,804,374 was for highways, \$2,455,574 being for maintenance and \$3,348,800 for construction). Revenues were \$16,348,420, of which property and special taxes formed 40.1 per cent; earnings of governmental departments, 13 per cent; and licenses, including gasoline tax, 30.1 per cent. Property valuation was \$1,565,290,666; State taxation thereon, \$6,010,716. The net State debt on Nov. 30, 1927, was stated at \$11,413,844.

TRANSPORTATION. The total mileage of railroad under operation on Jan. 1, 1928, was 5062.74. There were built in 1928, an additional 2.73 miles of second track.

EDUCATION. An effort to amend the State constitution in order to provide a commissioner of education to be appointed by an elected State board of education was made, and the proposal was brought to a referendum vote, but was defeated by an adverse popular vote of about 146,000 to 89,000 in favor. The proposal was favored by the State Education Association and the Parent Teachers' Association.

CHARITIES AND CORRECTIONS. The State Department of Charities, nominally the Central State organization for the control of institutions of care and custody, had no appropriation for extensive work in 1928, and its activities were limited to caring for the prison records. There were in the Colorado State Hospital on Jan. 1, 1928, 2435 sufferers from mental disorder; admittances in 1927 numbered 487, as reported by the U. S. Department of Commerce. The two State training schools for mental defectives contained in addition, on Jan. 1, 1928, 333 inmates; admittances in the preceding year having been 38. The chief institutions maintained by the State in 1928 were: State Home for Dependent and Neglected Children, Denver; State Home and Training School for Mental Defectives, Ridge and Grand Junction; Industrial School for Girls, Morrison; Industrial School for Boys, Golden; State Reformatory, Buena Vista; State Penitentiary, Canon City, State

Hospital for the Insane, Pueblo; Soldiers' and Sailors' Home, Monte Vista; Industrial Workshop for the Blind, Denver; and the State Psychiatric Hospital.

POLITICAL AND OTHER EVENTS. Governor Adams facing difficulties early in 1928 in making State income fit with expenditure, overruled a proposal to call a special legislative session for the purpose of increasing the taxes. By retrenchment, it was announced in May, a saving of some \$640,000 had been effected in the State expenditures. The difficulty thus met originated in overappropriations on the part of the legislative session of 1927. A reported application of the Public Service Company of Colorado to the Federal authorities for permission to divert 300 feet a second from the water of the Arkansas River above the Royal Gorge brought forth opposition in March from local interests concerned with the preservation of the scenic features of the Gorge. The State Supreme Court in a decision of July 9, sustained an injunction to prevent the Mountain States Beet Growers' Marketing Association from interfering with unapproved farm sale of beets to the Great Western Sugar Company. The Marketing Association, operating under the marketing laws of the State, had attempted to bind its members to a form of sale contract covering their crop for several years in advance.

The long pipe line of the Colorado Interstate Gas Company to convey natural gas to Denver from Amarillo, Texas, was put in operation in the course of the summer. The city auditor of Denver made a report in April on the finances of the municipal water supply, indicating a heavy increase in operating expenses and in bonded indebtedness over the period 1920-1927. The city authorities negotiated for the lease of the water bore of the Moffat Tunnel for use in conveying a water supply.

ELECTION. The vote of the State in the National election of November 6 was: for the Republican candidates, Hoover and Curtis, 253,872; for Smith and Robinson, Democratic, 133,131. On the vote for governor the majority was reversed, William H. Adams, Democrat, being overwhelmingly reelected, over W. L. Boatright, Republican. With the exception of Governor Adams, the Republican presidential vote carried in the Republican State ticket. Three Republicans and one Democrat were elected to the United States House of Representatives, all being the existing incumbents save one Republican, who replaced a Democrat. To the State Senate were elected 20 Republicans and 15 Democrats. Amendments to the State Constitution, for issue of \$60,000,000 highway notes, for limiting voting power in school elections, and for creating an elective State Board for Education, failed of ratification by popular vote.

OFFICERS. Governor, William H. Adams; Lieutenant-Governor, George M. Corlett; Secretary of State, Charles M. Armstrong; Treasurer, Herbert C. Fairall (appointed November 10, to succeed Harry E. Mulnix, deceased); Auditor, William D. MacGinnis; Attorney-General, William L. Boatright; Superintendent of Public Instruction, Katherine L. Craig.

JUDICIARY. Supreme Court: Chief Justice, Hasslett P. Burke; Associate Justices, John Campbell, John H. Denison, Greeley W. Whitford, Hickman Walker, John T. Adams, Charles C. Butler.

COLORADO, UNIVERSITY OF. A coeducational State institution of higher education at Boulder, Colo., founded in 1876. The number of students enrolled for the autumn term of 1928 was 2990, and the summer quarter had a registration of 3437. There were 288 faculty members, exclusive of assistants. The total income for general maintenance, from State fees, tuition, etc., was estimated at approximately \$1,195,000, while approximately \$501,000, including fees, was received for operation of hospitals, and \$125,000 for new buildings. The library contained 183,175 volumes, 17,185 pamphlets, and 2570 maps. An annual gift of \$1000 was given to the medical library (Denison Memorial Library) by the Denison Foundation. President, George Norlin, Ph.D., LL.D.

COLORADO RIVER DEVELOPMENT. See UNITED STATES, under *Seventieth Congress, Second Session*.

COLORED METHODISTS. See METHODISTS, COLORED.

COLUMBIA UNIVERSITY. A non-sectarian institution for the higher education of men and women founded in 1745. At Morningside Heights, Broadway and 116th St., New York, are located: Columbia College (for undergraduate men); the professional schools of law, mines, engineering, chemistry, and architecture; the non-professional graduate faculties of political science, philosophy, and pure science; Barnard College (for undergraduate women); Teachers College, including the departments of education and practical arts; School of Journalism; School of Business; School of Library Service; and the University Library. The College of Physicians and Surgeons and the School of Dental and Oral Surgery are on West 168th Street, the College of Pharmacy on West 68th Street; Seth Low Junior College, in Brooklyn, N. Y., and St. Stephen's College, at Annandale-on-Hudson, N. Y. In addition, through university extension and the summer session, courses are offered for resident students at Morningside Heights, and other courses are offered at Camp Columbia, as well as at several extra-mural centres.

On the basis of the enrollment on Nov. 1, 1928, the total number of resident students for the year was estimated at 36,771, distributed as follows: Undergraduates, 3683, of whom 1950 were in Columbia College, 1125 in Barnard College, 400 in Seth Low Junior College, 113 in St. Stephen's College, and 95 in other schools; graduate and professional students, as follows: graduate faculties, 2950; law, 645; medicine, 425; mines, engineering, and chemistry, 215; architecture, 105; journalism, 160; business, 440; dental and oral surgery, 250; Teachers College, 5725; pharmacy, 681; optometry, 45; library service, 215; unclassified, 225; university extension, 9800. The grand total is exclusive of 2800 duplicate registrations. Non-resident students, 12,400 in number, were estimated as follows: in home-study courses, 9000; in special and extra-mural courses, 3400. There were 14,007 registered for the summer session of 1928.

The faculty and officers of administration in 1928 numbered 2714, of whom all except 37 were in active service. This number was distributed as follows: Professors, 318; associate professors, 121; assistant professors, 219; associates, 96; instructors, 378; lecturers, 66; assistants, 204; curators, 3; instructors, lec-

turers, and assistants in Teachers College, 217; instructors and lecturers in the College of Pharmacy, 25; instructors in extension and home study, not included above, 452; instructors in summer session, not included above, 520; officers of administration, 58.

Among the appointments of the year 1928-29 were: Professors Harold F. Clark (Education), Hans T. Clarke (Biological Chemistry), Leslie C. Dunn (Zoölogy), Earl B. McKinley (Bacteriology); Director of the School of Tropical Medicine), Edmund W. Sinnott (Botany), John M. Wheeler (Ophthalmology), Jorge del Toro (Tropical Surgery), John R. Clark (Education), Goodwin L. Foster (Biological Chemistry), Michael Heidelberger (Medicine), Dudley J. Morton (Anatomy), Francis W. O'Connor (Medicine), William M. Agar (Geology), Wilfred M. Copenhaven (Anatomy), Earl T. Engle (Anatomy), and Harry O. Veach (Physiology); the appointment as visiting professors for the year 1928-29 of Professors Louis Cazamian of the Sorbonne, Paris; Alfredo Colmo, Judge of the Court of Appeals, Buenos Aires, and President of the Instituto Cultural Argentino-Norte Americano; J. J. L. Duyvendak of the University of Leiden; Douglas B. Maggs of the University of Southern California; Robert E. Mathews of Ohio State University; and Payson J. Treat of Stanford University.

Important events of the year 1927-28 included: The establishment of the new schedule of salaries; the establishment in the Borough of Brooklyn of Seth Low Junior College; the affiliation of St. Stephen's College, Annandale-on-Hudson, with the University; a new agreement with Union Theological Seminary providing a closer and more effective institutional relationship; the dedication of the Casa Italiana; the removal of the College of Physicians and Surgeons and the School of Dental and Oral Surgery to the new buildings at the Medical Centre; the establishment of a Council for Research in the Humanities; the establishment of a new dental service clinic; and the reorganization of the programme of study in Columbia College.

During 1927-28 the University received gifts in money representing a total of \$5,546,667. The principal additions to general endowment came from the estate of Amos F. Eno, \$333,584; from the estate of Mary B. Pell, \$258,185; from the Alumni Fund Committee, \$38,000. The chief additions to special endowments were: From the estate of Stephen Whitney Phoenix of the Class of 1859, \$728,009; from an anonymous donor for scientific research in physics and physical chemistry, \$368,751; from the Association of the Alumni of the College of Physicians and Surgeons to establish the Francis Delafield Alumni Professorship Fund, \$119,022; from Mrs. Walter B. James for the James Research Fellowship Fund, \$25,000; from Mrs. Henry Evans for the Evans Fellowship Fund, \$30,000; from the estate of Stella Cooper Megrue, \$25,000; from the estate of Henry Koplik, for the Koplik Children's Scholarship Fund, \$15,000; from Professor and Mrs. Frederick S. Lee, to be added to the Lee Fund, \$10,000.

The gifts for buildings and grounds included those of the Carnegie Corporation for the new buildings at the Medical School, \$373,060; those of the General Education Board for the same purpose, \$250,000; that of Frederick W. Vanderbilt and Harold S. Vanderbilt, for the construc-

tion and equipment of the Vanderbilt Clinic, \$333,333; and those from a group of friends of the university for the construction of the Casa Italiana, \$315,000. Of gifts to income, the three largest were from alumni of the university, including the estate of F. Augustus Schermerhorn of the Class of 1868, a trustee from 1877 to 1908, \$904,135; the estate of Lenox Smith, Class of 1865, a trustee from 1883 to 1913, \$56,349; and from the Alumni Federation, \$18,500.

The capital endowment in 1928, excluding value of plant (including Barnard College, Teachers College, College of Pharmacy, and St. Stephen's College), was \$69,550,071; estimated total resources, as of June 3, 1928 (including Barnard College, Teachers College, and the College of Pharmacy), was \$124,415,474; annual budget for 1928-29 (including Barnard College, Teachers College, College of Pharmacy and St. Stephen's College), was \$13,829,105. The number of volumes in the library was 1,132,236. President, Nicholas Murray Butler, Ph.D., Hon. D., LL.D., D.Litt.

COLUMBUS, GEORGIA CENTENNIAL. See CELEBRATIONS.

COLVIN, GEORGE. American educator, died at Louisville, Ky., July 22. He was born at Willisburg, Ky., Sept. 7, 1875, and was graduated from Centre College in 1895. He was admitted to the bar in 1897. For three years he was in the employ of the Louisville, Ky., Title Company, and then became superintendent of schools at Springfield, Ky., 1900-20. From the latter year to 1926 he was State superintendent of education, and then was president of the University of Louisville until his death.

CONBOY, MRS. SARA AGNES. American Labor leader, died at Brooklyn, January 7. She was born at Boston, Mass., Apr. 3, 1870, and received a common-school education. She was elected secretary-treasurer of the United Textile Workers of America in October, 1915, and was the only woman representing labor at President Wilson's conference in 1918. She represented the American Federation of Labor at the British Trades Union Congress, held in Portsmouth, England, in 1920, being the only woman ever elected as such representative, and she was one of the four women selected by President Harding to take part in the unemployment conference held in Washington in 1921. Among the other positions held by Mrs. Conboy were those of member of the executive board of the National Committee on Prisons and Prison Labor; chairman of the advisory board on vocational training in the public schools of New York, and member of the New York State Housing Commission.

CONCERTS. See MUSIC.

CONCILIATION, INTERNATIONAL. See ARBITRATION, INTERNATIONAL.

CONGO, BELGIAN. A Belgian colony in Central Africa, formerly the Congo Free State,

which was annexed to Belgium in 1908. The boundaries were defined by declarations of August, 1885, and December, 1894, and by treaties with Germany, France, Great Britain, and Portugal. Area, estimated at 918,000 square miles; the native population is placed at 8,500,000 (Bantu). On Jan. 1, 1927, the white population numbered 18,169, of whom 11,898 were Belgians. The chief city and former capital is Boma; by a royal decree of 1923, the capital was transferred to Kinshasha, which was renamed Leopoldville. Other important towns are Elizabethville, Stanleyville, and Koquilhatville. Catholic and Protestant bodies carry on missionary work, the number of Catholic missionaries being 1076 and of Protestant, 616. In coöperation with the Government they supply means of education, and there are several educational institutions under direct government control, at the more important towns. In 1927, the Government grant for education to the missionaries amounted to 3,127,892 francs, while the total expenditure on education was 11,242,598 francs.

COMMERCE, FINANCE, ETC. Total imports for consumption during 1927 reached 649,585 metric tons valued at \$41,599,000, as compared with 631,584 tons valued at \$42,158,000 for the preceding year. Exports rose from 203,678 metric tons valued at \$23,775,000 in 1926 to 223,266 tons valued at \$29,336,000 in 1927. Exports of copper ore, lumber, cotton, sesame, beans, plantation rubber, raw hides, and coffee showed especially large percentage increases, while notable advances were also made in shipments of palm nuts, copper bars, rice, and corn. The only important decreases were in exports of copal, tin ore, wax, worked ivory, horns, and gold bullion. Imports from Belgium represented 36.7 per cent of the total volume and 54.8 per cent of the total value of arrivals, in each case slightly higher than in 1926. Exports to Belgium declined in relative importance, amounting to 46.6 per cent of the total quantity of outgoing shipments and 49.6 per cent of their total value. Exports to the United States amounted to 13,615 metric tons valued at \$1,275,000, and exceeded those to all other countries excepting contiguous African territories and Belgium. Belgian Congo imported from the United States 30,832 metric tons of merchandise valued at \$2,433,000. The United States was in third place (following Belgium and Rhodesia) as a supplier of imports to the Congo.

The budget for 1928 provided revenues of 521,563,585 francs and expenditures of 521,241,955 francs. The debt on Dec. 31, 1927, was 1,893,050,983 francs, of which 1,770,411,383 francs were consolidated debt and 122,639,600 francs floating debt. Steamers belonging to the Government ply on the Congo in its navigable section from its mouth to Matadi, a distance of 95 miles, and government and private companies supply a transport service on the upper Congo and its tributaries. There are over 1000 miles of navigable water between Stanley Pool and Stanley Falls, and above Stanley Falls there is another section navigable for about 585 miles. On Jan. 1, 1927, there were 1023 miles of railroad open to traffic and 8818 miles of road partly suitable to motor traffic. Governor-General, Lieutenant-General Tilkens, appointed Dec. 27, 1927.

CONGREGATIONALISM. A religious de-

nomination founded in the United States by the Pilgrims at Plymouth, Mass., in 1620, under the leadership of Brewster, Bradford, and Winslow. The origin of this movement lay in the Separatist activity in England. The Puritans of Massachusetts Bay followed a similar tendency, and as a result the essential elements of Separatism and Puritanism were combined into Congregationalism. In this denomination each church holds the right to frame its own statement of belief, and the policy of the denomination as a whole represents adaptation to conditions rather than accord with a theory of church government. The National Council, by which the administrative affairs of the church are carried on, has no ecclesiastical authority, but includes ministerial and lay delegates elected by the State conferences and district associations. The National Council meets biennially, the session in 1927 having been held in May, at Omaha.

Statistics of the denomination for Jan. 1, 1928, showed 5548 churches, 5609 ministers, and a church membership of 928,558; there were 3085 young people's societies, with a membership of 188,047. The Sunday-school enrollment was 742,270. The total raised for all benevolences was \$4,442,491, and the home expenses of the church were \$22,056,818. The National Benevolence Societies of the denomination include the American Board of Commissioners for Foreign Missions and the Congregational Home Boards, consisting of the following corporations unified in their operations by the election of an identical Board of Directors for all: American Missionary Association, Congregational Home Missionary Society, Congregational Church Building Society, Congregational Board of Ministerial Relief, Congregational Sunday School Extension Society, and the Congregational Publishing Society. The Annuity Fund for Congregational Ministers provides a participating plan of retiring ministers.

The American Board of Commissioners for Foreign Missions is the oldest foreign missionary society in America, having been organized June 20, 1810. On Jan. 1, 1928, there were 17 missions under 12 different flags; the stations connected with these missions numbered 98 and the outstations 1665. The missionaries holding life appointments numbered 653 and included 55 ordained men, 67 unordained men, 207 wives and 224 single women. There were also 108 associates serving for shorter periods, bringing the total number of missionaries up to 761, and the native force of workers numbered 5743. Religious services were carried on in 2492 places, although there were only 773 organized churches, with 99,912, communicants. The total church constituency had increased from 284,903, in the previous year, to 305,761; the Sunday schools numbered 1493, theological seminaries and training schools 36, with an attendance of 1493 scholars, colleges 7, with 3527 students; secondary schools 83, and primary and elementary schools totaled 1226 with 68,083 pupils. The total enrollment in schools of all grades was 85,083. There were 30 hospitals and 65 dispensaries with a staff of 51 physicians and 26 foreign nurses. Total expenditures of the Board for the year ending Aug. 31, 1927, including Woman's Boards, were \$2,166,596. Due to the continued revolutionary disturbances in mission lands during the year many missionaries were forced to withdraw from their stations,

resulting in the passing of authority and responsibility for the conduct of the work from the mission, in the case of China, to the organized Chinese church. Mission stations in India, Turkey, and Mexico reported encouraging coöperation and support, while in countries less disturbed politically, as West Africa, South Africa, and Czechoslovakia, steady progress was made.

The field of the American Missionary Association extended to the Negroes, Indians, and Highlanders in the South and Southwest; Porto Ricans; and Orientals and Indians in the West; Mexicans and Hawaiians. Statistics of the Association show that in the year 1926-27 there were 236 churches; 11,254 members; 32 schools; and 7472 pupils. Expenditures during the same period amounted to \$1,216,476.26.

The Annuity Fund for Congregational Ministers was reported to have assets totaling \$4,132,841; the membership was 2384; and annuity payments amounted to \$133,923. The Church Building Society received \$305,090.82 in 1927 for current use, the contributions for church and parsonage building amounting to \$180,939.75, and repayments on church and parsonage loans to \$250,225.76. The Church Extension Board voted 208 church grants and loans, and 37 parsonage loans, amounting to \$533,543, and paid \$589,901.90 toward 121 new churches and 39 parsonages, leaving 139 applications for grants, church loans, parsonage loans, etc., which could not be provided for.

Among the 10 theological seminaries with which the denomination was affiliated were the following: Chicago Theological Seminary; Yale Divinity School; Hartford School of Religious Pedagogy; Oberlin College; and Pacific University. There were also 41 colleges with some historical relation to Congregationalism, although a number are now underdenominational.

The accompanying table, reprinted from the *Congregational Year Book* for 1927, gives statistics of international Congregationalism.

CONGREGATIONAL CHURCHES AND MEMBERS

Countries	Churches Chapels and Stations	Members of Churches	Members of Sunday Schools
Africa *	1,229	48,716	25,678
Australia and New Zealand	514	18,919	34,099

* Repeated from last *Congregational Year Book*

* United Church. Comprises Presbyterian, Methodist and Congregational churches.

In June, 1928, a group of 1200 British Congregationalists visited Plymouth Rock, Mass., to "reconsecrate themselves to the same high and holy purposes for which their fathers had suffered." Boston, New York, Brooklyn, Providence, and other New England cities were visited during the course of their stay and in each place entertainment was provided by the members of the various Congregational churches in these cities.

The headquarters of the National Council are at 287 Fourth Avenue, New York. The officers of the National Council for 1927-29 included: Honorary Moderator, President Calvin Coolidge; Moderator, Dr. Ozora S. Davis, Chicago, Ill.; Associate Moderator, the Hon. William E. Sweet, Denver, Colo.; Secretary, the Rev. Charles E. Burton, New York; and Treasurer, Edwin G. Warner, New York. The Congregational Publishing Society maintains branches at 14 Beacon Street, Boston, Mass., and at 19 South LaSalle Street, Chicago, Ill.

CONNECTICUT. POPULATION. According to the Fourteenth Census the population of the State on Jan. 1, 1920, was 1,380,631. The estimated population on July 1, 1928, was 1,667,000. The capital is Hartford.

AGRICULTURE. The following table gives the acreage, production, and value of the principal crops in 1927 and 1928:

<i>Crop</i>	<i>Year</i>	<i>Acreage</i>	<i>Prod. bu.</i>	<i>Value</i>
Hay	1928	364,000	593,000 *	\$10,942,000
	1927	370,000	538,000 *	11,592,000
Tobacco	1928	25,000	29,750,000 *	11,071,000
	1927	23,700	28,985,000 *	10,621,000
Potatoes	1928	17,000	2,210,000	1,989,000
	1927	15,000	1,635,000	2,698,000
Corn	1928	55,000	2,310,000	3,003,000
	1927	55,000	2,090,000	2,508,000
Apples	1928	1,500,000	1,950,000
	1927	1,045,000	1,776,000
Oats	1928	15,000	405,000	284,000
	1927	15,000	480,000	331,000

* tons, ^b pounds.

MINERAL PRODUCTION. The output of minerals in the State maintained its former general character, being confined chiefly to stone, sand and gravel, clay products, and lime. Clay products in 1926, the latest year on record, attained a value of \$3,291,298, as against \$2,509,727 in 1925. The stone industry was active, yielding 2,069,920 short tons in 1926, and in 1925, 1,830,210; in value, \$2,680,849 for 1926 and \$2,655,339 for 1925. Producers sold, in 1927, 53,000 short tons (estimated) of lime, as against 61,742 in 1926; the value being, for 1927, \$602,000 approximately, and for 1926, \$695,495. The total mineral production of the State in 1926 was \$7,695,341; in 1925, \$6,755,454.

FINANCE. State expenditures in the year ending June 30, 1927, as reported by the United States Department of Commerce, were: for maintenance and operation of governmental departments, \$20,100,613 (of which \$1,581,491 was for local education); for running public service enterprises, \$81,860; for interest on debt, \$656,865; for permanent improvements, \$9,050,580; total, \$29,889,918 (of which \$11,891,370 was for highways, \$4,101,020 being for maintenance and \$7,790,350 for construction). Revenues were \$32,-

658,116. Of these property and special taxes formed 25.2 per cent; department earnings and remuneration for officers' services, 9.8 per cent; license sales and gasoline taxation, 54.0 per cent. Property valuation was \$2,554,603,534; State taxes thereon were \$1,812,953. Net State funded debt on June 30, 1927, was \$3,078,148.

TRANSPORTATION. The total mileage of railroad line under operation on Jan. 1, 1928, was 967.78. During 1928 was built 0.49 mile of additional first track.

EDUCATION. The State made an interesting move in the treatment of difficult pupils in 1928 by establishing 18 psychological clinics under the Division of Special Education and Standards, for the observation and study of pupils offering special behavior problems. The school census of the State for the academic year 1927-28 was given as 378,048. There were enrolled in the public schools 307,560 pupils, of whom 266,210 were in elementary schools and 41,350 in high schools. Expenditures of the year for public-school education, exclusive of capital outlay, totaled \$25,587,119.04. Salaries of teachers averaged: in elementary grades, \$1577.80; in high schools, \$2029.56; for all schools, \$1659.97.

CHARITIES AND CORRECTIONS. The chief agency of the State Government in 1928 in the control of institutions for the care or custody of persons was the Department of Public Welfare, a statutory board created in 1921, consisting of five 4-year appointees. Under it were a Bureau of Child Welfare and a Bureau of Adult Welfare. Other boards operating separately were the Board for the Education of the Blind, Board of Pardons, and State Tuberculosis Commission. The Department had among its functions the duty to supervise and report upon penal and reformatory institutions, those for the insane and for the feeble-minded and epileptics, 33 public hospitals, 7 State sanatoria for the tubercular, town and county almshouses, homes for the aged, and institutions for child care. Among the State institutions were: Fitch's Home for Soldiers, and the Soldiers' Hospital, Noroton Heights; State Hospitals at Middletown, capacity 2867, and Norwich, 2250; State Farm for Inebriates, capacity 60; State Prison, Wethersfield; State Farm for Women, Niantic, 192 inmates; Connecticut School for Boys, Meriden, 427 inmates; Long Lane Farm (an industrial school for girls), Middletown, 231 inmates; Connecticut Reformatory, Cheshire, 295 inmates; Mansfield State Training School and Hospital for epileptics and the feeble-minded, capacity 800; State Tuberculosis Sanatoria at Cedarcrest, 170 patients; Meriden, 169; Norwich, 222; Laurel Heights, 160; Niantic (children), 59; and the Mystic Oral School for the Deaf, 108. Figures are for Jan. 1, 1928. There were at that date 4916 mental patients in the two State hospitals and 710 in the epileptic and feeble-minded institutions.

POLITICAL AND OTHER EVENTS. Important additions to the State lands, made by purchase subsequent to July, 1925, were reported in April to have brought the total area of State forest to more than 40,000 acres. The State law imposing a transfer tax on decedents' stocks and intangible property outside the State was upheld in a decision of the Federal Supreme Court in relation to the Robert B. Hirsch estate, involving a large interest in a New York partnership. The Olin Memorial Library at Wesleyan University, an \$800,000 structure donated in memory of

Photo by Richard Averill Smith

WAR MEMORIAL
NEW BRITAIN, CONNECTICUT
H. Van Buren Magonigle, Architect

Stephen B. Olin, was dedicated May 17. Suit brought by the State of Connecticut in the United States Supreme Court against the State of North Carolina, to recover about \$290,000 on repudiated bonds of the latter State, which had been donated to a State-owned Connecticut hospital, was withdrawn in May by Connecticut. At Groton, the State made arrangements for the purchase of land for an airport, from the Plant estate. Purchasers of Connecticut Valley tobacco announced early in the year a plan whereby they would purchase growers' crops in advance of the growing season, at a set price to the pound. A movement to preserve the Mark Twain residence at Hartford was set on foot in May.

ELECTION. In the presidential election of November 6, Hoover (Rep.) obtained 296,614 votes; Smith (Dem.) 252,040. The cities of Hartford, Bridgeport, Waterbury, and New Haven gave majorities for the Democratic ticket, but were overwhelmed by the predominant Republican vote elsewhere. Frederick C. Walcott, Republican, was elected United States Senator for the ensuing regular term, defeating Augustine Lonergan, Democrat. Governor John H. Trumbull was reelected, on the Republican State ticket, defeating the Democratic nominee, Charles G. Morris.

OFFICERS. Governor, John H. Trumbull; Secretary of State, Francis A. Pallotti; Treasurer, Ernest E. Rogers; Comptroller, F. M. Salmon; Attorney-General, Benjamin W. Alling.

JUDICIARY. G. W. Wheeler, Chief Justice, Supreme Court of Errors; W. M. Maltbie, F. D. Haines, G. E. Hinman, John W. Banks, Associate Judges.

COOLBRITH, INA DONNA. American poet, died at Berkeley, Calif., February 29. She was born in Illinois in 1843. In early childhood she was taken across the overland trail by her parents. She attended the public schools of Los Angeles, Calif., and in 1874 became librarian at the Oakland, Calif., Public Library, where she remained until 1893. From 1897 to 1899 she was librarian of the Mercantile Library, San Francisco, and from 1899 to 1906 librarian of the Bohemian Club of the same city. She spent several years in study and work in New York. In early life she saw much of the mining camps of California, and her experiences were embodied in some of her poems. For a time she was associated with Bret Harte in editing the *Overland Monthly*. Miss Coolbrith was the last of the coterie of early San Francisco writers which included, besides Harte, such men as Mark Twain, Charles Warren Stoddard, and Joaquin Miller. She was called sometimes "The Sappho of the West," and her work gained for her the official title of "Poet Laureate of California," conferred on her by the legislature and the Governor in 1915. Her best-known poems are contained in two volumes, *A Perfect Day and Other Poems* (1884), and *The Singer of the Sea; Songs from the Golden Gate* (1895).

COOLIDGE, ARCHIBALD CARY. American educator, historian, and diplomat, died at Boston,

Mass., January 14. Born at Boston, Mar. 6, 1866, he was graduated from Harvard in 1887, and studied also at the University of Berlin, L'École des Sciences Politiques in Paris, and at Freiburg in Baden. He was acting secretary to the American legation at St. Petersburg, 1890-91, private secretary to his uncle, T. J. Coolidge, Minister to France, in 1892, and secretary to the Legation in Vienna in 1893. From that year until his death he was connected with Harvard University, but this connection was interrupted at times by public service. In 1893-99 he was instructor in history, from 1899 to 1903 assistant professor, and thereafter professor; in 1911 he became also director of the library of the university. In 1916 Harvard conferred on him the degree of LL.D. Professor Coolidge was a member of the Taft party to the Philippine Islands in 1905-06. Harvard lecturer at various French universities, including the Sorbonne, 1906-07, and American exchange professor at the University of Berlin, 1906-07. He was sent as special agent of the United States Department of State to Sweden and northern Russia in 1918, and in the following year he was head of the mission, attached to the peace conference, which spent five months at Vienna and three months at Paris. In 1921 he became a member of the American Relief Administration in Russia. Professor Coolidge was the author of *The United States as a World Power* (1908); and *The Origins of the Triple Alliance* (1917); and was a contributor to *The American Historical Review* and other publications, and editor of *Foreign Affairs*.

COOLIDGE DAM. See DAMS.

COÖPERATION. As has been noted before in the YEAR BOOK, the history of coöperation in the United States is not spectacular. Progress is to be reported annually, but the idea has not yet seized the imagination of the American people to nearly the same degree that it has European nations. There follows a tabulation of the sales and net profits of a group of the larger consumers' coöperatives. The *Monthly Labor Review* declares that among these should be numbered the students' coöperative societies of Princeton and Harvard Universities, each of which reports annually sales in excess of half a million dollars.

SALES AND NET PROFIT OF CERTAIN OF THE LARGER CONSUMERS' COÖPERATIVE SOCIETIES

<i>Society and location</i>	<i>Sales 1927</i>	<i>Net profit 1927</i>
Franklin Coöperative Creamery Association, Minneapolis, Minn.	\$3,341,740	\$67,499
Coöperative Central Exchange, Superior, Wis. (wholesale) ..	1,255,676	18,335
Soo Coöperative Mercantile Association, Sault Ste. Marie, Mich.	602,847	39,886
Coöperative Trading Co., Waukegan, Ill.	579,618	24,136
Consumers' Coöperative Services, New York City	530,156	34,611
Cloquet Coöperative Society, Cloquet, Minn.	516,278	16,980
Coöperative Trading Association, Brooklyn, N. Y.	428,121	11,730
Coöperative Bakers of Brownsville, Brooklyn, N. Y.	394,793	6,837
New Coöperative Co., Dillonvale, Ohio	372,199	11,216
United Coöperative Society, Maynard, Mass.	338,488	12,589
United Coöperative Society, Fitchburg, Mass.	332,746	10,949
Work People's Trading Co., Virginia, Minn.	316,877	11,226

AGRICULTURAL COÖPERATIVES. A survey made by the Bureau of Agricultural Economics for the year 1925 and published in 1928 found that there were in existence in the United States 10,803 agricultural coöperatives with a total of 2,700,000 members. The following States reported the largest membership: Minnesota, 217,400 (8.1 per cent of the total in the country); Kentucky, 194,700 (7.2 per cent); Iowa, 179,800 (6.7 per cent); Missouri, 170,600 (6.3 per cent); North Carolina, 139,900 (5.2 per cent); Illinois, 131,000 (4.8 per cent); Michigan, 128,300 (4.7 per cent); Wisconsin, 120,100 (4.4 per cent); Ohio, 115,300 (4.3 per cent); New York, 100,000 (3.7 per cent).

An example of the intensive degree to which some agricultural areas are organized on co-operative lines was revealed in a study made by the U. S. Department of Agriculture in two counties in Minnesota. In the four townships that were visited it was found that 68 per cent of the 404 farmers were members of coöperative associations. Of the total, 266 were buying and selling their products through coöperatives, 191 were members of coöperative creameries, 143 of livestock shipping associations, 87 of coöperative elevator companies, and 50 of coöperative oil associations. One-half of the farmers belonged to one association, 41 per cent belonged to two associations, 7.5 per cent belonged to three associations, and 1.1 per cent belonged to four associations.

That the Government's attitude toward agricultural coöperatives was one of continued friendliness was indicated in the speech of President Coolidge before the National Grange at Washington on November 16. Here he pointed out that the most successful method devised by the farmers themselves for meeting the problem of agricultural over-production was the creation of the coöperative society. The society was a "movement to unify all the agencies of production, distribution, and consumption so that they can function as a coördinated whole which will sell at the right place and at the right time. . . . It rests on the sound merchandising principle of taking the product and disposing of it in the most advantageous way that shrewd and orderly marketing affords. Such further assistance as is necessary to render this effort more effective through setting up a board for its administration, supplied with sufficient funds to demonstrate its soundness in its experimental stage, may well be provided by the National Government."

See also under **AGRICULTURE; AGRICULTURAL EXPERIMENT STATIONS; AGRICULTURE, U. S. DEPARTMENT OF, Coöperative Marketing.**

LABOR BANKS. There were, on June 30, 1927, 28 labor banks in the United States with a combined capitalization of \$7,437,500, combined deposits of \$98,165,834 and combined total resources of \$114,717,643. The most important of these was the Federation Bank and Trust Co. of New York which had total resources of \$21,168,585. The Amalgamated Bank of New York had total resources of \$11,209,688.

The other banks were the following:

Engineers National Bank of Cleveland; Telegraphers' National Bank of St. Louis; Labor Coöperative National Bank of Paterson, N. J.; Brotherhood of Railway Clerks National Bank, Cincinnati; Mt. Vernon Savings Bank, Washington; Labor National Bank of Newark; Engineers National Bank of Boston; Amalgamated Trust and Savings Bank of Chicago; Brotherhood Coöperative National Bank of Spokane; Brotherhood Coöperative National Bank of Tacoma;

Brotherhood Coöperative National Bank of Portland; Transportation Brotherhoods National Bank of Minneapolis; Labor National Bank of Jersey City; Brotherhood National Bank of San Francisco; People's Coöperative State Bank of Hammond, Ind.; American Bank of Toledo; Brotherhood Bank and Trust Co. of Seattle; Farmers' and Workmen's Savings Bank, Jackson, Mich.; Nottingham Savings and Bank Co., Cleveland; Hawkins County Bank, Rogersville, Tenn.; Labor National Bank, Great Falls, Mont.; United Labor Bank and Trust Co., Indianapolis; Gary Labor Bank, Gary, Ind.; Labor Bank and Trust Co., Houston; Labor National Bank of Three Falls, Mont.; Brotherhood State Bank, Spokane.

BUILDING AND LOAN ASSOCIATIONS. From June 30, 1926, to June 30, 1927, the number of building and loan associations increased by 274, the membership by 670,556, and the resources by \$844,458,644. There were 21 failures during the year. The report of the United States League of Local Building and Loan Associations indicated that the money market had been so easy during the year surveyed that societies were placed in that position where they had to use salesmanship to obtain borrowers. This was largely due to the very keen competition being offered by national banks, life insurance companies, etc. During the year 1926-27, there were 12,804 associations in the United States with a total membership of 11,336,261 persons and total assets of \$7,178,562,461. In Illinois there were 910 societies with total assets of \$388,097,831. In Maryland, there were 1210 societies with total assets of \$210,000,000. In Massachusetts, there were 221 societies with total assets of \$478,005,147. In New Jersey, there were 1536 societies with total assets of \$886,167,505. In New York, there were 313 societies with total assets of \$349,533,632. In Ohio, there were 827 societies with total assets of \$1,035,429,317. In Pennsylvania, there were 4427 societies with total assets of \$1,245,987,953.

CREDIT UNIONS. In the United States one of the most successful phases of the coöperative movement has been the development of credit unions. The *Monthly Labor Review* points out that credit unions among postal workers, started only in 1923, by April, 1928, already numbered 168 societies. These had a total of 19,098 members, a paid-in share capital of \$1,179,293, a total of \$1,201,023 loans outstanding, and a grand total of \$4,160,262 loans having been granted.

GASOLINE COÖPERATIVES. Mention has already been made of the growth of coöperatives for the purchase of gasoline and oil among the farmers of the Middle West. In the States of Illinois, Nebraska, and Minnesota these organizations appeared to be particularly popular. For instance, in Illinois during 1926-28 there were formed 19 farmers' coöperative oil stations of which 14 were banded together in a central purchasing unit called the Illinois Farm Supply Co. Similarly, in Nebraska a central organization called the Farmers' Union State Exchange was purchasing oil and gasoline for 14 local groups. In Minnesota, too, there was a central unit called the Minnesota Co-op Oil Co. In the eight months from its founding in March, 1927, to December, 1927, the parent society did business totaling \$257,654, selling its oil products to some 30 local coöperative societies.

FOREIGN ITEMS. In Canada there were reported 961 societies with a total membership of 455,793. The largest single group were the livestock co-operatives with 197 societies and 286,403 members. Consumers' societies totaled 21 with 7804 members while banks in Quebec totaled 122 with 33,279 members. During 1925 these banks made

loans of \$3,909,790. In *France*, the latest figures obtainable, i.e., those for 1924, showed that there were in existence 3648 societies with a membership of 2,152,702. These did business during the year for a value of 2,144,514,249 francs. In *Germany* the coöperatives continued to flourish. For the year 1926 the Central Union reported 1093 member societies with 3,197,751 members and a total business of 1,052,697,751 marks of which 240,549,392 marks represented the value of goods manufactured. Belonging to the wholesale society there were 888 coöperatives which did 294,173,971 marks' worth of business. In *Germany* more than 60 per cent of the people belonging to the coöperatives, unlike the members in the United States and Canada, are members of the working classes, while only 5.6 per cent are tradespeople and 3.3 per cent are farmers.

In *Great Britain* the reports show a similar steady progress. In 1927 sales totaled more than £200,000,000, and £22,000,000 was distributed as surplus. The British coöperatives are ever opening new fields for their activity. In 1926, for example, the Coöperative Wholesale made large loans to similar organizations in European countries for the purpose of permitting them "to effectively market their produce without exploitation." The coöperatives of Manchester and the surrounding country run the largest laundry in the world, while in London plans were under way for the construction of a 100-bed hotel. Figures for productive coöperatives show that in 1925 there were 42 such organizations making clothing, shoes, printing, and other wares with a total membership of 14,261 persons and sales aggregating £2,285,358.

Russia outdistanced all other countries and its great strides are a matter of only five years. Says one authority: "The coöperative movement plays a greater part in the business life and social and political education of the nation than in any other country." For example the consumer coöperatives serve 30 per cent of the trade of the country and include among their membership one-fourth of the peasantry, 60 per cent of all the trade unionists, and 75 per cent of the transport workers. The accompanying figures will be of interest.

found the prices of the retailers were 2.5 per cent higher and in neighborhoods where the retailers were to be found alone prices were 4.3 per cent higher. When it is considered that in 1927 the coöperatives also gave rebates of 3 per cent on sales it is obvious that the savings effected are considerable. In 1927 rebates on sales totaled 21,637,959 francs. During 1926-27 there were 55 consumers' societies and 25 productive societies affiliated with the union. The consumers' societies had a total membership of 298,119 persons, total sales of 677,143,921 francs, paid-in share capital of 9,665,148 francs, saving deposits of 223,604,164 francs, and paid out in rebates 21,637,959 francs.

COÖPERATION IN LATIN COUNTRIES. During the year there was published Charles Gide's *La coöperation dans les pays latins—Amérique Latine, Italie, Espagne, Roumanie*. In view of the leading rôle that the author had played in the coöperative movement, his observations merit extended attention. He points out that coöperation has met with phenomenal success in the northern countries, e.g., Great Britain, Germany, Russia, the Scandinavian countries, and has been only moderately successful in the southern countries, e.g., Spain, Italy, Portugal, Greece, South America, etc. In Italy there were 1,000,000 members of coöperative societies; in Rumania, 300,000; in Spain, 80,000; in Portugal, Greece, Bulgaria, Jugo-Slavia, 100,000 each. In the whole of Europe there were to be found 25,000,000 coöperators, or about 5.5 per cent of the total population. However, in Latin America, Spain, Italy, and Rumania, the coöperative population represents but 1.5 per cent of the total or one coöperator to every 15 or 16 persons (if families are included), whereas in Austria, Hungary, Switzerland, and England the ratio is one to every seven or eight inhabitants.

M. Gide attributes this state of affairs to unsettled political conditions. He says, about those "used to the spice of local political emotions and quarrels, coöperative activity appears tame, insipid; they disdain its modest elections, they lack interest in its peaceful works." The author points out that these strictures are applicable only to consumers' coöperatives. Productive coöperatives,

DEVELOPMENT OF COÖPERATIVE MOVEMENT IN RUSSIA
[Pound sterling at par = \$4.8665; exchange rate, about par]

Type of society	Number of societies	Number of members	Amount of business in—	
			1924-25	1925-26
Consumers' coöperatives	28,739	11,863,000	£400,846,560	£667,195,767
Agricultural coöperatives	59,500	7,000,000	123,656,080	224,550,264
Peasants' crafts coöperatives	13,000	756,000	43,386,243	107,619,047
Total	101,239	19,119,000	£567,888,883	£999,365,078

In 1927, in *Belgium*, there existed a total of 2228 coöperative associations, or an increase of 103 over the previous year. For the 1927 societies reporting, the following was their distribution: consumers' societies, 382; pharmacies, 14; productive societies, 524; coöperative labor societies, 38; savings and credit societies, 138; housing societies, 110; insurance, 55; marketing societies, 39; miscellaneous, 640. The Belgian Coöperative Unit, an organization of socialist societies made up of consumers and productive coöperatives, demonstrated that the prices of the coöperatives were considerably lower than those prevailing among private retailers. In the neighborhoods where both types of stores were to be

on the other hand, thrive in Italy, Spain, and Rumania. In Italy, agricultural labor associations, rural credit associations, associations of unskilled laborers who work on public developments, are prospering; Spain has its coöperative fishers' associations, etc., etc. But the consumers' societies have not succeeded because they are the most difficult of all. "The other reforms of coöperation are the primary school of coöperation, it is the superior form and in the evolution of coöperative forms it is generally the last to appear." See AGRICULTURAL EXTENSION WORK; AGRICULTURE.

COPLIN, WILLIAM MICHAEL LATE. American physician and leader in public hygiene, died at

Atlantic City, N. J., May 30. He was born at Clarksburg, W. Va., Nov. 1, 1864, and was educated at Mount Union College and the Jefferson Medical College, Philadelphia, Pa., receiving his medical degree from the latter institution in 1886. In 1896 he became professor of pathology and president of the faculty of the college, and was professor emeritus at the time of his death. From 1892 Dr. Coplin was pathologist to the Philadelphia Hospital. He was director of the department of public health and charities of Philadelphia, 1905-07, and medical director of the Jefferson Hospital, 1907-12. During the World War he served in the United States Army as head of a base hospital in France. He had an international reputation as an authority on hygiene and sanitation. Dr. Coplin wrote: *Manual of Pathology* (5th ed., 1911), and *Text-Book of Practical Hygiene* (two editions).

COPPER. In 1928 the outstanding feature of the copper industry, according to the U. S. Bureau of Mines, was the heavy domestic withdrawals made during the latter part of the year, which caused domestic withdrawals for the year to be the highest for all time, with the exception of 1918. The price of copper increased throughout the year from a monthly average of 13.96 cents a pound in January, to 15.9 cents a pound in November and approximately the same in December, according to the *American Metal Market*. Demand, followed by the highest prices that had been paid since April, 1923, brought forth a response from the mines in the form of largely increased production. Smelter production from domestic ores increased about 10 per cent during the year, and that this increase is largely owing to heavy production in the latter part of the year, was shown by the estimate of smelter production in December, 179,000,000 pounds, which was 27,000,000 pounds higher than the monthly average for the 11 months preceding. As it takes from two to three months for copper in ore mined to appear as refined copper, the increased mine production had not up to the end of the year caused as large an increase in refinery output as it had in smelter output. The increased mine production was not made soon enough to save the producers from drawing largely on their stocks of refined copper to satisfy consumption, and refined stocks were depleted during the year from 171,000,000 pounds at its beginning to estimated stocks of 95,000,000 pounds on December 31. The drop in imports of refined copper and the increase in exports caused a further depletion of refined stocks. Blister stocks also were decreased in 1928. See FINANCIAL REVIEW.

The output of recoverable copper by the mines in the United States in 1928 was about 905,500 short tons as compared with an output of 824,980 tons in 1927, an increase of about 10 per cent, according to the Bureau of Mines' figures.

There were increases in production in all of the more important copper-producing States due to the increase in the price of copper during the year. Production fell off in Alaska and California.

The smelter production of copper from domestic ores in 1928 as determined by the Bureau of Mines from reports of the smelters showing actual production for 11 months and estimated production for December, was 1,849,000,000 pounds, compared with 1,684,000,000 pounds in 1927. The 1928 production was 10 per cent higher than that of 1927, and was the largest peace-time production on record. The estimated smelter production from domestic ores for December as reported by the smelters was 179,000,000 pounds which is 27,000,000 pounds higher than the average for the 11 months preceding.

The production of new refined copper from domestic sources, determined in the same manner as smelter production, was about 1,763,000,000 pounds, compared with 1,719,000,000 pounds in 1927. In 1928 the production of new refined copper from domestic and foreign sources amounted to about 2,470,000,000 pounds, compared with 2,326,000,000 pounds in 1927, an increase of 144,000,000 pounds or 6 per cent. The production of secondary copper by primary refineries increased from 210,000,000 pounds to about 240,000,000 pounds in 1928, or 30,000,000 pounds, so that the total primary and secondary output of copper by the refineries was nearly 7 per cent higher in 1928 than in 1927, being about 2,710,000,000 pounds compared with 2,536,000,000 pounds.

The imports of unmanufactured copper during 1928, according to the Bureau of Foreign and Domestic Commerce, amounted to 787,073,640 pounds, a monthly rate of 65,590,000 pounds compared with 718,322,990 pounds for the entire year 1927, a monthly rate of 60,000,000 pounds.

The exports of metallic copper during the calendar year 1928 amounted to 1,123,747,090 pounds compared with 1,076,729,246 pounds exported during the year 1927. In 1928, 948,309,890 pounds of refined copper in ingots, bars, rods, and other forms, were exported. Of this quantity Germany received 206,549,919 pounds, the highest amount, the United Kingdom was next with 185,816,840 pounds, and France was third with 171,440,871 pounds. In the year 1927 Germany received the largest amount, 221,841,647 pounds, the United Kingdom was next with 182,565,499 pounds, and France was third with 111,957,106 pounds.

Refineries reported that at the end of 1928 approximately 95,000,000 pounds of refined copper were in stock, a decrease from 171,000,000 pounds at the end of 1927. It was estimated that stocks of blister copper at the smelters, in transit to refineries, and at refineries, and materials in

NEW REFINED COPPER WITHDRAWN FROM TOTAL YEAR'S SUPPLY ON DOMESTIC ACCOUNT, 1927-1928, IN POUNDS

	1927	1928
Refinery production of new copper from domestic sources.....	1,719,000,000	1,763,000,000
Refinery production of new copper from foreign sources.....	607,000,000	707,000,000
Imports of refined copper (December, 1928, estimated)	103,000,000	70,000,000
Stocks of new refined copper on January 1	146,000,000	171,000,000
	2,575,000,000	2,711,000,000
Exports of refined copper (ingots, bars, rods, or other forms, December, 1928, estimated)	981,000,000	1,028,000,000
Stocks, December 31	171,000,000	95,000,000
	1,152,000,000	1,123,000,000
Total withdrawn on domestic account	1,423,000,000	1,588,000,000

process of refining, would be about 378,000,000 pounds on December 31, compared with 401,000,000 pounds at the end of 1927, a decrease of 23,000,000 pounds. Therefore, a decrease of 99,000,000 pounds in total smelter and refinery stocks was indicated.

The quantity of new refined copper withdrawn on domestic account during the year was about 1,588,000,000 pounds, compared with 1,423,000,000 pounds in 1927, an increase of 165,000,000 pounds or approximately 12 per cent. Domestic withdrawals in 1928 were the highest ever recorded with the exception of those in 1928. The method of calculating domestic withdrawals is shown in the table on page 188.

According to the American Bureau of Metal Statistics, the world's production of copper in 1928 was estimated at 1,916,471 tons, making a world record and compared with the 1927 production of 1,674,818 tons, the previous record. This authority gave the United States production for 1928 as 1,060,094 tons, a high record that could be compared with 971,123 tons in 1926, the previous record, and 847,419 tons in 1927. Chile was the next largest producer with an estimated production of some 300,000 metric tons, a high record. See METALLURGY.

COPYRIGHT. Registrations for the fiscal year 1927-28, according to the report of the United States Registrar of Copyrights, numbered 193,914, as compared with 184,000 for the preceding year. Of these 77,081 were classed as books, but included pamphlets, leaflets, and contributions to periodicals, those printed in the United States numbering 70,972, those printed abroad in a foreign language, 4405, while the remainder, 1704, were English books registered for ad interim copyright. The chief classes of the remaining registrations, in order of numerical importance, were: Periodicals, 47,364 numbers; musical compositions, 26,897; prints and pictorial illustrations, 14,272; photographs, 7968; dramatic or dramatico-musical compositions, 4473; works of art, including models or designs, 3152; maps, 2862; drawings or plastic works of a scientific or technical character, 1705; motion-picture photoplays, 1288; and motion pictures not photoplays, 1016. The renewals numbered 5447 as compared with 4686 in the preceding year. The fees paid during the year amounted to \$195,167.65. The total number of articles deposited during the fiscal year ended June 30, 1928, was 310,209.

The gross receipts of the Registrar's office for the fiscal year were \$201,054.49; the total expenditure for salaries, \$182,959.53; and for supplies, \$1,495.64. The year's business showed a substantial increase over that of 1927, which was the largest in the history of the office up to that time.

Copyright legislation was enacted, May 23, 1928, to increase the copyright fee for registration of all published works to \$2. This fee was formerly \$1. The fee for an unpublished work remains at \$1. Fees for most other copyright services have been correspondingly increased. It was stated by the United States Registrar of Copyrights that one copyright proclamation had been issued during the year, namely, in behalf of citizens of Rumania, May 14, 1928, including protection with respect to the mechanical reproduction of music, under Sec. 1 (e) of the Copyright Act of 1909.

CORN. The production of corn in 1928 of 15 countries reporting to the International Institute of Agriculture, Rome, was estimated at 3,224,801,000 bushels as compared with 3,281,590,000 bushels in 1927. This represented an increase of 0.9 per cent in 1928 over the yield in 1927 and a decrease of 1.7 per cent from the average yield for the five years 1922-26. The area devoted to the crop in 1928 was reported as 128,234,000 acres, or 3.3 per cent above the 1928 acreage and 2.5 per cent above that of the five-year period.

The 1928 production in some of the more important European corn producing countries was reported as follows: Rumania, 99,874,000 bushels; Kingdom of the Serbs, Croats, and Slovenes, 81,214,000 bushels; Italy, 62,285,000 bushels; Hungary, 43,325,000 bushels; Spain, 23,877,000 bushels; and Bulgaria, 18,293,000 bushels. Owing to dry weather in central European countries, the European crop was nearly 100,000,000 bushels below the crop of 1927 and 185,000,000 bushels below the five-year average of 1923-27. For the crop year 1927-28, the following yields were reported by the leading corn growing countries of the southern hemisphere: Argentina, 306,000,000 bushels; Union of South Africa, 69,000,000 bushels; and Australia 10,000,000 bushels. Brazil for the three years 1924-26 produced an average yearly yield of 162,600,000 bushels.

The production of Canada in 1928 was reported as 4,692,000 bushels on 139,000 acres, which was over 10 per cent more than the production in 1927 but nearly 60 per cent below the five-year average of 1922-26. Largely owing to the damage caused by the corn borer in the Province of Ontario, the Canadian acreage the past two years was reduced to about one-half the area grown in earlier years. The average annual yield for the five-year period was 11,556,000 bushels.

The corn production of the United States, according to estimates published by the Department of Agriculture on Dec. 14, 1928, was 2,839,959,000 bushels on 100,761,000 acres, the rate per acre being 28.2 bushels. In 1927 the yield was 2,763,093,000 bushels, the area 98,393,000 acres and the average yield per acre 28.1 bushels. On the basis of the average farm price Dec. 1, 1928, which was 75.1 cents per bushel, the total value of the crop was \$2,132,991,000 as against \$1,997,759,000 in 1927 when the corresponding price was 72.3 cents per bushel. The highest-producing States and their yields in 1928 were as follows: Iowa, 476,012,000 bushels; Illinois, 367,488,000 bushels; Nebraska, 212,701,000 bushels; Missouri, 181,540,000 bushels; Kansas, 179,118,000 bushels; Indiana, 161,322,000 bushels; Minnesota, 143,115,000 bushels; and Ohio, 136,725,000 bushels. All other States reported yields of less than 100,000,000 bushels.

The following States reported the highest acreages: Iowa, 11,174,000 acres; Illinois, 9,570,000 acres; Nebraska, 8,937,000 acres; Kansas, 6,634,000 acres; Missouri, 6,260,000 acres; Texas, 4,722,000 acres; Indiana, 4,583,000 acres; and South Dakota 4,469,000 acres. The average yield per acre ranged from 10.5 bushels in Georgia to 46 bushels in Idaho. In the leading States above mentioned the range in average yield per acre was from 23.8 bushels in Nebraska to 42.6 bushels

in Iowa. The eastern Corn Belt States showed a much larger production of corn in 1928 than in 1927, while the cotton States showed a marked reduction. The average farm price per bushel in the different States on Dec. 1, 1928, ranged from 61 cents in North Dakota to \$1.35 in Rhode Island. In only 20 States was the price a dollar or higher. The range in the eight highest-producing States was from 62 cents to 76 cents per bushel.

A report on the utilization of the corn crop of 1927 in the United States, made by the Department of Agriculture, indicated that 2,320,343,000 bushels were produced for grain, 30,312,000 tons for silage, and 11,055,000 acres were used for hogging down, grazing, and forage. Approximately 84 per cent of the acreage was devoted to grain production, 4 per cent to silage production, and 11 per cent to grazing and other purposes. The results of another study made by the department indicated, on the basis of reports from 4778 farms, that the average cost of production in 1927 in the United States was 70 cents per bushel of ear corn. A comparison of production costs for the six years 1922-27 showed that the annual cost of producing an acre of corn varied from \$23.01 in 1922 to \$24.97 in 1925 and the cost per bushel from 66 cents in 1922 to 84 cents in 1924. In the West North Central and Western States, where the yields were relatively good in 1927, the cost of production was 11 cents and 9 cents less than in 1926; and in the East North Central and South Central States, with yields lower than in 1926, the cost per bushel was 7 cents higher.

The international market situation in the fall of 1928, in view of the reduced crop in Europe, the relatively high prices for Argentine corn and the low stocks of old corn on hand seemed to indicate fair prices in the United States. The stock of corn on farms in the United States Nov. 1, 1928, was only 53,939,000 bushels, or 1.9 per cent of the total crop and the lowest since 1917. During the fiscal year ended June 30, 1928, the United States exported 18,374,000 bushels of corn, 259,000 barrels of cornmeal and 7,240,000 pounds of corn products for table use. The imports during the same period amounted to 5,463,000 bushels.

Research work was continued during the year by the Department of Agriculture, the agricultural experimental states, and other agencies to provide a better and greater utilization of farm waste materials, including those of the corn crop. An estimate of the supply of farm wastes, made in this connection, placed the annual production of corn stalks in the United States at 100,000,000 tons and of corn cobs at 20,000,000 tons. Farmers located in the areas invaded by the European corn borer, especially in Ohio and Michigan, are modifying their methods of corn growing and utilization, in addition to clearing up their fields to keep the pest in check. The extra labor involved in the control of the borer tends to change cropping systems and methods and in many instances to reduce the acreage. See ENTOMOLOGY, ECONOMIC.

The national corn-husking championship in 1928 was won by Walter Olson of Illinois, who husked 26.62 bushels in 80 minutes. As announced by the College of Agriculture, Ohio State University, Ira Martin, an Ohio farmer, broke his own three-year record as world champion corn grower by producing in 1928, 1762 bushels on 10

acres as compared with 1686.6 bushels in 1926, his previous highest yield.

CORN BORER, EUROPEAN. See AGRICULTURAL EXTENSION WORK; AGRICULTURE; CORN; ENTOMOLOGY, ECONOMIC.

CORNELL UNIVERSITY. A non-sectarian institution for the higher education of men and women at Ithaca, N. Y.; founded in 1865. There were 5387 students enrolled in the autumn session of 1928, distributed as follows: Graduate school, 602; college of arts and sciences, 1901; law, 189; medicine, 257; architecture, 190; engineering, 1007; veterinary medicine, 134; agriculture, 625; home economics, 482. Of these students 1299 were women. For the summer session the registration was 2150. The faculty, composed of 1106 members, had 288 professors, 202 assistant professors, 13 lecturers, 386 instructors, and 217 assistants. The productive funds on June 30, 1928, were \$21,230,391. The income applicable to current expenses of the fiscal year was approximately \$7,000,000, including \$2,038,000 of State, and \$335,000 of Federal, appropriations. Gifts amounting to \$4,034,500 were received in the year 1927-28. The lands and buildings were valued at \$10,576,000 and the equipment at \$4,030,800. The library contained 780,000 volumes.

Appointments to the faculty included those of Madison Bentley of the University of Illinois, who succeeded the late E. B. Titchener in the Sage professorship of psychology, and Mortimer W. Raynor and William L. Russell as professors of psychiatry in the medical college (New York City); Prof. T. F. Tout of the University of Manchester was the Messenger lecturer on the Evolution of Civilization, while the George Fisher Baker non-resident lecturers in chemistry were Prof. George Barger of Edinburgh and Prof. Hans Pringsheim of Berlin. The faculty lost by death the following professors: T. F. Crane, Romance languages, emeritus; I. P. Roberts, agriculture, emeritus; N. M. Shaffer, surgery, emeritus; F. S. Meara, medicine; and J. G. Pertsch, Jr., electrical engineering.

Building construction during the year included progress on the new \$2,000,000 women's residential halls, and some progress toward the erection of the Cornell war memorial group of men's dormitories; a new plant industry building was started; a new bridge over Fall Creek Gorge was erected; and two new bells for the Cornell chimes were installed. An appropriation of \$70,294 by the Heckscher Foundation for Research at Cornell University, and approved by the Board of Trustees, provided for 42 separate research projects to be conducted during 1928-29. The funds were to be devoted to researches in the natural sciences, particularly in chemistry and physics, including a coordinated attack on problems involved in radiation. Twenty-six tuition scholarships were awarded to students in the Cornell Law School for 1928-29, 15 of which furnished free tuition and the others half the cost of tuition. President of the University, Livingston Farrand, LL.D.

CORONA. See ASTRONOMY.

CORSON, OSCAR TAYLOR. American educator, lecturer and author, died at Columbus, Ohio, April 14. He was born near Camden, Ohio, May 3, 1857, and studied at the Ohio Wesleyan University. After teaching in country schools, 1875-78, and serving as principal of high schools

and superintendent of schools at Camden, Granville, and Cambridge, Ohio, he became, in 1892, State commissioner of common schools of Ohio. He remained in that office until 1898. In the meantime, in 1895, he had become editor of *The Ohio Educational Monthly*. He held the editorship 23 years. Dr. Corson, who received the degree of LL.D. from Wooster University in 1907, devoted his later years to lecturing and writing on education. In 1898 he was elected president of the Ohio State Teachers' Association, and in 1900 president of the National Education Association. He wrote: *Ohio State School Reports* (6 vols., 1892-98) and *Our Public Schools*.

COSMIC RAYS. See PHYSICS.

COSTA RICA. kōs'ta rēkă. A republic of Central America lying between Nicaragua and Panama, and bounded by the Caribbean Sea on the east and the Pacific Ocean on the west. Capital, San José.

AREA AND POPULATION. The area is estimated at 23,000 square miles. On May 11, 1927, for the first time in 35 years, a general population census was begun in Costa Rica, almost 800 persons being employed in the work. The last general population census made in 1892 showed the population of Costa Rica at the time to be 243,205. Official reports of the 1927 census published in the Spring of 1928 placed the total population at 471,524.

In 1926 the movement of population was: Births, 21,889; deaths, 10,813; marriages, 3705. In the same year the immigrants numbered 6402 and the emigrants, 5894. The populations of the larger cities according to the census of 1927 were as follows: San José, 50,580; Alajuela, 8496; Cartago, 14,883; Heredia, 7631; Liberia, 3161; Limón, 15,624; and Puntarenas, 7790.

EDUCATION. Primary instruction is free and compulsory, and the elementary schools are under local councils, but subventioned by the central Government. In 1926 there were 468 elementary schools open, with 1437 teachers and 42,031 pupils enrolled. The average attendance was 38,099. For secondary instruction there are at San José a lyceum for boys with 500 pupils and a college for girls with 472 pupils. The normal school at Heredia had 343 students. There are two colleges located at Cartago and Alajuela. There are also professional schools of pharmacy, law, medicine, and dentistry.

PRODUCTION. The chief occupation in the country is agriculture, although there are large areas not yet cleared that contain valuable cabinet woods. Coffee and bananas are the principal agricultural products. Cacao and sugar, once of considerable value, are playing an ever-decreasing part in the economic life of the country. The coffee exports in 1927 amounted to 16,153,980 kilos and in the same year 7,853,000 bunches of bananas were exported. The volume of banana exports reached its peak in 1913 and has steadily decreased since that time, owing to the Panama disease and the abandonment of exhausted lands. Gold and silver mining are also important industries of the country, being carried on on the Pacific coast. There are also deposits of manganese ore near the Pacific.

COMMERCE. Exports in 1927 were valued at 75,233,331 colones and imports at 65,243,136 colones, thus giving a considerable balance in favor of national exports. The imports reached the largest amount yet recorded, showing an increase of about 9,939,000 colones over those of

1926. The weight of exports was next to that of 1925, being 10,666,085 kilos, in addition to 14,279 head of cattle. The latter figure evidenced considerable increase—8190 head—over cattle exports in 1926. The United States supplied 57.6 per cent of the 1927 imports and Germany 18.7 per cent.

FINANCE. The Government of Costa Rica reported an increase in almost all classes of revenue for the year 1927, the total receipts being 30,584,123 colones as against budget estimates of 25,680,454 colones. The sources of revenue were: Custom house receipts, 16,187,155 colones; liquor tax, 5,178,840; income from National Railway, 2,563,879; revenue from banana trade, 306,032; other sources, 6,348,216. The expenditures totaled 23,319,189 colones, as against budget estimates of 23,694,641. A satisfactory surplus was therefore recorded. According to data submitted by the President in his annual message to Congress at the opening session of 1928, the public debt of Costa Rica on Dec. 31, 1927, amounted to 80,047,942 colones. This figure showed a reduction in the public debt of 7,465,184 colones over the total for Jan. 1, 1924.

COMMUNICATIONS. In 1926 there entered the ports of the Republic 679 ships of 1,304,313 tons, and cleared 676 ships of 1,303,231 tons. The length of railways was 413 miles of which 81 miles were State owned. In 1926 there were 2174 miles of roads partially suitable for motor traffic. In 1925 there were 2189 miles of telegraph wire and 2173 telephone instruments in use. In 1927 there were 1480 automobiles registered.

GOVERNMENT. The executive power is vested in a president who is elected for four years and who carries on his administration through seven secretaries of state appointed by him and responsible to him; legislative power in a chamber of representatives called the Constitutional Congress with 43 deputies, elected for four years, one-half retiring every two years. Voting for president, deputies, and municipal officers is secret, direct, and free. President at the beginning of 1928, Don Ricardo Jiménez, elected on Dec. 7, 1923; assumed office, May 8, 1924, for a period of four years. He was succeeded on May 8, 1928 by Cleto González Víquez, who was elected on Feb. 12, 1928, for the term 1928-32. On June 27, 1928, Congress approved a measure, which was later signed by the President, providing for the creation of a department of labor and social welfare, which shall have as its principal functions the following: "The preparation of a labor code setting forth regulations for labor contracts, savings and pension plans, organization of the labor office, labor associations, the housing of laborers, and conciliatory and arbitral proceedings; the organization of a service for the inspection of mines and industries, labor in general, industrial and professional instruction, and insurance and social welfare; the inspection and the execution of labor and social welfare laws; and the foundation and organization of an institute of social studies."

HISTORY. On February 12 Costa Rica held a presidential election, the two candidates being Cleto González Víquez of the National Union party and Carlos María Jiménez who was nominated by the Republicans. Señor Víquez was elected and assumed for the second time the duties of President on May 8. The new President

was born in 1858 and was educated to follow the legal profession. In the important posts of member of Congress and as Minister of Finance, Foreign Affairs, Promotion, and the Interior, he had been a valuable factor in the achievement of important legislative and administrative reforms. He served as President for the term 1906-10. Dr. Manuel Castro Quesada presented his credentials as Minister from Costa Rica to the United States on October 8.

For COSTA RICA AND MONROE DOCTRINE, see LEAGUE OF NATIONS.

COST OF LIVING. See STATISTICS.

COTTON. The Crop Reporting Board of the U. S. Department of Agriculture on Dec. 8, 1928, estimated the cotton crop of the United States for the year at 14,373,000 bales, an increase of 1,418,000 bales over the crop of 1927, and of 852,000 over the 5-year average, 1922-26. The average yield of lint per acre was estimated at 151.8 pounds, a slight decrease from the 5-year period. About 47,000,000 acres were planted to cotton in 1928, and after considerable abandonment, due to various causes, 45,326,000 acres were left for harvest. The farm value of the lint was estimated at \$1,291,589,000 and that of the seed at \$231,933,000, making the estimated total value of the crop \$1,523,512,000. On Sept. 12, 1928, *Commerce and Finance* issued an estimate of the cotton crop of the United States for 1928 as 14,152,000 bales. This followed a government estimate on September 1 of 14,439,000 bales. *Tattersall's Cotton Trade Review* for Dec. 19, 1928, estimated the hold-over of American cotton at 5,100,000 bales. This with the estimated crop of 14,373,000 bales would make a world's supply of American cotton of about 19,500,000 bales, with an estimated consumption of 14,900,000 bales.

In practically every important cotton-producing country, the area planted to cotton was about 7.5 per cent greater than in 1927, when 68,761,000 acres were planted to that crop. In many countries there were crop losses due to various causes, and it was not expected that the total crop would be greatly in excess of that of 1927. The estimated crop of India for 1928 was about 5,500,000 bales and of Egypt, 1,490,000 bales, or 21,413,000 bales for the three leading cotton-producing countries.

The U. S. Bureau of the Census estimated the world's production of commercial cotton in 1927 at 23,370,000 bales. The principal producing countries and their crops were reported by the International Institute of Agriculture at Rome as follows: United States, 12,789,000; India, 4,586,000; Egypt, 1,252,000; and Union of Soviet Republics, 983,000 bales. Anglo-Egyptian Sudan is reported to have produced 128,000, Uganda, 112,000; Brazil, 492,000; Mexico, 156,000; and Korea, 143,000 bales. The Bureau of the Census reported the crop of the United States for 1927 as 12,956,000 bales.

The accompanying table shows, by States, the cotton crop of the United States for 1927, as reported by the Bureau of the Census, the estimated crop for 1928, and the quantity reported ginned to Dec. 13, 1928:

In the accompanying table, under the ginning report, there are included 559,741 round bales that are counted as half bales. In the figures given for the estimated crop of Arizona, 22,332

States	Crop, 1927	Estimated	Reported
		Crop, 1928	Ginned, December 13, 1928
	500-lb. bales	500-lb. bales	Running bales
United States . . .	12,950,473	14,373,000	13,148,411
Alabama	1,192,262	1,090,000	1,058,696
Arizona	91,589	134,000	107,657
Arkansas	999,657	1,215,000	1,073,380
California	91,177	155,000	130,616
Florida	16,496	20,000	19,641
Georgia	1,099,568	1,020,000	1,008,925
Louisiana	547,437	685,000	675,035
Mississippi	1,355,098	1,470,000	1,392,842
Missouri	114,125	146,000	106,617
New Mexico	65,249	70,000	63,982
North Carolina	860,876	840,000	800,202
Oklahoma	1,036,606	1,180,000	1,046,532
South Carolina	729,942	725,000	711,438
Tennessee	358,755	420,000	358,095
Texas	4,354,621	5,150,000	4,551,341
Virginia	30,432	44,000	39,999
All others	6,583	9,000	3,513

bales of American-Egyptian cotton are included. The estimated crop of American-Egyptian cotton, practically all of which is grown in Arizona, is 29,000 bales. The crop of Lower California, which is usually marketed through California, is estimated at 83,000 bales, which are not included in the totals.

During the cotton year which ended July 31, 1928, there were crushed by oil mills in the United States 4,653,663 tons of cottonseed. Among the products derived from the seed were: 876,498 bales of lint; 1,319,946 tons of hulls; 2,093,127 tons of oil meal and cake; and 1,476,535,672 pounds of oil; besides a certain amount of other products.

Exports of cotton and lint for the year ended July 31, 1928, amounted to 7,733,177 bales. The consumption of domestic cotton by mills in the United States for the same period was 6,832,689 bales. The principal exports were to: United Kingdom, 1,430,539; Germany, 2,093,849; France, 895,682; Italy, 690,095; other European countries, 1,233,472; and Japan, 959,474 bales. During the same period there were imported from Egypt, 201,856; Peru, 23,319; China, 62,888; Mexico, 22,844; and British India, 20,663 bales. Of the cotton used by American mills, by far the greatest amount was consumed in mills in the cotton States, 5,113,999 bales, as contrasted with 1,435,947, in New England and 282,743 bales in all other States. Of the 36,374,000 spindles in the United States, 30,596,840 were active in November, 17,906,874 of which were located in the cotton-growing States, 11,395,480 in New England, and 1,294,846 in the other States. The percentage of idle spindles was greatest for New England and the average number of hours per spindle was likewise lowest.

Due to cold weather and excessive rains over much of the cotton area of the United States in the spring of 1928, planting was greatly delayed and in many regions extensive replanting was necessary. Drought affected the crop in parts of Texas and Oklahoma and boll-weevil damage was generally more severe than for several years past. These and other factors were responsible for a considerable abandonment, and while the area planted to cotton in 1928 was greater by 11.4 per cent than in 1927, the area harvested was about 4 per cent below that of the record crop of 1926.

The extension of cotton growing in the plateau region of northwestern Texas continued to

threaten the profitable production in some of the more humid regions. Extensive areas suited to the crop, large fields that permit machine cultivation, mechanical methods of harvesting the crop, and freedom from boll-weevil injury have favored cotton growing in this region. Low rainfall in the plateau is a hazard for cotton production, but the moisture requirement of the crop has been found less than in some lower elevations. Thirteen counties in northwestern Texas produced more than 150,000 bales in 1927 that were not reported as growing cotton in 1922. Many adjacent counties have greatly increased their production since the new methods have come into use.

The pink bollworm, which had been eradicated from areas in Louisiana and eastern Texas (YEAR BOOK, 1918, p. 160), was discovered in December, 1927, in west-central Texas near the western extension of continuous cotton culture. Quarantines were immediately established and eradication measures were undertaken for the control of this pest. Congress appropriated \$5,000,000 for putting in effect eradication methods which include the prohibition of growing cotton in the infested areas. For 1928 Texas must assume one-half the cost of losses due to the establishment of cotton-free zones.

An analysis of data on the mill consumption of cotton has shown that the United States produces too much of its crop that is very short staple and not enough middling or strict middling to meet the demand. Studies were made in Georgia and in an area in southwestern Oklahoma and adjacent Texas, and it was found that 78 per cent of the Georgia crop of 1927 was $\frac{7}{8}$ -inch or less in length and about $2\frac{1}{2}$ per cent of the entire crop was untenderable by reason of being $\frac{13}{16}$ inch or less. In the Oklahoma-Texas area 44 per cent of crop was $\frac{7}{8}$ -inch or less and 18 per cent was untenderable as being $\frac{13}{16}$ inch or less. In all of the studies middling and superior grades were found well represented, and in the Oklahoma-Texas area 11 per cent of the crop was $1\frac{1}{2}$ -inch staple. This was believed to indicate the possibility of producing better staple at little or no increase in cost. In many regions quantity rather than quality production is preferred, and the problem was to determine the combination of yield and length of staple that will give the best return to the grower. Congress provided for reports on supplies of cotton by grade and staple. This would furnish mills with information as to sources where superior fibre can be obtained and ultimately it should bring about better prices to the grower.

The cotton industry in Great Britain continued to be very unsatisfactory. Of about 38,000,000 spindles which used American cotton, only about 65 per cent were in full operation during the year. The British Cotton Growing Association, the Empire Cotton Growing Corporation, and other agencies were continuing their efforts to increase cotton production within the British Empire and thus become less dependent on the United States. In 1918-19 the cotton production of the Empire, exclusive of India, was 84,522 bales. This was gradually increased to 431,438 bales in 1925-26. The crop of 1926-27 was reduced to 361,318 bales by reason of low prices, unfavorable weather, lack of selected seed, etc. The principal producing countries and their crops for 1926-27 were: Anglo-Egyptian Sudan, 148,

118; Nigeria, 27,464; Uganda, 131,728; and Union of South Africa, 10,242 bales.

The Cotton Industry Act, which levied a tax of about 12 cents on every bale of cotton consumed by British mills, expired in July, 1928. Mills representing more than 80 per cent of the spindles in Great Britain voted in favor of a continuation of the act, and a bill which provided for a levy of 6 cents per bale was passed by the House of Commons on April 27. Under the original act, the Empire Cotton Growing Corporation was created and it was quite active in fostering research, transportation facilities, marketing, financing plantations, and other operations in connection with cotton production within the British Empire.

The Indian Cotton Cess Act of 1923, which levied a tax of 4 annas (about 8 cents), was amended in 1926 to a levy of 2 annas on every bale of cotton exported or consumed in mills in India. The funds derived under this Act are turned over to the Indian Central Committee for its work in cotton marketing, statistical, agricultural, and technological research on cotton and in the training of research workers. Considerable progress was reported by the Committee. Marketing conditions were improved and cotton crop forecasts were extended to include a number of additional provinces. It was believed that the crop data thus reported were much more accurate than in the past.

Progress was made in the improvement of Indian cottons and a beginning made in establishing grades for the more important varieties grown.

In Egypt, the Government continued to limit the area to be planted to cotton, and to supervise the management of the crop, its marketing, etc. Templeton, who had studied for five years the matter of ratooning cotton in Egypt, found some decided advantages for this method over annual planting in that country. While blooming begins about the same time for each crop, the curve of abundant blooming is in favor of the ratooned plants. The maximum of effective blooming of the ratooned plants was earlier and the crop was advanced by about six weeks, both of which are factors that are of great advantage under pink bollworm conditions as they occur in Egypt. Higher yields and less bollworm infestation were observed in most places, and there was no decrease in the quality of the line due to ratooning. Cost of production was materially reduced and pure-line strains were more readily maintained where ratooning was adopted. Important differences were found necessary in the practices adopted for irrigating ratooned and annually planted cotton. The Egyptian Government was reported to be preparing for the establishment of cotton mills to supply local demands for cloth.

Owing to the limited demand for Sea Island cotton, experiments were in progress in Fiji with various types of kidney cottons from New Guinea and two or three have been found promising. The quality of the fibre was said to be better than American middling and the crop does not require the care that is necessary for Sea Island. Practically all the Sea Island cotton produced in 1928 was grown in the West Indies, and the exports from the British West Indies from Jan. 1 to Oct. 31, 1928, were about 2700 bales.

COULTER, kōl'tēr, JOHN MERLE. American botanist and educator, died at Yonkers, N. Y., December 23. He was born at Ningpo, China, Nov. 20, 1851; graduated from Hanover College in 1870; and worked in the Rocky Mountains as botanist on the U. S. Geological Survey, 1872-73. Appointed professor of natural sciences in 1874, he remained at Hanover until 1879, when he was made professor of biology at Wabash College. Indiana University elected him president, and professor of botany in 1891, and two years later he accepted the presidency of Lake Forest University. Transferring to the University of Chicago in 1896, as professor and head of the botany department, he remained at that institution until 1925, when he became adviser at the Boyce Thompson Institute of Plant Research, at Yonkers, a post which he retained until his death. Dr. Coulter was also principal of the Bay View Summer University, 1893-96, and of the Winona Summer School, 1895-98. He was awarded Ph.D. degrees by Hanover in 1882 and by Indiana University in 1884. Besides being a member of several European and American scientific societies, he was a fellow of the American Academy of Arts and Sciences, general secretary of the American Association for the Advancement of Science in 1901, and president in 1918, and president of the Botanical Society of America, 1897-98, while he served on the National Research Council from 1923 until his death. In addition to his research and educational work, Dr. Coulter lectured frequently, being particularly interested in explaining the harmony between religion and science. Having aided in the foundation of the *Botanical Gazette* in 1875, he served as editor for many years, contributing to it and other periodicals. He supervised the botany department in the first (1903) and second (1914) editions of the *NEW INTERNATIONAL ENCYCLOPEDIA*, and wrote the following books: *Manual of Rocky Mountain Botany* (1885, rev. ed. 1909); *Manual of Texan Botany* (1891); *Plant Relations* (1899, 3d ed. rev., 1910); *Plant Structures* (1899, 2d ed., 1904); *Plant Studies* (1902, 2d ed., 1904); *Morphology of Gymnosperms*, with Charles J. Chamberlain (1901); *Morphology of Angiosperms*, with Chamberlain (1903); *A Text-Book of Botany* (1906); *Elementary Studies in Botany* (1913); *Fundamentals of Plant Breeding* (1914); *Evolution in Sex Plants* (1914); and *Plant Genetics* (1918).

COUNCIL-MANAGER PLAN. See **MUNICIPAL GOVERNMENT**.

COURTNEY, kōrt'ni, WILLIAM LEONARD. English author, editor, and critic, died November 1. He was born at Poona, India, Jan. 5, 1850, and after attending Somersetshire College, Bath, he entered University College, Oxford, in 1868, where he won scholastic honors, being elected Fellow of Merton College in 1872. He became headmaster of Somersetshire College the following year, but returned to Oxford in 1876, as fellow and philosophy tutor, at New College. While at the university he stimulated others to share his own interest in the stage, and to increase the prestige of the dramatic society by forming the "New Theatre" to replace the "Vic." He himself acted in productions at various colleges. Having contributed to the *Fortnightly* for several years, Courtney gave up teaching in 1890 and moved

to London in order to apply himself to the more congenial profession of journalism. He was first employed on the staff of the *Daily Telegraph*, later editing the paper until December, 1924. He also was made editor of *Murray's Magazine*, and of the *Fortnightly Review* in 1894, but had resigned from both positions at the time of his death. Being interested in publishing, he became director of Chapman & Hall. His dramatic and literary criticisms, which appeared for many years in the *Daily Telegraph*, secured his reputation as an authoritative critic. In addition, he wrote numerous topical articles and published a number of books, including: *Studies on Philosophy* (1882); *Constructive Ethics* (1886); *Studies New and Old* (1888); *Life of John Stuart Mill* (1889); *The Idea of Tragedy* (1900); *The Development of Maeterlinck* (1904); *The Feminine Note in Fiction* (1904); *The Literary Man's Bible* (1907); *Rosemary's Letter Book* (1909); *In Search of Egeria* (1911); *The Soul of a Suffragette* (1913); *The Literary Man's New Testament* (1915); *Old Saws and Modern Instances* (1918); *The Passing Hour* (1925); and *The Bedside Bible* (1926). Several of his plays were produced in London, notably: *Kit Marlowe* (1893); and *Undine* (1902). He was honored with the LL.D. degree by the University of St. Andrews during his service at Oxford.

COURT TENNIS. See **RACQUETS**.

COVINGTON, HARRY FRANKLIN. American educator; died at Snow Hill, Md., July 16. He was born at Snow Hill, Apr. 6, 1870. He was graduated from Princeton University in 1892, becoming in the following year assistant in oratory. From 1898 to 1904 he was assistant professor of oratory, and from 1904 to 1911 assistant professor of English. In 1911 he became professor of public speaking and debate. He was a member of the National Association of Teachers of Speech and of the Eastern Public Speaking Conference, and associate editor of *The American Journal of Public Speaking* and of the quarterly *Journal of Speech Education*. In 1918 he published *The Fundamentals of Debate*.

COWS. See **DAIRYING**; **LIVESTOCK**.

CRANE, FRANK, American journalist and clergyman, died at Nice, France, November 5. He was born at Urbana, Ill., May 12, 1861, and attended Illinois Wesleyan University. Having been ordained into the Methodist Episcopal ministry in 1882, he preached in various parishes serving as pastor of the Trinity and the Hyde Park Methodist Episcopal churches of Chicago, from 1896 to 1903. He joined the Congregational Church in 1904, becoming pastor of the Union Congregational Church, of Worcester, Mass., where he preached until he retired from the ministry in 1909. He then lectured and commenced contributing short daily sermons to newspapers. He wrote for the George Matthew Adams Service in 1914, and subsequently his articles were published through "The Associated Newspapers." Joining the McClure Syndicate in 1923, he continued his daily contributions of cheerful philosophy which were read by approximately 20,000,000 persons. Dr. Crane was at one time editor of the *Current Opinion*. He received the D.D. degree in 1894 from the Nebraska Wesleyan University. Many of Dr. Crane's newspaper articles were collected into book form, filling more than forty volumes, among the most important being: *The Religion of To-mor-*

row (1899); *Vision* (1907); *The Song of the Infinite* (1909); *Human Confessions* (1911); *God and Democracy* (1911); *Lame and Lovely* (1912); *Foot Notes to Life* (1913); *War and World Government* (1915); *Just Human* (1915); *Adventures in Common Sense* (1916); *The Looking Glass* (1917); *Christmas and the Year Round* (1917); *400 Four-Minute Essays* (10 vols., 1919); *The Crane Classics* (10 vols., 1920); *Why I Am a Christian* (1924); and *Everyday Wisdom* (10 vols., 1927).

CRANE, WILLIAM HENRY. American actor, died at Hollywood, Calif., March 7. He was born at Leicester, Mass., Apr. 30, 1845, and began his stage career, one of the longest in the history of the American theatre, as a boy singer at 18. He remained in opera eleven years, during which time his talents as a comedian manifested themselves strongly. His first engagement in the spoken drama was as a member of the Holley Stock Company, in Chicago, of which he became the leading comedian. Then, in 1877, he went to New York, and won immediate popularity in *Our Boarding House*. One of his fellow actors in the company was Stuart Robson, and the two formed an association that lasted until 1889. They played together in *Our Boarding House*, as the two Dromios in Shakespeare's *Comedy of Errors*, in Boucicault's *Forbidden Fruit*, and in *Our Bachelors*. They accompanied John McCullough on a tour of California that was a personal, artistic, and financial success.

Robson and Crane's greatest popularity was achieved in *The Henrietta*, but when the two parted company, in entire friendship, Crane went on to still greater public liking in *The Senator*, a powerful drama dealing with American public life. Then, in the decade from 1889 to 1899 he produced twelve plays by American authors, in addition to some other works. For three years he played the part of David Harum in a dramatization of the novel of that name, and afterwards appeared in *The Spenders*, *Father and the Boys*, a revised version of *The Henrietta*, and an all-star revival of *The Rivals*. In the last-named play his fellow actors included John Drew, Julia Marlowe, Francis Wilson, Nat Goodwin, E. M. Holland, Joseph Holland, and Robert Taber.

After passing his sixtieth birthday, Mr. Crane gave notable performances in *She Stoops to Conquer*, *Father and the Boys*, *United States Minister Bedloe*, *The Senator Keeps House*, *The Fool of Fortune*, and *The New Henrietta*. For a brief period he appeared in vaudeville, but for ten years preceding his death he lived in retirement in California. Much of his time was given to the writing of a book of reminiscences, *Footprints and Echoes*, published not long before his death.

CREAM. See DAIRYING.

CREDIT. See BANKS AND BANKING; BUSINESS REVIEW; FINANCIAL REVIEW.

CREDIT UNIONS. See COÖPERATION.

CRETE. An island in the Mediterranean Sea, ceded to Greece after Aug. 10, 1913. Area, 3327 square miles; population at the census of 1920, 110,746. Capital, Canea, with a population of 37,425, in 1920.

CRICKET. Cricket enthusiasts of Great Britain were treated to an unusual profusion of three-figure innings in 1928, there being a total of 414, or 105 in excess of the former record. Herbert Sutcliffe, of Yorkshire, E. H. Hendren,

of Middlesex, and C. P. Mead, of Hampshire, all passed the hundred mark on thirteen occasions.

International competition was afforded by the visit to the United States of two teams of West-Indian cricketers. A Bermuda combination played a series of eight games at New York and Philadelphia, winning six and drawing two. Barbados and other islands sent a team which made the most creditable record of twenty-one victories and five draws. The championships of both the New York and the New Jersey cricket associations and the Metropolitan District Cricket League were won by the Brooklyn Cricket Club.

CRIME. PSYCHIATRY AND CRIME. It was generally being recognized that out of the welter of sensational and useless discussion that had attended the periodical discovery of the "crime wave" in the United States two important facts had emerged, viz., that nothing of crime is known statistically, and that the mental factors of crime had been overlooked too long. Mention has been made under this head in the previous YEAR BOOK of the machinery that the State of Massachusetts had created for the handling of criminals by psychiatrists. This State in May, 1928, was the seat of an important congress when the Conference on Mental Factors in Crime met in Boston under the auspices of the Massachusetts Commission on Probation and the Massachusetts Society for Mental Hygiene. How forward had become the attitude of the officials of the State may be seen from the statement of the commissioner of correction that "psychiatrists have narrowed the field of responsibility and shown us the failure of our old assumptions with respect to the punishment of certain offenders."

Already this science had helped penology in the classification of the treatment of criminals i.e., which are to be put on probation, which to be put in institutions for mental defectives, which are to be specially educated in the institutions, which are to be treated as disciplinary problems. Another speaker pointed out that of 1168 courts in the country from which he received replies only 110 reported some regular psychiatric service or 9.4 per cent of the total. Out of the 259 penal institutions that reported, 29 had full-time psychiatrists on their staffs and 64 had part-time service, making almost 36 per cent for those reporting.

Prof. Harry Elmer Barnes, in his address, denied that psychiatry had no quarrel with the criminal law, but on the contrary insisted that the judicial machinery was opposed to a scientific approach to human behavior and that the public still refused to believe that "crime is just as much a medical problem as insanity." Other speakers pointed out that intelligent lawyers were willing to avail themselves of all the aid that medicine and sociology could offer; that there was need for a social self-audit of crime with particular attention being paid to studies of the effectiveness of different kinds of peno-correctional treatment and follow-ups of persons treated by the methods of modern penology. While the conference refused to go on record as advocating any single set of reforms, and, in fact, showed that marked divergences of opinion could be presented with the utmost reasonableness, it was apparent that it had served an important function in once more calling the attention of the lay public to a point of view up to recently treated with disdain.

Chief Judge Benjamin N. Cardozo of the New York Court of Appeals lent the great prestige of his name to the view that the penal code needed rewriting with particular reference to insanity in crime and to the law of homicide, in an address delivered before the New York Academy of Medicine in November. He declared that the work of bio-chemists, behaviorists, psychiatrists, and penologists must transform the system of punishment and that the death penalty would seem to the next generation "an anachronism too discordant to be suffered, mocking with grim reproach all our clamorous professions of the sanctity of life." He said further: "Adjustment of some sort there must be if we are to fulfill our duty to defective fellow-beings. . . . The sin, in truth, is ours, the sin of a penal system that leaves the victim to his fate when the course he is going is written plainly in the files of the courts and the stigma of mind and body." He called upon physicians to add their researches to that of the bar to draw a distinction between types of homicide, with particular reference to the weight to be given to insanity. There was urgent need for the exploration of "the dark mystery of crime, the mystery even darker, of the criminal himself in all the deep recesses of thought and will and body."

The same vital question was touched upon in a report issued earlier in the year by the National Crime Commission entitled, "Juries and Insanity Pleas." The report pointed out the futility of expecting lay juries to pass competently on pleas of insanity and referred with commendation to the Massachusetts and Colorado methods of entrusting the task to a commission of experts in mental diseases. The report recommended that the question of insanity of the defendant be passed upon before the case be submitted for trial. The YEAR BOOK has had occasion before to refer to the method employed in the State of Massachusetts. In Colorado, according to the report, a similar procedure was meeting with success. There, a plea of insanity in homicide resulted in the confinement of the defendant to the State hospital for mental diseases for observation. Upon the presentation of the findings of the experts the court decided whether the defendant was to be tried on the insanity issue or on the indictment. It was generally agreed that the present situation was hopeless not only because of the ignorance of such matters on the part of a lay jury but equally because the jury was thrown into confusion by the conflicting testimony of so-called alienists.

AMERICAN BAR ASSOCIATION. The president of the American Bar Association, in the presentation of his annual report to that body at Seattle in July, declared bluntly that at the centre of the crime situation was the bootlegger. Silas H. Strawn attributed the increase in crime to the following factors: 1. The development of hard roads and automobiles, making getaways easy. 2. Increased wealth, making purchase of automobiles and firearms possible. 3. Organized crime so that criminals can support politicians and buy protection. 4. Delay in the apprehension of criminals and the meting out of justice. 5. Indifference of citizens to their duties as jurymen, etc. 6. Unrestricted sale of firearms. To Prohibition, Mr. Strawn paid the following compliment: "Crime surveys show that crimes of

violence . . . committed largely by bootleggers and beer-runners, have increased to an alarming extent." The same general conclusion was arrived at by another speaker before the convention, A. V. Lashy of St. Louis, chief of the Association's section on Criminal Law and Criminology. Mr. Lashy gave the following results of his investigation into the crime situation, basing his conclusions on a symposium he had conducted: 1. Crime was being committed by professionals. 2. In cities of 100,000 and over, the criminal elements had not increased as a result of Prohibition. 3. In some of the large cities, criminal gangs were financed from profits in bootlegging. 4. Often the profits from bootlegging were used to corrupt public officials. See BAR ASSOCIATION, AMERICAN.

PHILADELPHIA. Philadelphia, during the year, proceeded to give an excellent example of how the police authorities were corrupted by bootleggers. Opening with the charges of the district attorney that a whisky ring had made \$10,000,000 in 1927 and that many police officials had been bribed, events began to move with the utmost rapidity. A grand jury, sitting on the prosecutor's charges, heard evidence to the effect that 11 murders could be traced directly to the operations of the whisky gang; that 13,000 "speakeasies" existed in the city; that a single distilling firm had diverted to bootleg sources 350,000 gallons of alcohol, etc. The grand jury, after 10 weeks of investigating, presented its recommendations on October 29. It called for the dismissal of 18 captains and 3 inspectors, representing nearly one-half of the commanders in the Philadelphia Police Bureau, on the ground that they "were unfit to hold public office." Of these men the jury found that "the money received and handled by them was either all or substantially all dishonestly acquired." These 21 men, according to the grand jury, had banked \$800,000 in addition to securities and real estate owned by them. On November 2, a Philadelphia court imposed prison terms and fines on a Republican ward leader and two police captains and three district detectives who had pleaded guilty to extortion, bribery, and conspiracy to extort money from saloon keepers.

NATIONAL CRIME COMMISSION. A subcommittee of the National Crime Commission, in a statement made public in March, reported: 1. That crime was a safe business. 2. That few arrests were being made in proportion to the crimes committed. 3. That the police were woefully inefficient, an important factor being the lack of intelligence in the supervisory branches. 4. That the sheriff's office was an anachronism. 5. That politics influence the police. 6. That prosecuting attorneys had too great power and not enough responsibility to their public. Other findings also enumerated a minor judiciary that was poor in character, lax bail methods, and the lack of criminal statistics. To prove its point ament the fewness of arrests the committee cited the case of Baltimore where, for burglaries committed, only 21 per cent of arrests were made and for these only one-half were convicted. Against this record was to be placed that of Canada where there were arrests for 84 per cent of indictable offenses and where convictions totaled 75 per cent of the arrests. The commission laid all these troubles at the door of the inadequate police forces. It cited the case of the

police of Cleveland who, a few years previously had been examined by the army intelligence tests. These tests established that only 3 per cent of the men were in the first grade and that only 41 per cent were of average intelligence or above. A large proportion of the remainder belonged in the moron class. Other parts of the commission's report cited the oft-repeated criminal statistics of England and Wales to prove how much more debauched were American cities.

It was refreshing to observe signs of recalcitrancy on the part of the American press. The following criticisms of the commission's report are taken from the *Literary Digest's* review: 1. Comparisons with England are misleading because it has a homogeneous population; it has few immigrants; it makes little use of the automobile, while in the United States automobiles are easy to steal for the getaway; it is a country of little distances; it is an island and its ports of exit can be easily sealed; its criminal courts function more speedily, more harshly and with fewer appeals. 2. It cannot be proved that our police are of inferior intelligence for data cited are several years old; the army tests do not measure intelligence; in every large city police applicants must pass stiff civil service examinations. 3. It is foolish to quote figures showing the low number of arrests for crimes committed for, obviously, each crime does not represent one criminal. A criminal continues committing his crimes until he is apprehended and put out of the way.

In February, another statement from the same source put the value of loot disposed of annually by "fences," as receivers of stolen goods are known, at \$500,000,000. Newton D. Baker, chairman of the commission, who made the announcement, reported that the solitary burglar was disappearing and that he was being replaced by crime associations who found it easy to operate because they could easily dispose of loot. The fence depended upon his ability to maintain a warehouse and upon the laxity of the laws. Because stolen goods were being shipped over the country, Mr. Baker felt that the fence could be reached by the Federal Government through its power to regulate interstate commerce. With this in view, the Commission drafted a bill for introduction before Congress making receivers or transmitters of stolen goods liable to a fine of \$5000 or a sentence of two years in prison or both. The National Crime Commission pointed out that while it had consistently advocated State rather than Federal legislation for the suppression and reduction of crime, it believed that the fence could be reached only through National legislation, because the offense was rarely confined to one State and because the interstate activities of thieves, receivers of stolen goods, and their allies made it impossible to build up a complete case against the criminal.

STATISTICS OF MURDERS. The YEAR BOOK has contained before reports of the investigations of Dr. Frederick L. Hoffman into the homicide rate in the United States. For the year 1927, Dr. Hoffman found that a total of 12,000 murders had been committed, making a rate of 101 per million of the population. During the year in question, the rate increased in 51 cities out of the 122 for which it was possible to collect statistics. The highest murder rates were in the following cities: Memphis, 89.3 per 100,000

population; Birmingham, Ala., 63; Charlotte, N. C., 55.5; Jacksonville, Fla., 54; Atlanta, Ga., 43.4; Miami, Fla., 40; East St. Louis, Ill., 39.7. With these extraordinarily high rates are to be compared New York's rate of 6.1 and Philadelphia's 8.4. Chicago's rate of 13.3 was greater than that for the whole country though it was a decided improvement over the rate of 1926 which had been 16.7. Boston's rate was 3.9.

Dr. Hoffman contrasts the American cities with the situation in Moscow where the homicide rate in 1925 was 4.5 and in 1918, which he calls the worst period in the recent history of Russia, Moscow's rate was only 8.2. As usual, the writer's observations are worthy of serious attention. Dr. Hoffman points out that there is no correlation between the enforcement of the death penalty and the number of murders committed annually. He says: "A study of the facts cannot but convince one of the precariousness of the enforcement of the death penalty and its far-fetched relation to the repression of homicidal crimes." Dr. Hoffman found in New York State one execution to every 40 homicidal deaths. It is his belief that the ease with which firearms may be procured, and the great number of times that murderers have been able to cheat the law by suicide, even when under the custody of the law authorities, are important reasons for the great homicidal rate in this country. Dr. Hoffman, like other modern students of crime, places no reliance in the death penalty as a deterrent.

The following are additional reasons for the high murder rate: murder is becoming more difficult of detection; the abuse of the pardoning power; the cumbersome and antiquated judicial machinery. It is refreshing to see that Dr. Hoffman appears slightly skeptical as to the immediate results to attend the many crime investigations current during 1928 in the country. He says: "The national crime commission and the local crime commissions have published voluminous reports, but the problem remains much the same. Charges have been made that our police are unintelligent and that our police administration lacks efficiency, but it is probably as good as that of any other country in the world. The true cause of our crime situation is to be found in the changing character of the American people, for every element of the nation is represented in the long list of murders, from youth to old age, men and women, black and white, native and foreign, rich and poor."

NEW YORK STATE. The New York State Crime Commission, whose activities have been referred to frequently in the YEAR BOOK, in making public the report of its subcommission on statistics, indicated that New York State was going to take the lead in the collection and publication of crime statistics. Said the statement of the subcommission's chairman: As a result of the commission's work we have this year written upon the statute books amendments to the existing law to improve in a very great degree the system of obtaining criminal statistics. While some things yet remain to be done, we have progressed in that respect further than any other State in the Union. The report presented figures to indicate that the presence of the Baumes Laws on the statute books had caused a drop in the major crimes committed in the State. The figures for the City of New York were studied for 1925, 1926, and 1927. For the last year the figures

for murder and manslaughter, assault, and robbery were lower than for the two preceding years. Note these figures:

	<i>Murder and Manslaughter</i>	<i>Assault and Robbery</i>	<i>Burglary</i>
1925	308	1483	4103
1926	289	1173	3373
1927	278	951	3380

The report devotes a good deal of attention to the "fourth offender" law which went into effect July 1, 1926. From Jan. 1, 1927 to Jan. 12, 1928, 65 charges of "fourth offender" were made. Of this number, 17 were tried and sentenced to life imprisonment, 3 were found guilty of the felony charge in the arrest and were being investigated, 14 were permitted to plead guilty to misdemeanors and were sentenced to the city penitentiary or workhouse, 2 were tried for felony, found guilty of a misdemeanor, and punished for such, 23 were found not guilty and discharged or dismissed, and 6 were delivered over to the police authorities.

In June the Baumes Laws were upheld by the New York State Court of Appeals, when it found that trial courts had no discretion to permit a second offender to escape the special penalties for such classes of criminals. The decision arose out of the action of a county judge in permitting a second offender to plead guilty to a minor charge of petty larceny.

The State Crime Commission, late in November, announced the results of its hearings on Governor Smith's proposal for a sentencing board. (See 1927 YEAR BOOK.) Two counter-suggestions had emerged. The first provided for the creation of a "court of re-sentence" in each judicial district to which would come all first offenders and those felons not liable under the Baumes Laws. The second suggestion called for the creation of an advisory board made up of judges, psychiatrists, and criminal experts to be called into consultation by the presiding judge. Other opinions expressed before the Commission called Governor Smith's proposal "very technical and legal" and held that the sentencing board "would be a most pronounced step to be taken at the present time, since it would mean the abrogation of the power of a judge to sentence a prisoner." The release of entirely unfavorable comment indicated that the Crime Commission itself had no sympathy for the suggestion.

TRUANCY AND CRIME. The Crime Commission of New York State, in a report on an investigation of 251 juvenile delinquents made public late in November, showed that truancy was the first step in the launching of a crime career. These 251 cases made up 679 arraignments divided into the following: 377 truancy charges, 130 juvenile delinquency charges, 177 misdemeanors, and 55 felonies. Fifty-one per cent of the children had court records subsequent to truancy. The report of the Crime Commission revealed some interesting statistics. Fifteen per cent of the group studied were of native parentage. The more serious crimes, i.e., burglary, grand larceny, and robbery, were committed more frequently, in proportion to their numbers, by the children of native-born parents and remote immigrants than was the case of the children of recently arrived immigrants. Almost the entire group surveyed lived under conditions of extreme

poverty. Family conditions, too, were unfavorable, in that homes had been broken up by death or desertion. The report pointed out the extraordinary wastefulness of the legal method of handling problems such as these in the following: "The individual method is probably less expensive than the method of legal procedure. In the 251 cases studied no fewer than 679 arraignments before educational and judicial authorities took place and 460 commitments were made to various reformatories and penal institutions. The process of arraigning and maintaining these boys must have cost incalculable thousands. The community has been reimbursed through fines to the extent of \$368. Surely New York City, with its willingness to tear down old structures to make place for new must concede the like importance of tearing down old methods when they stand in the way of progress. . . . There is no doubt that the time to institute modern methods of child guidance is during childhood. There is no doubt that the school system is the place to begin the method. A decent consideration for our wayward children, if not for our own security and peace of mind, requires that we inaugurate such methods without further delay." The report carried the following recommendations: The establishment in schools of clinics for the medical, psychological, and psychiatric study of behavior-problem children. A revision of the school curriculum to meet the needs of that large group of children who have not the capacity for the regular academic curriculum because of mental defectiveness or emotional instability. The Bureau of Attendance of the Board of Education should be furnished trained case-workers for the supervision of children who are chronic truants.

CHICAGO. The newspapers continued to be filled with vivid accounts of the uncertainties of life in America's second largest city. There were tales of bombings of the homes of gangsters as well as of innocent citizens; of elaborate funerals for slain gangsters; of jurors intimidated, a corrupt police force, and politics, being the handmaiden of crime. One alarmed newspaper man put the estimated number of violent deaths in the city for one year at "between 600 and 1000 persons and the number of felonies committed at thousands." Naturally, these tales gave prominence to different views publicly expressed by various individuals. For example, Judge Marcus Kavanaugh of the Cook County criminal bench was given earnest attention when he said that there were two things wrong with American criminal theory: first, that this country stood alone in allowing the accused to be considered innocent until proved guilty beyond a reasonable doubt; and second, that we were all wrong in imprisoning men to reform them. We should imprison men to punish them, refuse bail to all indicted persons formerly convicted of a felony, limit paroles, pardons, and probation to first offenders only, make a five-sixths verdict of the jury sufficient except in death penalty cases, and kill all murderers. In short, there is everything here but sterilization.

It was reported that the Chicago Bar Association indorsed most of the judge's recommendations. Other zealous persons found that the existence of foreign-language groups were responsible for the "crime wave" and that therefore what was needed was a law compelling these

people to abandon their foreign-language newspapers and read and write the English language. Also, martial law would help. Also, being ferocious would help. There is cited, in approval of this matter, the action of the Chicago Crime Commission which "bears down hard on criminals by endeavoring to see that their punishment is severe and inevitable. It fights continuances and delays." The work of this crime commission was called the only bright spot in the city and it was credited with the decrease in burglaries and robberies. "However, the number of murders shows an increase from 330 in 1919 to 399 in 1927. As the first half of the current year carries a total of 186, it appears that 1928 will reveal an encouraging decrease." In short, crime was decreasing, crime was not decreasing; the crime commission has been responsible for the lowering of the number of felonies, it has not lowered the number of murders. The crime situation in Chicago appeared to be very confusing.

BIBLIOGRAPHY. The above views of Judge Marcus Kavanaugh are to be found in his *The Criminal and His Allies* where the keynote sounded is that the unfailing panacea for criminality is summary justice and severe punishment. Boris Brasol's *The Elements of Crime* is of another order. He analyzes the social and bio-psycho factors in crime, though he insists upon discounting unduly the force of economic conditions. Mr. Brasol recognizes the important rôle of psychiatry, but does not give the subject adequate treatment. *The New Criminology*, by Max Schlapp and Edward H. Smith, is frankly revolutionary. Dr. Schlapp believes that crime is a socio-medical problem in which lawyers and judges have no important rôles. He regards crime as an aspect of human behavior and points out that only in the study of behavior shall we get at anything vital. See ILLINOIS; INDIANA.

CROATIA (krô-â'shî-â) **AND SLAVONIA.** Since 1928 a province of the new State of Jugoslavia, formerly a crownland of the Austro-Hungarian Empire, extending from the Adriatic Sea to the Danube River. Area, Jan. 31, 1921, 16,920 square miles; population at the same date, 2,739,593. Capital, Zagreb or Agram, with a population in 1921 of 108,338 (estimated in 1927, 130,000). See JUGO-SLAVIA.

CROPS. See AGRICULTURE and articles on various crops such as CORN, OATS, TOBACCO, WHEAT, ETC.

CROSS-COUNTRY RUNNING. The United States national cross-country championship in 1928 passed from Willie Ritola, who had held it for three years, to Gus Moore of the Brooklyn Harriers Association. Moore covered the six-mile course at Van Cortlandt Park, New York City, in 31 minutes, 18 seconds. Ritola did not compete. Moore also captured the Metropolitan senior title over the same course, Ritola passing up a defense of this title, too.

Pennsylvania State College for the third year in succession won the championship of the Intercollegiate Association of Amateur Athletes of America. The individual honors went to James L. Reid of Harvard who won by 12 yards from

Francis Lindsay of the University of Maine. William Cox, who had won this title two years in succession, finished in third place.

Frank Titterton of the Millrose A.A. captured the national ten-mile championship and Clarence De Mar of Melrose, Mass., won the annual Marathon contest. See OLYMPIC GAMES.

CRUISER. See NAVAL PROGRESS.

CRUSTACEA. See ZOÖLOGY.

CUBA. A republic of the West Indies consisting of the large island of the same name, the Isle of Pines, and small adjacent islands. Capital, Havana.

AREA AND POPULATION. The area is 44,164 square miles of which 41,634 are for the island of Cuba, 1180 for the Isle of Pines, and 2350 for the other islands. According to figures furnished by the Director of the Census Bureau the population of Cuba on Apr. 30, 1926, was 3,350,026 inhabitants, distributed as follows:

	<i>Inhabitants</i>
Pinar del Ría	280,831
Habana	922,433
Matanzas	335,080
Santa Clara	719,263
Camagüey	245,042
Oriente	847,377

According to the same source the population at the beginning of 1928 was 3,573,850. In 1928 there were 17,469 marriages, 58,387 births, 6008 still-births, and 41,751 deaths.

The City of Havana had 580,946 inhabitants in 1928, being the only city in the Republic whose population was over 100,000. Other important cities are Cienfuegos, 72,919; Camagüey, 92,073; Manzanillo, 60,544; Santiago de Cuba, 73,800; Guantánamo, 52,598; Santa Clara, 69,200; and Sancti Spiritus, 86,418. There is a large transitory immigration yearly consisting largely of Spanish laborers who return to Spain after the harvest season. The number of immigrants in the year ending June 30, 1927, was 37,186 representing many nationalities. The largest number, 19,193, were Haitians, followed by 9555 Spaniards and 2312 Jamaicans.

EDUCATION. Primary instruction is free and compulsory between the ages of 6 and 18. The public system was developed under American supervision after the passage of the Education Act of 1899. According to statistics compiled by the Division of Statistics, there were, in the year ending June 30, 1927, 321,821 children enrolled in the 3702 elementary schools, which had 7110 teachers. There were also 70 traveling teachers who taught 3435 pupils; 82 night schools for working people with 3679 pupils. There were also 467 private schools with 1545 teachers and 30,293 pupils. There is a special institute for advanced instruction in each province, and annexed to each is a normal school for the training of teachers. University instruction is provided by the University of Havana, which was founded in 1721 and had 5473 students in 1926-27.

PRODUCTION. Cuba is essentially an agricultural country, sugar and tobacco being the staple commodities. Other products are cacao, cereals, coffee, potatoes, and fruits. The island is the largest producer of sugar in the world. (See SUGAR). Despite the plan of governmental control (see two preceding YEAR BOOKS) of the sugar industry, with a view to reducing the oversupply in world markets, the price of 1927

responded only partially. However, restriction was to be continued in 1928, and the crop limited to 4,000,000 tons as compared with 4,508,000 tons actually produced in 1927. The trouble with

United Kingdom increased by 43.8 per cent, the actual gain being \$9,636,854. Germany and Spain also purchased slightly more in 1927 than in the previous year.

CUBAN EXPORTS BY COUNTRIES OF DESTINATION

Country	1926	1927	Increase or decrease	Per cent of gain or loss
United States	\$242,881,819	\$254,195,052	+\$11,313,233	+4.6
Other American countries	10,696,130	10,020,398	-675,732	-6.3
United Kingdom	21,981,160	31,618,014	+9,636,854	+43.8
France	5,975,303	4,284,336	-1,690,967	-28.3
Germany	1,676,136	2,249,685	+573,549	+34.2
Spain	1,325,242	1,505,275	+180,033	+13.6
Other European countries	5,455,681	9,739,537	+4,283,906	+78.5
All other countries	11,717,310	7,532,358	-4,184,952	-35.7
Total	\$301,708,731	\$321,144,655	+\$19,435,924	+6.4

the economic structure of Cuba is the fact that it depends almost entirely on the price of sugar. With the dislocation of the European beet-sugar industry during the War and the resultant heavy demand for sugar, Cuba, with its many advantages, rapidly increased its output. The heavy investments in sugar production, embracing investments in railways and other facilities incident to this expansion, caused a corresponding growth of commerce and industry. This culminated in the boom of 1920, when sugar prices went to abnormally high levels, and the

Imports into Cuba recorded a further loss of 1.4 per cent in 1927, dropping from \$260,826,438 to \$257,088,036 as a result of the continued depression of business which existed throughout the year. Imports from the United States were approximately the same as in 1926, but the percentage of the total increased slightly from 61.4 in 1926 to 62.1 in 1927. France, which was the only major country to which Cuba exported less in 1927 than in 1926, was, on the other hand, the only major country to show a gain in imports in 1927.

CUBAN IMPORTS BY COUNTRIES OF ORIGIN

Country	1926	1927	Increase or decrease	Per cent of gain or loss
United States	\$160,051,621	\$159,681,523	-\$370,098	-.2
Other American countries	24,592,835	23,037,534	-1,555,301	-6.3
France	11,873,427	12,415,512	+542,085	+4.5
United Kingdom	12,473,886	11,503,783	-970,103	-7.8
Spain	11,515,931	10,450,061	-1,065,870	-9.2
Germany	7,742,852	7,649,660	-93,192	-1.2
Other European countries	13,470,195	14,343,835	+873,640	+6.5
All other countries	19,105,691	18,006,128	-1,099,563	-5.8
Total	\$260,826,438	\$257,088,036	-\$3,738,402	-1.4

severe depression of 1921 followed. The check to the sugar industry was only temporary and in 1925 and 1926 exports of sugar were greater in quantity than in 1920. With the progressive restoration of the beet industry in Europe and the continued growth of production in Cuba and in other countries, the industry has been faced with surplus supplies which account for the low prices of recent years. When the price of sugar is low it naturally follows that Cuba's buying power is seriously restricted.

COMMERCE. The foreign commerce of Cuba in 1927 amounted to \$578,232,691, an increase of \$15,697,522 over that of 1926, according to figures issued by the statistical section of the Cuban Treasury Department. The improvement in 1927 was a result of the enhanced value of exports, as imports recorded a further recession, which increased the favorable balance of trade from \$40,882,293 to \$64,056,619.

Exports were valued at \$321,144,655 in 1927, an increase of 6.4 per cent as compared with the total of \$301,708,731 in 1926. The improvement in the export trade was primarily the result of greater returns from the sugar crop, which, despite the smaller quantity exported in 1927, brought a higher return. Exports to the United States increased \$11,313,233 and were 79.1 per cent of the total as compared with 80.4 per cent in 1926. Shipments to the

FINANCE. The unfavorable economic conditions prevailing throughout Cuba in 1926, 1927, 1928 have made the task of balancing the budget difficult. Early in 1927 it was resolved to cut down the 1926-27 budgetary expenditures from about \$87,000,000, as voted in 1925 by Congress, to about \$81,000,000. This was done by reducing the budgetary item of \$5,000,000 to be paid into the public works fund to \$500,000, and by passing the payment of \$2,650,000 to be made by law to holders of "floating debt certificates." The budget of 1927-28 was similarly reduced to \$80,940,802. An arrangement was made for an advance by New York bankers of \$9,000,000 to pay off the floating debt certificates.

The budget for 1928-29 provided revenues of 84,400,000 pesos and expenditures of 84,387,210 pesos, leaving a surplus of 12,790 pesos.

The total debt of Cuba on Feb. 29, 1928, was \$93,443,500, of which \$83,379,300 represented foreign debt and \$10,064,200 internal debt. Between Sept. 30, 1927 and Feb. 29, 1928, \$2,475,200 had been paid off on the combined debt.

COMMUNICATIONS. In 1926, 7408 vessels of 24,421,972 tons net entered and 7244 vessels of 23,893,754 tons net cleared the ports of the Republic in the foreign trade. In the coastwise trade 11,094 vessels of 2,062,664 tons net entered and 11,035 vessels of 2,062,646 tons net cleared. The total length of railways in Cuba in

the spring of 1928 was 4871 kilometers. In reporting on the Cuban railways in 1927, it was stated that the economic depression which prevailed throughout the country during 1927 naturally reacted adversely on the railroads of the Havana consular district. Both freight and passenger traffic suffered from this depression. The after-effects of the cyclone of 1926 were especially noticeable, as the damage to the sugar cane resulted in a lowering of the sugar content and a consequent operating loss to the mills of the Provinces of Havana and Pinar del Rio. Another reason for the decrease in revenues was the increase in competition offered by the omnibuses, which had not only established many lines in the City of Havana and its suburbs, but had extended their services to reach many small outlying towns.

The principal new construction enterprise initiated by the railroads in 1927 was the completion by the Consolidated Railways of Cuba of a standard-gauge line connecting Moron with Santa Clara, a distance of 152 kilometers. The United Railways extended their service of gas cars. Nine were in operation and orders were placed for eight more. When these new ones arrive it was expected that 559 kilometers of railroad would be devoted to the gas car service, supplanting the more expensive steam locomotive service. This company also during 1927 renewed 25 kilometers of track with 80-pound rails and 19.7 kilometers with 62-pound rails. The Central Providencia constructed a new branch covering two kilometers of wide-gauge track. The Hershey Cuban Railway Co. constructed 12 kilometers of track for private cane-car service. The length of the United Railways of Havana at the close of 1927 totaled 1301 miles, as compared with 1250 in 1926. Operating revenue during the fiscal year ended June 30, 1927, amounted to \$17,658,825 (\$19,197,517 in 1925-26), and operating expenses were \$13,271,541 (\$14,489,335 in 1925-26). While receipts for the year showed a large decrease, it was not nearly as much as the decrease of \$4,954,823 in the previous year as compared with the fiscal year 1924-25. The new railway tariffs established by the Railroad Commission, which were put into effect on Apr. 26, 1927, had very little effect on the operating results of the railway, since they were actually in effect only about two months before the close of the fiscal year.

In 1927 there were 1030 miles of highway; in 1925, 10,939 miles of telegraph wire; in 1926 63,834 telephone instruments in use; and in 1927, 38,038 motor vehicles were registered.

GOVERNMENT. Executive power is vested in a president and cabinet; and legislative power in a congress of two houses, viz., a senate with 24 members and a house of representatives with 118 members. President in 1928, Gen. Gerardo Machado, inaugurated May 20, 1925; term expires May 20, 1929; Vice President, Carlos de la Rosa. See **MILITARY PROGRESS.**

HISTORY. The amendments to the Cuban constitution approved by Congress were submitted to the Constitutional Convention in accordance with the provision of Article 115 of the constitution. On May 9, 1928, the Constitutional Convention approved these amendments and transitory provisions, which were then published by order of the President, becoming a part of the constitution on May 11. Among the most important changes effected were: Article 38, which for-

merly granted suffrage only to male Cubans over the age of 21, with certain exceptions, now grants suffrage to all Cubans over 21, the laws governing woman suffrage to be passed by a two-thirds vote of the total number of the members of the Chamber of Representatives and the Senate: The Isle of Pines is now incorporated in the territory of the Republic: The Municipality of Havana was suppressed and the Central District created in its place: The number of Senators from each province was increased from four to six: The term of a representative was increased from four to six years, and the chamber is to be renewed by half its members every three years instead of every two: The presidential term is extended from four to six years, the right to reelection being eliminated.

As a result of a general election for president held on November 2, General Gerardo Machado, the choice of the three main political parties in Cuba, was elected to succeed himself. He was elected for six years in accordance with the constitutional amendment mentioned above. During October a meeting of the United Spanish War Veterans was held in Havana. In addressing this body, President Machado urged the repeal of the Platt Amendment to the Cuban Constitution on the grounds that it was no longer necessary since Cuba had achieved a stable government and was a sovereign power in every way.

CULTURE. See **ANTHROPOLOGY.**

CUMBERLAND PRESBYTERIAN CHURCH. A branch of the Presbyterian Church, originally the Cumberland Presbytery of Kentucky. It was formed in 1810, when the so-called anti-revival party of the church objected to the admission into the ministry of men who were not up to the usual literary and theological standards and to the doctrine of fatality as taught in the third and tenth chapters of the Westminster Confession of Faith. Its chief strength was in the Southern States, in consequence of which it was barely saved from disunion during the slavery dispute at the time of the Civil War. This situation led to the establishment of the Colored Cumberland Presbyterian Church (see below). A general assembly which meets annually is the supreme judiciary. In 1928 the denomination comprised 11 synods and 62 presbyteries, and there were 1215 churches, reporting 753 ministers, and a church membership of 57,695. The Sunday-school enrollment was approximately 50,000. The property of the church was valued at \$3,480,621, not including \$500,000 endowment for education. Missionary work was carried on among the Indians in the United States, and churches were maintained in China, where there was an organized presbytery at Canton with eight churches in South China. During the year mission work was opened up in South America. The denomination carried on educational work under the direction of the Board of Education and maintained Bethel College and the Cumberland Presbyterian Theological Seminary, both at McKenzie, Tenn. *The Cumberland Presbyterian*, published at Nashville, Tenn., is the official organ of the Church. The 1928 national meeting was held at Jackson, Tenn., and the 1929 meeting was announced for May 10-22, at Princeton, Ky. The Rev. J. L. Hudgins, Nashville, Tenn., was moderator of the general assembly, and the Rev. D. W. Fooks, Paducah, Ky., was stated clerk and treasurer.

CUMBERLAND PRESBYTERIAN CHURCH, COLORED. A branch of the Cumberland Presbyterian Church which was legally set apart as a separate unit in 1869. The membership of 178 churches of the denomination for which figures were given in the United States census of religious bodies of 1926 was 10,868, as compared with 136 churches and 13,077 members in 1916. In 152 churches reporting Sunday schools, there were over 5000 pupils and 840 officers and teachers, as against 7471 pupils and 928 teachers and officers in 1916. The total expenditures of 167 churches in 1926 amounted to \$80,304, of which \$70,437 was for current expenses and improvements and \$9867 for benevolences, missions, etc.; while 127 churches reported total expenditures of \$39,497. The value of church edifices, including furniture and equipment, as reported by 162 churches, was \$353,825 in 1926, as compared with \$230,426 reported by 130 churches in 1916. Of the 178 churches reporting in 1926, 60 were in urban communities and 118 in rural districts.

CURACAO, koo'ra-sā'ō. A Dutch colony in the West Indies consisting of two groups of islands about 500 miles apart, one of them comprising the islands of Curaçao, Bonaire, and Aruba, and the other consisting of the southern part of St. Martin (the northern part belongs to France), St. Eustache, and Saba. Area, 403 square miles; population, Dec. 31, 1926, 58,162, of whom 38,781 were on the Island of Curaçao. The capital is Willemstad, on the Island of Curaçao, with a population of 17,889. In 1926 there were 51,520 Roman Catholics, 5978 Protestants, and 549 Jews. The movement of population in 1926 was: Births, 1746; deaths, 1539; marriages, 455. In the same year there were 43 schools with 8813 pupils. The chief products of the colony are maize, beans, pulse, cattle, salt, and phosphate of lime. The chief industry is oil-refining. The crude oil is imported from Venezuela and Mexico. In 1926 the imports were valued at 107,178,462 guilders and the exports, 95,487,238 guilders; 6817 vessels of 17,895,686 tons entered the ports of the colony in 1926. In 1928 the budget revenue was estimated at 3,597,600 guilders and the expenditure at 3,535,824 guilders. The colony is administered by a governor aided by a council and a colonial council, the members of both being nominated by the sovereign. Governor in 1928, Dr. N. J. L. Brantjes.

CUREL, VISCOUNT FRANÇOIS DE. French novelist and playwright and member of the French Academy, died at Paris, April 26. Born at Metz, June 10, 1854, he was educated at the College of St. Clément, Metz, and studied engineering at the Central School of Arts and Manufactures, in preparation for assumption of control of his family's extensive metallurgical business, but he gave up commercial affairs for the writing of novels and plays. He was especially successful as a dramatist, and his work was recognized in 1918 by his election to the French Academy and by his appointment as an officer of the Legion of Honor. He was been called by critics one of the most powerful and original French dramatists of modern times, and has been compared with Corneille and Ibsen. Many of his plays treat of labor and capital, the genesis of religion, and the modern idolatry of science, and show the influence of Ibsen. His plays include: *A False Saint*, *The Possils*, *The*

Lion's Feast, *The New Idol*, *The Girl Savage*, *The Dance Before the Mirror*, *No Man's Land*, *The Comedy of Genius*, *She Who Brought Life*, *He Who Was Dying*, and *The Mystical Storm*. He wrote also two novels, *The Summer of the Dry Fruits* and *The Rescue of the Grand Duke*.

CURLING. The United States regained possession of the Gordon International Medal in 1928. The thirty-fourth annual competition for this trophy was held at Utica, N. Y., in March when the United States team defeated Canada by a score of 278 to 254. The trophy had been in possession of the Canadians for three years.

CURRENCY. See COINS, VALUE OF FOREIGN; FINANCIAL REVIEW; MONEY; UNITED STATES.

CURTIS INSTITUTE OF MUSIC. See MUSIC.

CYCLING. Cecil Walker of Australia for the fifth consecutive year captured the all-around bicycling championship of the United States. Lucien Michard of France retained his world professional crown and Franco Georgetti successfully defended his motor-paced championship. Georgetti also was the outstanding six-day rider of 1928, he and his partners winning both of the competitions held at New York City and finishing third in the only Chicago six-day race in which he competed. Walter Sawall of Germany won the world professional motor-paced championship, the amateur honors going to Willy Falck Hanson of Denmark. Freddie Spencer captured the American professional sprint title, and Charley Ritter of Newark won the all-around American amateur championship.

CYPRUS. A British island, situated 40 miles from the coast of Asia Minor and 60 from the coast of Syria; the third largest island in the Mediterranean Sea. Area, 3584 square miles; population, according to the census of 1921, 310,709, of whom 61,422 were Mohammedans. Capital, Nicosia, with a population of 18,461. In 1926 there were 889 elementary schools with 1270 teachers and an enrollment of 48,501, of whom 38,477 were Greek Christians. With about one-third of the arable land under cultivation, agriculture forms the chief occupation of the people of the island. Forestry and the cultivation of the vine are rapidly taking an important place in the production of wealth on the island. Among the principal agricultural products are wheat, barley, oats, potatoes, linseed, cotton, animal products, and fruit. Asbestos and copper are mined and exported in considerable quantities.

The merchandise imported in 1927, was valued at £1,585,939; exported, £1,542,870. The revenue for the same year was £629,266 and the expenditure, £655,227. The total shipping which entered and cleared amounted to 1,584,685 tons in 1926. The island was administered under a convention with Turkey by Great Britain after June 4, 1878, and was annexed by Great Britain at the outbreak of the war with Turkey on Nov. 5, 1914. It is under a high commissioner having the usual powers of a colonial governor, aided by an executive council and a legislative council of 24 members of whom 9 are office-holders and the remainder elected for five years, 12 of them by non-Mohammedan voters and 3 by Mohammedan voters. On May 1, 1925, the island was given the status of a colony. Governor during 1928, Sir Ronald Storrs.

CYRENAICA. A colony belonging to Italy on the north coast of Africa; until 1919 it

formed a part of Libya; in that year for administrative and military purposes, Libya was divided into Cyrenaica and Tripolitania. (See TRIPOLITANIA.) The area is estimated at about 285,640 square miles; population, according to the census of 1926, about 185,000 natives, and 10,000 Europeans. Benghazi is the principal town with a population of 30,056 in 1927. The chief occupation of the people is agriculture, although there are vast possibilities for cattle raising. Barley and wheat are the chief products. The former is the chief food of the people. In 1926 the imports were 171,733,100 lire and the exports 25,930,800 lire. The principal imports are cotton goods and sugar and the principal exports, sponges and barley. The internal commerce consists mainly of caravan trade between Benghazi and Wadi. For 1927-28 the revenue and expenditure were estimated at: Colonial revenue, 207,170,250 lire; civil expenditure, 60,124,000 lire; military expenditure, 147,046,250 lire; estimated revenue and expenditure for 1928-29, 209,206,250 lire. Governor during 1928, S. E. Attilio Teruzzi (appointed Dec. 2, 1926).

CZECHOSLOVAKIA, *chěko-slovákia*. An eastern European republic, formed Oct. 28, 1918, out of the Slav regions of the old Austro-Hungarian Empire; formally dedicated a republic, Nov. 14, 1918; comprising the former Austro-Hungarian provinces of Bohemia, Moravia, Silesia, Slovakia, and Ruthenia, together with the portion of the Teschen district assigned to Czechoslovakia at the Ambassadors' Conference July 28, 1920. Capital, Prague.

AREA AND POPULATION. The total area of Czechoslovakia is 54,207 square miles. The population at the census of Feb. 15, 1921, was 13,613,172. By race it was distributed as follows: Czechoslovaks, 8,760,937 (65.5 per cent); Germans, 3,123,568 (23.3 per cent); Magyars, 745,431 (5.5 per cent); Ruthenians, 461,849 (3.4 per cent); Jews, 180,855 (1.3 per cent); Poles, 75,853 (0.5 per cent); others, 25,871 (0.2 per cent). There were also 238,808 aliens. The Czechoslovaks and Germans made up almost exclusively the population of Bohemia and Moravia, and the Czechoslovaks about half of Silesia and more than two-thirds of Slovakia. The largest cities, with their populations in 1921, are: Prague, 676,657; Brno, 221,758; Ostrava, 113,709; and Bratislava, 93,189. The majority of the people are Roman Catholics, who numbered 10,383,833 in 1921. An official estimate of the population on Dec. 31, 1926, placed it at 14,356,600.

EDUCATION. Primary education is compulsory between the ages of 6 and 14. In 1926 there were 14,158 public and private elementary schools, with 694,282 boys and 709,541 girls and 1736 public and private higher grade schools with 165,601 boys and 144,409 girls. There were also 354 secondary Latin and technical schools with 108,760 students. There are four universities as follows: Prague (Czech) with 8176 students; Prague (German), 3447; Brno (Czech), 1878; Bratislava (Slovak), 1309.

PRODUCTION. Czechoslovakia is one of the richest of all European countries in natural resources, and it finds itself in the enviable position of being almost self-supporting so far as food is concerned. Within the present borders of Czechoslovakia are to be found practically all of the former Austro-Hungarian Empire's sugar-producing area, 60 per cent of the breweries, 50 per

cent of the alcohol distilleries, nearly two-thirds of the iron production, and four-fifths of the textile industry. Other industries were included in like proportion in the new country, some even to the extent of 100 per cent, such as the famous Bohemian glass industry and the china industry.

The soil of Czechoslovakia is naturally fertile, especially in the lower part of the country, where the cultivation of beets, wheat, barley, rye, and oats is carried on quite extensively. The area under the principal crops and their yield in metric tons during 1926 were as follows: Wheat, 1,551,750 acres, 928,889 tons; rye, 2,068,563 acres, 1,166,138 tons; barley, 1,763,834 acres, 1,143,061 tons; oats, 2,093,136 acres, 1,379,886 tons; potatoes, 1,604,903 acres, 5,046,685 tons; sugar-beet, 686,464 acres, 6,599,051 tons; maize, 391,793 acres, 265,502 tons. In 1925-26 there were 166 sugar factories in the country, which produced 1,507,344 metric tons of sugar. The 525 breweries produced 9,712,625 hectolitres of beer and 892 distilleries produced 580,010 hectolitres of spirits. The livestock on Jan. 1, 1927, included: Cattle, 4,691,320; horses, 740,202; pigs, 2,539,201; sheep, 861,128; and goats, 1,244,701.

The mineral production comprises both soft and hard coal, iron, graphite, garnets, gold, silver, copper, and lead. The 332 coal mines, which employed 118,288 persons, produced in 1926, 18,789,098 tons of lignite and 14,507,596 tons of hard coal.

The manufacture of glass is one of the oldest industries in the country. It has been estimated that the factories have an annual manufacturing capacity of 415,000 tons of hollow glass, 132,000 tons of plate and window glass, and 187,000 tons of special glass. Other important and active industries of the country are the manufacture of china and textiles, leather working, and brewing.

COMMERCE. The following table from *The Statesman's Year Book* for 1928 gives the principal articles of import and export in 1926 and 1927:

Imports	1926	1927
	1,000 Crown	1,000 Crown
Cereals	1,870,175	2,172,000
Cottons	2,123,750	2,659,000
Woollen Goods	1,573,359	2,040,000
Fats and Oils	669,082	626,000
Iron Goods	422,204	519,000
Machinery	461,599	473,000
Exports		
Woollen Goods	1,610,730	2,085,000
Cottons	2,484,486	3,071,000
Wood, coal, peat	1,751,776	2,032,000
Glass	1,168,994	1,144,000
Sugar	2,247,162	1,525,000
Iron and iron goods ..	1,253,939	1,619,000
Cereals, milled products	781,436	1,000,000

FINANCE. No later figures for finance were available than those for 1927 when the ordinary and extraordinary revenues totaled 9,723,914,000 crowns and the ordinary and extraordinary expenditures totaled 9,703,505,000 crowns. The national debt, according to that budget, was placed at 34,945,000,000 crowns.

COMMUNICATIONS. There are 8522 miles of railway line in the Republic, of which 6849 are owned by the State and the remaining 1592 miles privately owned, 12 miles owned by foreign states, and 69 miles owned by foreign railways.

Revenues equivalent to approximately \$126,029,400, an increase of about \$8,211,700 over 1926 receipts, were reported by the Czechoslovakian railways for 1927. As compared with the preceding year, passenger traffic decreased about 3 per cent while during the same period the carloadings of freight traffic increased by 539,612 cars to 1927 total of 6,127,814. Of this total, 5,435,482 cars were destined to stations within Czechoslovakia while the remaining 692,332 were forwarded to other countries.

GOVERNMENT. According to the constitution adopted by the National Assembly, Feb. 29, 1920, executive power is vested in a president, elected for seven years by the two chambers in joint session, who appoints and recalls his ministers; and legislative power in a senate of 150 members elected for eight years and a chamber of deputies elected for six years, the former elected by all citizens over 26 years of age and the latter by all citizens over 21 years of age. The principle of proportional representation is applied. President in 1928, Thomas G. Masaryk (elected May 28, 1920; reelected May 27, 1927). The Czechoslovak Government, appointed on Oct. 12, 1926, consists of the following ministers: Prime Minister, Antonín Švehla; Foreign Affairs, Dr. Eduard Beneš; Finance, Dr. Karel Engliš; Interior, J. Cerný; Commerce, F. Peroutka; Public Works, Dr. Franz Spina; Railways, Josef Najman; Social Welfare, Jan Šrámek; Justice, Dr. Roberts Mayr-Harting; Agriculture, Dr. Otakar Srdínko; Education, Dr. Milan Hodža; National Defense, František Udržal; Posts and Telegraphs, Dr. F. Nosek; Health, Dean Tiso (January, 1927); Unification of Laws, M. Gazík.

HISTORY. Czechoslovakia passed through a very quiet and prosperous year. The voice of the minority parties was stilled by the continued coalition of the Czechs and Germans. During the summer a naturalization treaty was signed between Czechoslovakia and the United States, by the terms of which each country recognized the complete expatriation of subjects upon naturalization in the other country. See **ARCHAEOLOGY**.

DAESCHNER, NOSKY-GEORGES-HENRI-ÉMILE, French diplomat, died at Paris, December 13. Born Jan. 3, 1863; he studied law, and, although admitted to the bar, entered the diplomatic service, being appointed attaché to the political division of the Foreign Office in 1887. He was made attaché to the Embassy at London in 1898, having his rank raised from second- to first-class secretary two years later. M. Daeschner served from 1905 until 1906 as chief in Théophile Delcassé's cabinet. On leaving the administration, he became secretary to the Embassy at Madrid, and in 1908 received a similar post at London. Appointed Minister Plenipotentiary, he was assigned to Lisbon in 1913, and to Bucharest in 1920. While directing the administrative bureau of the ministry of foreign affairs, he was chosen to succeed Jules Jusserand as Ambassador to the United States, in January, 1925. In spite of his popularity he was recalled in 1926, and on returning to France was appointed Ambassador to Turkey. M. DAESCHNER retired in April, 1928, and was awarded the Grand Cross of the Legion of Honor.

DAHOMÉY, dà-hô'mí. A French colony on the west coast of Africa between Togoland on the west, the British possessions of Lagos and Nigeria on the east, and the French military territories on the north. It is a subdivision of

the colony of French West Africa (see **FRENCH WEST AFRICA**). The colony has only about 70 miles of coast, but opens out northwards into a wide hinterland. Area, 42,460 square miles; population, according to the census of 1925, 970,609, of whom 900 were Europeans. The chief centre of trade and the seat of the Government is Porto Novo with a population of about 20,000. The population is of pure negro blood, and belongs to the Ewe family. They are very industrious and engage mainly in agriculture. In the coastal region they raise potatoes, corn, manioc, and yams. In the central provinces, cotton culture has been introduced. The forests contain oil palms of commercial importance. The chief exports are palm oil and palm kernels. Imports in 1926 amounted to 186,537,810 francs; exports, 181,704,213 francs. The local budget for 1926 was 19,102,000 francs.

DAIRYING. Conditions in the dairy industry were generally favorable during 1928. The production of dairy products in the United States was not sufficient to supply the increasing demand. Notwithstanding a small increased production, there was in 1928 an import balance equivalent to approximately a billion pounds of fluid milk. The total production of butter and evaporated milk showed a slight decrease, and dry milk, ice cream, and cheese production increased, the last approximately 14 per cent, according to the latest available estimates. The better organizations of dairymen and the coöperative marketing of dairy products, especially fluid milk, with special methods for handling the surpluses in the seasons of heavy production since the War and during the period of agricultural depression, placed dairymen in a relatively strong position as compared with many other agricultural enterprises. Plentiful feed with satisfactory prices for dairy products yielded fair returns to producers. There was a considerable shift in dairy-producing areas toward the South, due at least in part to the relatively high prices paid for market milk which is now being shipped considerable distances from sections which originally produced butter and cheese.

Prices for butter were well maintained throughout 1928, with the possible exception of the period in September and October when there was temporary evidence of some uncertainty. At nearly all times the differences between the New York and London markets were approximately 10 cents per pound, which, with the tariff of 12 cents, prevented appreciable imports.

During 1928, there were 4,659,288 pounds of butter imported as compared with 8,459,741 pounds in 1927. There is annually a considerable amount of cheese imported from the European countries, which, in 1928, amounted to 81,402,073 pounds. This was comparable to the cheese imports in 1927. Nearly all of the cheese imported is of special kinds on which a premium is placed for the imported product. Twenty-eight million pounds of the 1928 importation came from Italy and nearly 19,000,000 pounds from Switzerland.

The United States exported a very large amount of condensed, evaporated, and dried milk. The exportation in 1928 was heavier than in 1927, particularly for unsweetened evaporated milk, of which 76,788,833 pounds were exported in 1928 as compared with 68,047,141 pounds in 1927. The corresponding amounts of sweetened condensed milk exported in the respective years were 38,762,549 and 34,981,081 pounds. The large-

est amount of unsweetened evaporated milk going to any single country was nearly 27,000,000 pounds to the United Kingdom, but the Philippine Islands took nearly 16,000,000 pounds of evaporated milk and 8,000,000 pounds of sweetened condensed milk.

INTERNATIONAL CONDITIONS. Conditions were unusually favorable in practically all the important dairy-producing countries of the world. Fall production in Denmark was expected to exceed that of 1927. The three months' production, August to October, in 1928 slightly exceeded the production in the corresponding months of 1927. For the first two months of the season of production in New Zealand, estimates indicated an unusually heavy production of butter and cheese. The butter gradings exceeded those of the previous year by 13 per cent and the cheese gradings by 37 per cent. The conservative commercial estimate was a 10 per cent increase in the production of dairy products in New Zealand for the 1928-29 season. There was 60 per cent more butter received at the principal grading ports during August, September, and October of 1928, than in the corresponding period of 1927. The Netherlands continued to expand its production, as did Argentina. The butter imports of Germany and Great Britain, and the cheese imports of the latter country, showed considerable increase as compared with 1927. They were evidently profiting by the heavy production in the Southern Hemisphere, obtaining surpluses for future demand. Reports also indicated that dairying in Russia was rapidly recovering from the effects of the World War.

The limitation in the imports of dairy products as a result of the tariff of 12 cents per pound on butter and 37.5 per cent ad valorem on Swiss cheese no doubt had an important effect on the prices of dairy products in the United States. Otherwise, the heavy world production would have resulted in sufficient importation to lower prices considerably.

TRENDS IN RESEARCH. The increase in the consumption of dairy products resulted in part, at least, from the greater appreciation of the nutritive properties of these foods which has been experimentally demonstrated in investigations reported during the last few years. Because of their high nutritive value, considerable interest has arisen in the development of more varied ways of utilization and improvement of the quality and desirability of products already known. Striking examples of this may be drawn from the much increased consumption of chocolate milk, a product which a few years ago was practically unknown; and the much increased use of ice cream as a part of the standard diet. The use of other dairy products, particularly buttermilk and other types of fermented drinks, was also striking. The development of the chocolate-milk trade involved the matter of settling of the chocolate and producing an unattractive product when bottled for some time. The wheying off of buttermilk tends to detract from its stability. These problems were largely solved, the former by the use of improved chocolate preparations, and the latter by the addition of small amounts of gelatin.

Many of the State experiment stations and the United States Department of Agriculture conducted experiments on the effect of various ingredients and changes in the portions of the fat, milk solids-not-fat, and other ingredients in

the production of ice cream. A mix with an 8 to 10 per cent solids-not-fat content has generally been found to give the most desirable product from the standpoint of smoothness of texture and firmness of body. Mixes containing larger amounts of fat scored well in flavor, body, and texture, but the overrun was reduced. Ice cream with a low fat content deteriorated in quality during the storage period. The fat and serum solids content of the mixture have little effect upon the whipping quality. Homogenization and aging for 24 hours were generally found to improve the whipping quality of the mix and the smoothness in texture of the frozen product.

The destruction by pasteurization of bacteria causing fermentation in milk for cheese making and cream for butter making, with the subsequent inoculation of the desired types of organisms, generally give the best results, particularly from the standpoint of the flavor after storage. The use of the holder method of pasteurization in cheese making gave a better yield than the flash or flash-holder methods. The addition of a small amount of calcium chloride to the milk from which Cheddar cheese was made increased the yield and the amount of fat incorporated in the cheese. Less rennet was also required for the necessary coagulation.

In studies at the Illinois station of the cause of feathering of cream, it was found that heat precipitated calcium caseinate. Water containing calcium salts also caused a disturbance in the salt balance and resulted in feathering. Sodium citrate reduced it, while calcium chloride increased the precipitation upon the application of heat. Variations in the feathering of different samples were attributed to different stages in the lactation period, resulting from the fact that cows produced milk with a higher mineral content just after freshening and toward the end of the lactation period.

CHANGES IN PERSONNEL. The more important changes in personnel during the past year in the dairying field included the resignation of Prof. E. L. Anthony, head of the department of dairy husbandry at the West Virginia University and Experiment Station, to accept the appointment as head of the division of dairy husbandry at the Michigan Agricultural College, left vacant by the resignation of Prof. O. E. Reed, who became Chief of the Bureau of Dairying, of the U. S. Department of Agriculture. Prof. A. D. Pratt was appointed professor of dairy husbandry at the Connecticut Storrs Agricultural College. O. G. Schaefer, professor of dairy husbandry and dairy husbandman at the Minnesota University and Experiment Station, resigned to engage in commercial work, as did Prof. G. D. Turnbow, of the California University and Experiment Station.

BIBLIOGRAPHY. The more important reference books on dairying, recently published, include: C. W. Larson and F. S. Putney, revised by H. O. Henderson, *Dairy Cattle Feeding and Management* (New York and London, 1928, 2d ed., rev.); P. Coche, *La Production Latière en Danemark* (Paris, 1928); *Fundamentals of Dairy Science* (a treatise by associates of L. A. Rogers New York, 1928); O. Rahn and P. F. Sharp, *Physik der Milchwirtschaft* (Berlin, 1928); E. H. Farrington and F. W. Woll, *Testing Milk and Its Products* (Madison, Wis., 1928, 27th ed., rev. and enl.); L. L. Van Slyke, *Modern*

Methods of Testing Milk and Milk Products (New York and London, 1927, 3d ed., rev.); A. Miyawaki, *Condensed Milk* (New York and London, 1928); L. L. Van Slyke and W. V. Price, *Cheese* (New York and London, 1927); C. D. Dahle, *A Manual for Ice Cream Makers* (Atlanta, Ga., 1927); G. D. Turnbow and L. A. Raffetto, *Ice Cream* (New York and London, 1928); A. C. Baer, *The Preparation and Processing of Ice Cream Mix* (Milwaukee, 1927).

DALE, ALAN (ALFRED J. COHEN). American dramatic critic and playwright, died in England May 21. He was born at Birmingham, England, May 14, 1861, and was educated at King Edward's School, Birmingham, and Oxford University. He went to New York in 1887, and became dramatic critic of the *New York Evening World*, remaining with that newspaper until 1895, when he accepted a similar position with the *New York Journal*. From that time until his death he was a member of the Hearst newspaper organization, except for a brief period in 1914. In point of continuous service, Mr. Cohen, who wrote over the name "Alan Dale," was the oldest dramatic critic in New York City at the time of his death. Besides his criticisms, which were written in a characteristically bright and caustic style, he wrote books, plays, and magazine articles.

DALMATIA. A province of Jugo-Slavia; a crownland of Austria until the downfall of the Dual Monarchy in 1918. It extends from Bosnia and Herzegovina west to the Adriatic Sea. Area, 4916 square miles; population, according to the census of Jan. 31, 1921, 621,429. Capital, Zara, with a population in 1921, of 8060.

DALZIEL, LORD, FIRST BARON DALZIEL OF WOOLER (DAVIDSON DALZIEL). British capitalist, died at London April 18. He was born in October, 1854. He was at first a journalist, in San Francisco, New York, and London, and established the Dalziel News Agency in the last named city, taking over the old *Morning Standard* and also the *Evening Standard*. His newspaper ventures proving only moderately successful, he turned his attention to the field of railways, and gradually acquired control of the International Sleeping Car Company and the British Pullman Car Company. These ventures were crowned with success, and one of the latest moves of Lord Dalziel in the field of transportation was the merger of his sleeping car company with Thomas Cook & Sons. He was the first man to introduce taxicabs on the streets of London. He was a member of the House of Commons from 1910 to 1923. For his services in the World War he was created a baron in 1918, having been knighted in 1908, and in 1927 he was raised to the peerage. He was an officer of the French Legion of Honor and a commander of the Order of the Crown of Italy.

DAMS. While great dam constructions were under way in many sections of the world, perhaps the most important two items of the year were the lessons learned from the St. Francis Dam catastrophe in California and the discussion of the Boulder Dam Project. The former focused attention on dam construction and on the design of such works. The latter involved economic as well as engineering problems of the first magnitude.

Studies of the St. Francis Dam seemed clearly to indicate a foundation failure, although the chief engineer, who had had long experience in dam construction, stated he was unable to account for the failure, and the theory that it

was caused by landslides from the side walls of the Canyon was advanced. Briefly stated, this failure showed that no matter how highly developed the theory of design may be in the matter of form and thickness of the dam cross-section, the character of the foundation, its ability to carry the load of the structure and to remain water tight under high-water pressure, is one of the main factors governing the design. This problem, unfortunately, is largely a matter of judgment and cannot be solved by mathematical or similar analysis. Designers are tempted, or even in some cases forced, to take chances with risky foundations due to economic pressure and lack of funds. The decision rests largely on experience and opinion and these are human factors which cannot be ignored. It seemed probable that this great and unfortunate catastrophe would result in legislation leading to more complete control of such constructions. It at least showed the need for expert advice from competent engineers, assisted by such aid from geological studies and borings as are essential, and that the decision in great works should not be left to one man but should represent the consensus of opinion of several experienced and expert advisers.

The provisions of the Boulder Canyon Bill, as finally passed just at the close of the year, commits the Federal Government to an expenditure of \$165,000,000. It is estimated to require seven years for completion, and involves the construction of the highest dam ever attempted by man—550 feet.

GRAVITY DAMS—THE ST. FRANCIS DAM DISASTER. On the night of March 12-13, 1928, the ends, or wings, of this 205-foot high, arched, gravity type of concrete dam, gave way, bringing death to some 450 people in the valley below, sweeping away a power house, bursting an aqueduct, and doing millions of dollars' damage to roads, railroads, farms, etc. A central portion of the dam, about 100 feet long (the total length was 650 feet) remained standing but both wings were wrecked by the release of the 38,000 acre-feet of water held in the reservoir. The torrent, said to have been 100 feet deep, carried huge portions of the structure almost half a mile down the valley.

The dam was located in the San Francisquito Canyon about 1½ miles above Power House No. 2 of the Los Angeles Municipal Power Bureau and roughly 45 miles north of the city of Los Angeles. Completed early in 1926 and built to provide storage for the Los Angeles aqueduct water for use in years of deficient run-off, it was practically full at the time of failure. Although some seepage had occurred around the dam, an investigation the day before the disaster showed clear water with no indication of erosion.

In general the reports of the many committees which investigated the failure agree in stating that the dam was of ample cross-section and was built of good materials so that its failure in no way reflects on the safety of this type of structure when built on adequate foundations. On the other hand, a fault classed as dead and in which no movement took place at the time of failure, passes through the dam site and results in the adjoining rock masses being badly shattered. These rocks consist of a mica schist of very poor quality and a rock described as red conglomerate and supposed to

have been formed of gravel loosely cemented with gypsum. Both materials, particularly the latter, have been found to soften under water. It is difficult, therefore, to state positively that any type of dam would have been absolutely safe at this site and it is even more clear that it was not a suitable foundation material for the gravity type; a type which requires a solid bed-rock base due to the high and unequal pressure exerted by this particular form of dam on its foundation.

BOULDER CANYON DAM. After much discussion and difficulty, the so-called Boulder Dam Bill passed the Senate on December 14, the House on the 18th, and was signed by the President on the 21st.

The fundamental difficulties connected with this work had to do primarily with the respective interests in it of the seven States involved. Arizona, in particular, was convinced that California was attempting to grab the lion's share of the irrigation and power benefits involved and, although California had available a practically immediate market whereas Arizona was sparsely settled with only a small percentage of her territory privately owned, she naturally insisted on a share in the benefits. As finally passed, the bill authorized Arizona, California, and Nevada to enter into an agreement providing that the $7\frac{1}{2}$ million acre-feet to be apportioned annually to the lower basin of the Colorado River may be divided so that Arizona will receive 2,800,000 acre-feet for "exclusive beneficial consumption" (that is, diversion less return of water to the river) in perpetuity. Nevada was to have 300,000 and California's share was not to exceed 4,400,000 acres-feet. Arizona also receives exclusive use of the Gila River within its territories. California also has a one-half share of any surplus over the $7\frac{1}{2}$ million estimated annual flow at Boulder Canyon. No work may be begun within six months unless all States ratify the Colorado River compact, but after this time six States, which must include California, may suffice to ratify.

Another bone of contention was the matter of water power. It was argued that this project, involving as it does the use of the water for power, would necessitate the Government going into the water-power business. The bill provides that the Secretary of the Interior, at his discretion, "may enter into contracts of lease of any unit or units of any government-built [water-power] plant, with right to generate electrical energy or alternatively to enter into contracts of lease for the use of water for the generation of electrical energy."

The Secretary of the Treasury was authorized to advance to the Colorado River Fund amounts not to exceed \$165,000,000 of which \$25,000,000 is on the score of flood control. See under UNITED STATES, *Seventieth Congress, Second Session*.

The main features of the project are the dam, the power house, and the canal. The bill contains several conditions relating to these. Before the dam can be built or the power house begun, the offers for power must be large enough to repay the money to be spent by the Government (less the flood control item) with 4 per cent interest. The canal is to be built and paid for under the provisions of the Reclamation Law and, provided the Imperial and Coachella valleys, the principal areas interested, are

prepared to pay the entire cost, contract for the canal could then be let.

Earlier in December a report from a special board of engineers and geologists appointed under resolution of Congress, advised that dams 550 feet high to impound 28,000,000 acre-feet of water were feasible at both the Boulder and at the Black Canyon sites. The latter site was recommended, however, as had previously been done by the engineers of the Bureau of Reclamation. A more conservative design than that proposed was approved in that, while both bodies advised the gravity type, the special board recommended that the maximum stress be limited to 30 tons per square foot instead of 40. Tunnels are to be used to divert the flow of the river around the site during construction. Here again the special board considered the Board of Review plans for three tunnels 35 feet in diameter to carry 100,000 sec. feet inadequate and recommended doubling this capacity. A larger spillway for floods is also advised. The All-American Canal was found to be feasible although it was recommended that the relations as regards Mexican and American water rights in the river be settled by agreement before the project was put under construction. The proposed canal will run from a point on the Colorado at Laguna Dam, about 23 miles above the present Imperial Canal intake, to the Imperial Valley and will involve, in one portion of 10 miles, protection from blown sands. The estimates of the special report were based on a construction period of seven years.

SAN GABRIEL DAM. The Los Angeles County Flood-Control District called for bids in November for the construction of a high dam at the forks of the San Gabriel Canyon and work is expected to be under way at an early date. The project has as its object the relief of flood conditions and the plans have been held up for over three years pending arrangements for financing. The dam site is about 30 miles east of Los Angeles and the dam, a very high structure (425 feet above stream bed and about 500 feet above foundations) was to be of the gravity-arch type. A storage capacity of 240,000 acre-feet will be developed and almost 3,800,000 cu. yards of concrete will be required (about three times the quantity used in the much discussed Muscle Shoals Dam). Irrigation water being much in demand in the area below the dam, it was planned to serve for this use as well as for the primary purpose of flood relief. With this end in view the lower 157,000 acre-feet will be used for impounding water for irrigation, while the upper 83,000 will be held available at all times for flood relief through storage.

OWYHEE DAM. At a point known as the Hole in the Ground about 21 miles southwest of Nyssa on the Union Pacific Railroad, the United States Bureau of Reclamation was planning to build a remarkably high gravity-arch-type dam. A reservoir will thus be formed which will have a total capacity of 1,120,000 acre-feet and will form the principal storage for the Owyhee Reclamation Project embracing some 120,000 acres in eastern Oregon and western Idaho. Steep canyon walls permit a comparatively short dam, in the main portion about 300 to 500 feet with a top length of between 800 and 900 feet to be carried up to the remarkable height of 520 feet above the lowest concrete of the deep foundation cut-off on an average of 390 feet above the gen-

eral foundation level. Contraction joints will be placed at intervals of 50 feet in the length of the dam and inspection galleries will be provided in the body of the structure which will be 20 feet thick at the top and probably about 300 feet at the base. Following, as this work did, the St. Francis disaster, great attention was paid to investigations of the foundation and experts have agreed upon this point. Work was to be under way in 1929.

ARCH DAM INVESTIGATIONS. The growing use of the arch dam, a type which relies for its stability on its curved form and arch action rather than simply on its weight as in the gravity form, resulted in an appeal to the American engineering societies represented by Engineering Foundation for aid in the solution of the problem. Such dams are particularly economical, indeed only suitable, where very steep side walls, such as are found in the canyons of the western United States, form the required "abutments" for the arch. The stability of such a structure, depending on a complicated combination of arch, gravity, and cantilever actions, being difficult of analysis, a special "test dam," the Stevenson Creek Dam, was built for testing at various heights with various depths of water. See YEAR BOOKS for 1923, 1924, 1925, and 1926. Studies of a model by the methods developed by Professor Beggs of Princeton combined with the results of the Stevenson Dam tests indicate that a clearer conception of the manner in which such dams support their load is being secured. Hope was expressed that a rational method of design may be developed for these structures with a consequent increase in safety and at the same time a reduction in thickness and cost.

TOLTEC DAM, NEW MEXICO. An interesting example of the possibilities of winter concrete construction under adverse conditions was afforded by the construction of this small arch dam (500 feet long, 78 feet high above stream bed) in the Zion Mountains in New Mexico at an elevation of 8000 feet. By using water heated to 200° and a torch in the mixer, concrete was delivered to the forms at 85° through an open-air chute and was protected by tarpaulins and warmed by salamanders.

MAENTWROG DAM, WALES. This British arch dam is not of any unusual dimensions or construction, but is one of the first European examples of the use of this American type. It is part of an extension, or additional development, of the North Wales Power and Traction Company which was organized in 1904 to supply power to a limited area in North Wales and vicinity. The original plant was a small one operating, however, under the remarkable head of 1130 feet. The new, additional plant will supply water to turbines of 15,000 kw. capacity and the district served by the company has been extended to 4080 sq. miles. It is located in an area of very high rainfall, the Snowdon Range in Wales, where the annual precipitation runs as high as 125 inches.

The Maentwrog Dam, one of four such structures, is of the arch type about 350 feet long and 90 feet high above stream bed or 115 feet above foundations. The dam section is of concrete, with a vertical upstream face, a downstream slope of 1 in 2½, and a constant radius of 210 feet. After passing through a 10-foot tunnel 1960 feet long and a low-pressure riveted steel pipe 9½

feet in diameter, of ¾- to ½-inch thickness, about 1 mile long, there is another short tunnel to the main pressure line, 6 feet in diameter, and the power house, where a head of 650 feet is obtained.

SPECIAL DAMS—LAKE PLEASANT DAM, ARIZONA. A multiple-arch concrete dam 2146 feet long and 170 feet high above stream bed was completed in 1927 some 35 miles northwest of Phoenix, Arizona. The dam creates a storage reservoir of 173,000 acre-feet for irrigation and power purposes to serve the 40,000 acre project of the Maricopa County Municipal Water Conservation District No. 1. In order to secure sufficient slenderness ratio, the buttresses, 60 feet centre to centre, were built shallow, with double walls 16 feet wide for their full height and battered inside. The clear span of the arches is thus 44 feet, the upper side of the buttresses being closed by flat slabs. The up-stream slope is 9 horizontal to 10 vertical and the arches are 3-centred with a thickness varying with the height. The unique construction and the great height, 252 feet maximum above foundations, made this one of the most notable dams of this type. See description in *Engineering News-Record*, Feb. 2, 1928.

COOLIDGE MULTIPLE-DOME DAM. One of the most interesting and remarkable dams of a novel type ever constructed was this work nearing completion on the Gila River in Arizona. It is an essential part of a project authorized in 1924 to irrigate some 100,000 acres largely Indian lands adjacent to the Salt River Project in Arizona and was being built by the United States Indian Service. Several studies of different types of dam, together with estimates of their relative economy, showed a slight saving for the novel dome type over its nearest competitor, the well-known multiple arch. Three egg-shaped half-domes of 180 feet span and 251 feet high, with joining buttresses, form the main portion of the dam which is about 550 feet long with side hill spillways on either end 166 feet wide. It was claimed that this type offered advantages for certain sites and is subject to comparatively simple calculation. The domes vary in thickness from 4 to 20 feet and are reinforced for temperature changes, no expansion joints being provided except in the buttresses. Under the central dome of the dam a 10,000 kw. hydro-electric power plant is to be built.

STONY GORGE DAM. This work, also a United States Bureau of Reclamation project, illustrates the use of another type of dam. It is a 120-foot-high slab and buttress-type reinforced concrete structure and was being built by the Ambursen Company, being practically completed at the end of 1928. This dam is on the Orland project in California and will furnish a supplemental supply to 20,000 acres already under irrigation.

EARTH DAMS.—HIGHEST HYDRAULIC-FILL DAM, COBBLE MOUNTAIN, MASS. The new Cobble Mountain dam of the Springfield, Mass., Water Works was designed to contain 1,800,000 cubic yards of earth and to be the highest earth dam ever built—245 feet above bed rock—as is shown in the accompanying table of earth dams.

This dam forms part of the additional supply system for this city being developed on Little River, a branch of the Westfield, west of Springfield and above the existing system. The dam

<i>Dam</i>	<i>Spillway ht. above stream bed</i>	<i>Total ht. above stream bed</i>

Paddy Creek, N. C.	120	130
Gatun, Panama	78	120
A record dam of the rock-fill- earth type is Dix River ..	245	275

was to be located in a narrow gorge and, although 1505 feet wide at the base (toe to toe) was to be only 700 feet long at the crest. Some 22 billion gallons storage is expected and the lake will cover 1120 acres. A separate spillway 800 feet long is provided and a diversion tunnel, 1600 feet long, will be used to carry flows around the dam site during construction and later as an outlet for the dam. Another outlet tunnel, 7105 feet long and $9\frac{1}{2} \times 10$ feet horseshoe section, will convey the water to a point lower down in the gorge at existing works giving a head of 450 feet for power development. Suitable material for the dam was to be hauled about one mile and either was to be sluiced into place from "dissolving boxes" or placed by the semi-hydraulic method of dumping dry at the outer edges and washing into place. It is expected that the work will be completed by October 1930.

TABLE ROCK COVE EARTH DAM. That the stability of the earth embankments of an hydraulic-fill earth dam during construction needs careful observation and attention was amply demonstrated in the slide on the 180-foot Nexaca Dam in Mexico in 1909 and through other similar construction difficulties with this type. In the earth water-supply dam for Greenville, S. C., built in 1925-27, however, another source of danger almost caused a major disaster. The dam was a rolled-fill embankment, not a hydraulic structure, and 140 feet high above foundations. A 42-inch drain pipe, used to divert the stream flowing during construction, was closed by a valve at its lower end, at the downstream toe of the dam. A break in this drain, which, of course, was under full water pressure, caused a large slide in the dam with the reservoir almost full. The dam held while the stored water was slowly drawn off.

DANISH LITERATURE. See **SCANDINAVIAN LITERATURE.**

DANZIG. A free city, which, with its surrounding territory, was established by the Treaty of Versailles in 1919. It was formerly a part of the German Empire. Area, about 754 square miles; population, Aug. 31, 1924, 384,000. The administrative district of the City of Danzig had a population of 207,100. The city is the chief outlet for the commerce of Poland and continues to maintain its century-old position of being the leading grain port of the Baltic. Shipping is the chief industry, manufacturing being engaged in largely for local consumption.

In 1926, 5967 vessels of 3,432,480 tons entered and 5963 vessels of 3,395,840 tons cleared from the port. During the calendar year 1927, 1,517,194 tons of goods were imported through Danzig and 6,380,419 tons exported. Figures for the first

half of 1928 indicated that the totals for that year would be much greater both for imports and exports. The budget for the fiscal year Apr. 1, 1927, to Mar. 31, 1928, balanced at 113,209,220 gulden. The government of the free city is in the hands of a High Commissioner appointed by the League of Nations. Its constitution approved by the League May 11, 1922, provides for a legislative assembly of 120 members elected for four years, a senate consisting of 20 members, and a president and vice president. The senate is the highest authority in the city and holds secret sessions. High Commissioner in 1928, Dr. Van Hamel.

DARTMOUTH COLLEGE. A non-sectarian institution for the higher education of men, at Hanover, N. H.; founded in 1769. The 1928 autumn session had an enrollment of 2244 students, most of whom were working for the regular college degree, the exceptions being: 20 graduate students; 39 in the medical school; 17 in the Thayer School; and 106 in the Tuck School. There were 261 members on the faculty. The productive funds amounted to \$10,000,000. The library contained 240,000 volumes. During 1928 the Fisher Ames Baker Memorial Library, the gift of George F. Baker of New York, was completed at a cost of \$1,000,000, also a laboratory for the natural sciences, and a new dormitory; while the Carpenter Art Building, the Sanborn English House, and two dormitories were under construction. Admission to Dartmouth College is effected under a selective process, with due weight given to scholarship, character, qualities of leadership, and apparent ability to profit by a college education. A revised system was in force during 1928, providing, among other things, for special treatment for students of high grade and for the granting of but one degree, Bachelor of Arts. President, Ernest Martin Hopkins, A.M., Litt.D., LL.D.

DATE SCALE ERADICATION. See **ENTOMOLOGY, ECONOMIC; HORTICULTURE.**

DAVIES, ARTHUR B. American painter, died in Italy, Oct. 24. Born at Utica, N. Y., in 1862; he studied under Dwight Williams and at the Art Institute, Chicago, and at New York, following the romantic school of painting. He first exhibited at the International Society of Sculptors, Painters, and Gravers, in London. The originality of his painting was recognized at his opening New York exhibition, in 1899. He thereafter avoided regular annual exhibitions, but arranged special displays throughout the United States, notably: that at New York in 1901 in which "Spring's Renewal," and "The Breath of Light" appeared; that at the Pennsylvania Academy of Fine Arts, in 1908, which included "The Girdle of Ares," acquired by the Metropolitan Museum of Art in 1914, and "Visions of the Sea"; and that at the Art Institute of Chicago in 1911, showing "Maya, Mirror of Illusions," purchased by the Institute, and "The Hunter of Starlands." Mr. Davies was also represented in other permanent collections, one of the most important groups being his four paintings, including "Children of Yesterday," which hang in the Brooklyn Museum. He won the silver medal at the Buffalo exposition in 1901, received honorable mention at the Carnegie Institute, Pittsburgh, in 1913, and in 1916 was awarded the first W. A. Clark prize, and the Corcoran gold medal.

Mr. Davies was considered by many a leader in imaginative painting, and one of the most individual of the American artists, although his critics believed that his abstract depictions were slightly precious. His coloring and tonal effects were not excelled by the "modernists" whose work he encouraged and whose influence was noted in the mathematical construction of his later paintings. He was largely responsible for introducing the modernists to the American public by leading in the organization of the International Exhibition at New York in 1913. The following year Mr. Davies exhibited a series of his own cubist paintings, including, "The Great Mother," at the Montross Gallery, N. Y. Others of his later romantic, but more intellectual paintings, are "Sea, Wind, and Sky"; "Strewing Dust"; and "Orchard of Pleasant Bounties."

DAVIES, DAVID CHARLES. American museum director, died at Chicago, Ill., July 14. He was born at Aberystwith, Wales, July 23, 1866, and was educated at the University College School, London, and at the University College School of Wales. He went to the United States in 1888, and was employed by Marshall Field & Company of Chicago as a clerk. Soon afterward he became a bookkeeper, and in 1894 he became connected with the Field Museum of Natural History, Chicago, as an accountant. Mr. Field chose him to install a system of accounting at the museum and later he devised recording and purchasing systems. He became first secretary of the museum and then director and a trustee in 1921. He received much of the credit for the high place of the museum in the world of science and exploration.

DAVIS, HENRY WILLIAM CARLESS. English historian and biographer, died at Edinburgh, Scotland, June 28. He was born in 1874, and was educated at Weymouth College and at Balliol College, Oxford, of which he was a scholar in 1891-95, and became fellow in 1902 (after being fellow of All Souls' from 1895 to 1902). In 1925 he was elected an honorary fellow of Balliol and a fellow of the British Academy. He was professor of modern history at the University of Manchester, 1921-25, and was made regius professor of modern history at Oxford in 1925 and curator of the Bodleian Library in 1926. As a historian his work was marked by solid scholarship, and he possessed the gift of making his writings readable and interesting to the layman. He was highly regarded at Oxford and elsewhere as an adviser of his students and a guide into the fields of research. From 1902 until his death he was director of the *Dictionary of National Biography*. During the World War, Professor Davis served in the War Trade Intelligence Department and on the War Trade Advisory Committee, and won the decoration of a Commander of the Order of the British Empire. Professor Davis published a long list of works, especially on mediæval history, and contributed to the *English Historical Review*, *The Cambridge Modern History*, *Helmholtz's History of the World* (English edition), and *Mowbray's Dictionary of Church History*. Among his books may be mentioned: *History of Balliol College* (1899); *Charlemagne* (1900); *England Under the Normans and Angevins* (1905); a manual on *Mediæval Europe* (1911); *Regesta Regum Anglo-Normannorum* (1913); a new edition of *Stubbs's Select Charters* (1913); *Political Thought of Treit-*

schke (1914); (in collaboration with others) *Why We Are at War* (1914). He also contributed to the *History of the Peace Conference* (ed. Temperley, 1920, etc.). He edited *Oxford Pamphlets* (1914-15).

DAVIS, SIR MORTIMER BARNETT. Canadian capitalist, died at Cannes, France, March 22. He was born at Montreal, P. Q., in 1866, and was educated at the public and high schools of his native city. He was one of the leading financiers of the Dominion, and was frequently termed "the tobacco king of Canada" and "the Rockefeller of Canada." He was president of the Imperial Tobacco Company of Canada, Ltd.; chairman of the Canadian Industrial Alcohol Company, Ltd.; a director of the United States Rubber Company; chairman of the Consolidated Asbestos Company, Ltd., and had extensive interests in other industrial concerns, as well as being a director of the Royal Bank of Canada and of the Crown Trust Company of Montreal. He was deeply interested in horse racing, and owned several horses which won important stakes on the turf of America and Europe. His gifts to philanthropic institutions were numerous and large.

DAWES PLAN. The fifth annuity year under the Dawes Plan began Sept. 1, 1928. This date marked the first year in which the standard annuity of 2,500,000,000 gold marks was payable and was regarded as the test year of the plan. The Agent-General of Reparations Payments announced that in the fourth year of the Dawes Plan, which ended on Aug. 31, 1928, Germany had made all payments fully and punctually as they became due and that transfers had been made during the year to an amount substantially equivalent to the year's receipts.

The reparations payments actually received from Germany within the fourth annuity year amounted to about 1,746,000,000 gold marks, including two payments in completion of the third annuity, to the amount of 75,000,000 marks, which was not received until September, 1927. The fourth annuity itself amounted to 1,750,000,000 gold marks, and the two payments necessary to complete it fell due in September, 1928. The first of these payments, representing the final installment of the service of the German railway bonds, was made on September 1, to the amount of 55,000,000 marks. The final installment of the year's contribution from the transport tax, amounting to 24,000,000 marks, was paid on September 21.

The total transfers made during the fourth annuity year amounted to approximately 1,739,000,000 gold marks. The transfers in foreign currencies aggregated about 943,000,000 marks, or 54.23 per cent of the total transfers, while the transfers made by means of Reich mark payments in Germany amounted to about 796,000,000 or 45.77 per cent of the total transfers. Of the foreign currency transfers the largest item was 460,405,000 marks cash. At the close of business on Aug. 31, 1928, the cash balance in the Agent-General's account amounted to about 189,500,000 gold marks, as compared with the available balance of about 185,500,000 marks at the beginning of the year.

DAWSON, dō'sūn WILLIAM JAMES. English clergyman and author, died at Nelson, B. C., Canada, August 23. He was born at Towcester, Northamptonshire, Nov. 21, 1854. After he had left Didsbury College, Manchester, Dr. Dawson

entered the Wesleyan ministry in 1875. In 1892 he resigned to enter the Congregational ministry, and accepted an appointment at the Highbury Quadrant Congregational Church, London, which he held until 1904. He came to Washington, D. C., in 1891 as a delegate of the Methodist Ecumenical Council. He returned to America in 1905 and lectured throughout the United States. In 1912 he became pastor of the First Presbyterian Church of Newark, N. J., where he remained until 1925, when he was made pastor-emeritus. Dr. Dawson, who was the father of Coningsby Dawson, the author, in addition to his church and evangelical work, lectured frequently on history and literature, and wrote extensively in nearly every field of literature. His writings include: *A Vision of Souls* (poems, 1884); *Quest and Vision, Essays on Life and Literature* (1886, enlarged ed. 1892); *The Makers of English Poetry* (1890); *The Redemption of Edward Strahan, A Social Story* (1891); *London Idylls* (1895); *The Story of Hannah* (1896); *The House of Dreams* (1897); *Judith Boldero, A Tragic Romance* (1898); *Makers of English Prose* (1899); *Savonarola, A Dream* (1900); *The Man Christ Jesus* (1901); *The Reader's Library* (with his son, Coningsby W. Dawson, 1909); *The Book of Courage* (1911); *The American Hymnal* (1913); *America, and Other Poems* (1912); *Robert Shenstone; A Novel* (1917); *The Father of a Soldier* (1917); *The War Eagle* (1918); *Chalmers Comes Back* (1919); *The Borrowdale Tragedy* (1920); and *The Autobiography of a Mind* (1925).

DAY, WILLIAM A. American lawyer and capitalist, died at St. Augustine, Fla. April 9, at the age of seventy-seven. He was born at Wilmington, Del. He studied law at Harvard and afterward practiced at Champaign, Ill., of which town he was elected mayor in 1883. He served two terms in the Illinois Legislature, and in 1885 was appointed auditor of the U. S. Treasury Department. He remained in that office until 1889. As special assistant to the attorney-general of the United States (1901-03), he aided in and had charge of the prosecution of anti-trust cases under the interstate commerce and anti-trust acts. In 1904 he was sent as head of a mission to France to conclude the purchase of the Panama Canal, and on his return was sent by President Roosevelt to Alaska to investigate charges of oppression against government officials. Mr. Day served as vice president of the Equitable Life Assurance Society of the United States from 1906 to 1911 and as president until his retirement from that office in 1927. From that time until his death he was chairman of the board of directors of the society.

DEAF, SCHOOLS FOR. See EDUCATION.

DEAN, BASHFORD. American zoölogist and armor expert, died at Battle Creek, Mich., December 7. Born at New York, Oct. 28, 1867, he was graduated from the College of the City of New York, in 1886, and received the A.M. degree from Columbia in 1889, and the Ph.D. degree in 1890, also studying at Munich and Naples. Becoming a member of the Columbia faculty in 1891, he was instructor in biology until 1896, adjunct professor of zoölogy, 1896-1904, professor of vertebrate zoölogy, 1904-27, and honorary professor from 1927 until his death. He was also professor of fine arts at New York University in 1925. Being assistant on the New York State Fish Commission, 1886-88, he served on the United

States Fish Commission as assistant, 1889-92, and as biologist, 1900-01, making special investigations in Europe and Japan. Dr. Dean was a director of the biological laboratory of Cold Spring Harbor, N. Y., in 1890, and he became a member of the advisory board of the New York Aquarium in 1902. The American Museum of Natural History appointed him curator of herpetology and ichthyology in 1903, naming him honorary curator of the latter subject in 1926; the "Hall of Fishes," opened at the museum in December, 1928, was largely the result of his work. He began his association with the Metropolitan Museum of Art in 1903, and, as curator of arms and armor, brought this department into world fame, acquiring, by careful research, one of the most complete antiquary collections in existence. In 1927, he was made a trustee of the museum. Dr. Dean was also trustee of the New York Museum, president of the Dyckman Institute, and curator of the Dyckman House Museum. Besides belonging to several American scientific associations, he was a corresponding member of the zoölogical societies of Paris, Moscow, and London. He was awarded the Legion of Honor by France, in recognition of his contributions to zoölogy. As major in the Ordnance Department of the U. S. Army, and adviser on armor to the War Department, he was active during the World War, being sent in 1917 with a military mission to France, Belgium, and England. Dr. Dean wrote many books and papers on palæichthyology and embryology of fishes, including the textbook, *Fishes, Living and Fossil* (1895), and compiled a bibliography of fishes with 50,000 titles. He also published many dissertations on arms and armor.

DEATH RATE. See VITAL STATISTICS.

DECEPTION ISLAND. Deception Island (Lat. 63° S; Long. 60° 15' W.) near the northern extremity of Graham Land is a volcanic island into whose breached crater the sea has entered and provided an excellent land-locked harbor for the whaling vessels congregating in the adjoining waters each year. Fumaroles and hot springs give evidence of recent volcanic activity. This island was being used as a base for the Wilkins-Hearst Antarctic Expedition. See POLAR RESEARCH.

DEFECTIVES, SCHOOLS FOR. See EDUCATION.

DELANY, HENRY BEARD. American churchman and suffragan bishop of North Carolina in the Protestant Episcopal Church, died at Raleigh, N. C., April 14. He was born at St. Mary's, Ga., of negro parents, and was a grown man and successful at his trade of stonemason at Fernandina, Fla., when he entered as a student at St. Augustine's School, Raleigh. On his graduation in 1885 he became a teacher at the school, and he advanced to become, in time, its vice principal. He was ordained a deacon in the Protestant Episcopal Church in 1889 and a priest in 1892. In 1908 he was appointed archdeacon of colored work in the diocese of North Carolina, and in 1918 he was elected suffragan bishop for colored work, the dioceses of South Carolina and North Carolina agreeing to coöperate in his support. In 1911 he received the degree of D.D. from Shaw University.

DELAWARE. POPULATION. According to the 14th Census, the population of the State on Jan. 1, 1920, was 223,003. The estimated population on July 1, 1928, was 244,000. The capital is Dover.

AGRICULTURE. The following table gives the acreage, production, and value of the principal crops in 1927 and 1928:

Crop	Year	Acreage	Prod. bu.	Value
Corn	1928	136,000	4,448,000	\$3,949,000
	1927	135,000	4,725,000	3,780,000
Wheat	1928	102,000	1,836,000	2,295,000
	1927	98,000	1,862,000	2,328,000
Hay	1928	83,000	141,000 ^a	2,281,000
	1927	83,000	147,000 ^a	2,373,000
Potatoes	1928	7,000	658,000	494,000
	1927	6,000	714,000	571,000
Sweet potatoes	1928	7,000	980,000	784,000
	1927	8,000	880,000	616,000

^a tons.

MINERAL PRODUCTION. Both the aggregate value of clay products, the leading classification in the State's mineral industry, and that of stone, declined for 1926, as compared with 1925. Clay products totaled \$156,897 in 1926; in 1925, \$271,701. Production of stone was \$157,637 in value in 1926; in 1925, \$219,054. The total mineral production of the State was \$375,945 in 1926; in 1925, \$539,261.

FINANCE. Expenditures in the year ending June 30, 1927, as reported by the U. S. Department of Commerce, were: for maintenance and operation of State governmental departments, \$4,618,650 (of which \$1,403,371 was for local education); for interest payments on debt, \$448,601; for permanent improvements, \$2,085,545; total, \$7,152,796 (of which \$1,956,444 was for highways, \$227,219 being for maintenance and \$1,729,225 for construction). Revenues were \$7,786,110. Property and special taxes formed 61.4 per cent of the total; departments' earnings and remuneration for services rendered by officials, 4.9; sales of licenses and a sale tax on gasoline, 21.2. Property assessed valuation was \$256,906,080; State taxation thereon, \$642,265. Net State funded debt was \$8,878,372. The chief part of the debt was for highways.

TRANSPORTATION. The total number of miles of railroad line under operation on Jan. 1, 1928, was 331.79. No additional trackage was reported as built in the course of 1928.

EDUCATION. There was put into effect in 1928 a building programme based on a State appropriation of \$2,000,000, of which the object was to enable the school districts to conform to a desirable standard in regard to buildings. For the year 1927-28 the enrollment in the public schools of the State was 40,801. Of this number 34,450 were enrolled in the elementary schools and 6351 in the high schools. Expenditure for public school education in the State in 1927-28 totaled \$3,168,855.32. Salaries of teachers averaged \$1187 a year.

CHARITIES AND CORRECTIONS. The general welfare activities of the State in 1928 were under two bodies—the State Board of Charities and the State Health and Welfare Commission. There was also a Mothers' Pension Commission, charged with specific duties in regard to the mothers' pension system. Under control in each case of a separate board were the following institutions: Delaware State Hospital (insane), Farnhurst; Delaware Industrial School for Girls, Claymont; Industrial School for Colored Girls of Delaware, Marshallton; Ferris Industrial School, near Marshallton; New Castle County Farm for Women; Retention Home for Juveniles. There were also commissions for the blind and the feeble-minded. The Delaware Colony for Mental Defectives had,

Jan. 1, 1928, 115 inmates; the Delaware State Hospital, 579 patients (mental).

POLITICAL AND OTHER EVENTS. The new State permanent registration law went into operation in July, at the time of registration for the primaries and general election. It provided that the registrar must by August 22, give warning to all who had previously registered, but had failed to vote at the last general election, that such persons must reënroll; the law, however, failed to provide funds for the rendering of this notice. A survey was undertaken at the choked inlet of the Indian River, on the coast of Sussex County, to determine the possibility of reopening the inlet by the expenditure of a \$40,000 appropriation provided by the State Legislature. One of the oldest of the remaining historic buildings of Wilmington, the First Presbyterian Church, standing on a site acquired in 1740, was sold for commercial purposes at a reported price of \$750,000. The Regional Planning Federation, a body concerned with common interests of adjoining areas in Pennsylvania, Delaware, and Maryland, recommended the development of a system of by-pass highways to carry through highway traffic in these areas without overrunning the larger cities.

ELECTION. The popular vote for President at the election of November 6 gave Hoover (Rep.), 68,680 and Smith (Dem.), 36,643. John G. Townsend, Republican, was elected senator for the ensuing regular term, defeating Senator Thomas F. Bayard, Democrat, the incumbent, who ran for reelection. Senator Bayard gained a larger vote than the Democratic Presidential nominee, but was nevertheless severely defeated. Robert G. Houston, Republican, was elected United States Representative. C. Douglass Buck, Republican, was elected governor. The Republican candidates for the other State offices were likewise victorious. Henry Hazel was elected lieutenant-governor; Howard M. Ward, treasurer; Edward Baker, auditor; Reuben Satterthwaite, Jr., attorney-general.

OFFICERS (1928): Governor, R. P. Robinson; Lieutenant-Governor, J. H. Anderson; Secretary of State, S. D. Townsend; Treasurer, Howard M. Ward; Auditor, Edward Baker; Attorney-General, C. A. Southerland; Commissioner of Insurance, James G. Shaw; State Bank Commissioner, Harold W. Horsey.

JUDICIARY. Chancellor, Josiah O. Wolcott; Chief Justice, James Pennewill; Associate Judges, Richard S. Rodney (at large), Herbert L. Rice, William Watson Harrington, Charles S. Richards.

DE LIMA, ELIAS. American banker, died in Mexico, November 22. He was born at Curaçao, Dutch West Indies, in 1863, and was educated in Germany. Moving to New York, he was employed by the exporters, D. A. De Lima & Company, in 1882, being made a member of the firm six years later. He became a director of the Empire Trust Company, and of the New York Board of Trade and Transportation, and in 1908 he was chosen president of the Hungarian-American Bank. He went to Mexico City in 1910, as the representative of American bankers, and interested himself in various Mexican affairs, becoming president of the Banco de Comercio y Industria. During the insurrection against President Francisco Madero, in 1913, Mr. De Lima supported the Government. After Plutarco Elias Calles was elected President in July, 1924, he ap-

joined the banker his financial adviser, and requested him to establish in Mexico a federal reserve system modeled on that of the United States. Mr. De Lima retained his position as adviser to the administration until his death, having represented Mexico in several questions of international finance. He was made a director of the National Railroad.

DEL RIO, J MORA Y. See **MORA Y DEL RIO, J.**

DE MOLAY, ORDER OF. A non-sectarian secret organization for young men between the ages of 16 and 21; founded in March, 1919, by Frank S. Land, at Kansas City, Mo., and named in honor of Jacques De Molay, the last military Grand Master of the Knights Templar. The members are pledged to the precepts of love of parents, reverence, patriotism, cleanliness, courtesy, comradeship, fidelity, and to the promotion of the public school system. The Order is governed by a Grand Council of Freemasons, while the chapters are sponsored by Masonic bodies. In November, 1927, there were 1632 chapters, 250,000 members, and more than 100,000 De Molays who had outgrown active membership. The headquarters of the Order are in its own building, The Shrine of Youth, at 201 E. Armour Boulevard, Kansas City, Mo. Frank S. Land, the founder, was Grand Sorcerer of the Order in 1928.

DENGUE, Den'gá. This disease which again came into prominence in connection with the epidemic in Greece, visited the United States as recently as 1922, when it attacked chiefly the region between Alabama and Texas inclusive, the city of Galveston alone having 30,000 victims. It has often been confused with other epidemics, notably with mild influenza with which it has many points in common, such as attacking a large number of people simultaneously, and having hardly any mortality. Severe pains in the muscles are common to both and in both the course is relatively brief. Dengue, of course, bears no resemblance to the virulent type of influenza. The chief dissimilarity is in the mode of transmission, for while influenza spreads by direct contact, dengue is mosquito-borne. Certain resemblances in the epidemicity of the two diseases once led to the belief that dengue is a mild form of yellow fever. The disease occasionally appears in more northerly regions during the mosquito season.

THE EPIDEMIC IN GREECE. The first expert account of the epidemic of dengue in Greece was supplied to the *Deutsche medizinische Wochenschrift* (Sept. 28, 1928) by Dr. Moutoussis of Athens. The earliest cases were reported in September, 1927, and it continued to diffuse itself until December. There were several thousand victims during this period. The infection was traced to a family who had moved to Athens from Alexandria. The disease reappeared about Easter and as before continued to diffuse itself slowly. By the end of August hardly a household in Athens had escaped and over half a million cases had developed in the country at large. The clinical picture presented was very polymorphous, and there was a notable tendency to hemorrhages. Although most cases were mild there were many which were severe and the patients were often left with serious nervous symptoms. It is difficult to speak of the mortality for the victims may have been either of advanced age or afflicted with chronic disease. Some alleged fatalities were really due to tropical malaria,

paratyphus, etc. The author, who is a bacteriologist, finally was able to show that the disease is mosquito-borne and transmitted entirely by the species *Stegomyia fasciata*. The author inoculated himself and some volunteers by allowing themselves to be bitten by infected mosquitoes.

DENISON UNIVERSITY. A coeducational Baptist institution of higher education at Granville, Ohio; founded in 1831. The enrollment for the autumn of 1928 was 889, and for the summer session of 1928 it was 160. The faculty in the autumn of 1928 numbered 61, of whom 46 were men and 15 women, and of the total, 9 men and 1 woman were new additions since 1927. Miss Priscilla Fowle, Ph.D., was also added to the staff of the University as Dean of Women in 1928. The productive funds of the institution amounted to \$3,200,000 and the net income to \$239,000. The library was increased from 60,000 to 70,000 volumes during the year. The Whistler Memorial Hospital was ready for occupancy at the end of the year, and among the outstanding changes in the curriculum was the discontinuance of the Military Science Department, following upon the withdrawal of the Reserve Officers Training Corps.

DENMARK. The smallest of the three Scandinavian states; comprising the peninsula of Jutland with its adjacent islands in the Baltic, the Faroe Islands, a part of Schleswig as a result of the plebiscite of 1920 under the terms of the Treaty of Versailles, and Greenland, the only colony or possession. Iceland is a free sovereign State, but united to Denmark in the person of the King of Denmark who is also head of the Government of Iceland. Capital, Copenhagen. See **GREENLAND**; **ICELAND**.

AREA AND POPULATION. The area is 16,568 square miles, including the Faroe Islands, which have an area of 540 square miles; population, according to the census of Nov. 5, 1925, 3,434,555. North Schleswig, which voted in the plebiscite of 1920 to form a part of Denmark, had an area of 1502 square miles and a population in 1925 of 176,433. The islands in the Baltic had an area of 5133 square miles and a population of 1,575,533 in 1925. Of the population more than 95 per cent were born in Denmark. The movement of population in 1926 was: Births, 70,734; deaths, 38,093; marriages, 25,733; emigrants (chiefly to the United States and Canada), 5804. The population of Copenhagen in 1925 was 587,150; with suburbs, 731,496. Other large cities with their 1925 populations are Aarhus, 76,226; Odense, 52,376; Aalborg, 42,812; Horsens, 28,135; and Randers, 26,856.

EDUCATION. Primary instruction is free and compulsory between the ages of seven and 14. In 1926 there were 4493 lower schools; of these 34 were maintained by the National Government, 3852 by the local communes, and 607 were private institutions. The number of pupils in the 4493 schools on Jan. 1, 1926, was 493,237. For higher education there is the University of Copenhagen, founded in 1479, with about 120 professors and 4400 students. There are also many popular high schools, agricultural schools, training schools for teachers, and other technical special institutions.

PRODUCTION. The Danish Government fosters dividing the land into small farm parcels and is opposed to the union of small estates into large holdings. The result is that the land of the coun-

try is greatly subdivided. Of the total area, 80 per cent is productive; about one-sixth of the unproductive area is peat bog. According to the census of July 15, 1927, the extent of the cultivated area in Denmark was as follows: grain areas, 3,198,000 acres; root crop, 1,225,000 acres; other crop, 76,000 acres; green fodder and grass, 2,132,000 acres; fallow land, 207,000 acres; total cultivated area, 6,838,000 acres. The acreage and production of the principal crops in 1926 were as follows: Wheat, 251,554 acres, 238,593 tons; rye, 514,227 acres, 317,015 tons; barley, 770,476 acres, 727,534 tons; oats, 1,047,729 acres, 875,733 tons; mixed grain, 584,652 acres, 488,366 tons; potatoes, 189,283 acres, 811,700 tons. On July 15, 1927, there were in the country 523,785 horses, 2,911,949 head of cattle, 3,728,623 swine, and 18,524,000 hens.

There were according to the latest available statistics 89,175 industrial factories and shops, employing altogether 392,000 persons, of whom 270,000 were actual laborers. Of the total establishments, 26,300 used mechanical power. Danish industrial-production statistics for 1927, published late in 1928 by the Danish statistical department, showed considerable variation in the production of several industries as compared with 1926. In general, however, it was estimated that the production per worker continued to increase slightly. The great diversion, from an increase of 70 per cent to a decrease of 25 per cent for individual branches of industry, was accompanied by corresponding increase and decline in employment of workers. Marked increases in output were shown by the following branches of industry (percentage increase in parentheses): Slaughterhouses (33); cotton mills (20); cable manufacturers (25); and match factories (70). The largest decrease was shown in the manufacture of pianos, production of which dropped 25 per cent. Other industries showing a decline of 10 to 15 per cent were tanneries, glass factories, bicycle factories, and automobile plants. A large number of industries revealed practically no change.

COMMERCE. Denmark's foreign commerce in 1927 showed a slight gain both in respect to imports and exports over that of 1926. The total imports in 1927 were valued at 1,658,008,000 crowns and the total exports at 1,549,048,000 crowns. No later statistics as to details of the foreign trade were available than those given in the preceding YEAR BOOK where an analysis of the 1926 trade will be found.

FINANCE. The deficits that had characterized Danish budgets since 1920 were caused almost entirely by a large excess of expenditures over revenue on capital account. In only one of these years, 1923-24, was there a deficit in the current (ordinary) budget. The deficit on the total budget has decreased steadily, from a figure amounting in 1920-21 to almost 14 per cent of the total expenditures, to less than 1 per cent in 1925-26 and 2 per cent in 1926-27. The Danish budget is prepared on the "net" system; that is, total receipts and expenditures of government enterprises are not shown, only the deficits or surpluses from operation appearing in the budget. Furthermore, since the fiscal year 1925-26, the capital value of government-owned enterprises has been charged at an interest rate of 5 per cent while the book value of State property has been charged 1 per cent for depreciation. Surpluses

or deficits on these accounts in the budget, therefore, are inclusive of such charges.

The budget proposal for 1928-29, with expenditures at 413,800,000 crowns and revenues at 393,600,000, anticipated a deficit of 20,200,000 crowns. Current expenditure, at 332,042,232 crowns, was slightly above estimates for 1926-27 because of a "surplus" of 15,600,000 crowns, although appropriations for the various ministries were generally smaller. Capital expenditure, at 81,800,000 crowns, was considerably reduced. Current revenue, estimated at the same figure as for 1927-28, balanced current expenditure. The budget deficit was therefore caused by a large reduction in capital revenue, which item was estimated to total 61,500,000 crowns. The accompanying table is an abstract of the budget estimates for 1928-29 for current (ordinary) revenue and expenditure:

<i>Current revenue</i>		<i>Kroner</i>
Debit balance of domain revenues	1,590,273	
Debit balance of State undertakings	24,088,304	
Interest (net)	10,425,792	
Balance of funds, etc.	687,809	
Direct and indirect taxes	341,440,044	
Balance of lotteries	2,543,527	
Separate revenues	2,673,637	
Total current revenue	332,042,232	
<i>Current expenditure</i>		<i>Kroner</i>
Civil list and appanages	1,072,000	
Rigsdag	2,150,000	
Council of State	468,157	
Ministry of Foreign Affairs	4,724,697	
Ministry of Ecclesiastical Affairs	2,870,864	
Ministry of Public Instruction	61,515,779	
Ministry of Justice	16,679,805	
Ministry of Interior	67,872,551	
Ministry of Health	41,862,627	
Ministry of Agriculture	11,295,627	
Ministry of War	35,841,478	
Ministry of Marine	22,182,283	
Ministry of Finance	22,844,437	
Ministry of Industry, Commerce, and Navigation	4,690,688	
Greenland	12,329,048	
Pensions	12,329,048	
Total current expenditure	316,430,197	

COMMUNICATIONS. On Dec. 31, 1926, the Danish merchant marine (exclusive of colonies) possessed 1870 vessels of 1,108,300 registered tons gross. In 1926, 33,073 vessels of 10,431,000 tons entered the Danish ports from foreign countries and 34,649 vessels of 10,608,000 tons cleared. The total length of railways open to traffic was 3154 miles, of which 1519 belonged to the State. The total value of state railways up to Mar. 31, 1927, was 432,550,000 crowns.

GOVERNMENT. Executive power is vested in the King who acts through a responsible ministry, but who has no power to declare war or make peace without the consent of the Rigsdag, or Parliament, and the legislative power is vested in the Rigsdag, which is composed of the Folketing (lower house) and the Landsting (upper house). The Folketing has 149 members, of whom 117 are elected on the basis of proportional representation and the remainder divided among the parties not having obtained sufficient returns at the district elections; the Landsting has 75 members, elected indirectly by the voters for the lower house and the former Landsting. King in 1928, Christian X (born Sept. 26, 1870), who succeeded his father, Frederik VIII on May 14, 1912. The ministry, as appointed Dec. 14, 1926, was as follows: President of the Council and Minister of Agriculture, Th. Madsen Mygdal; Foreign Affairs,

L. J. Moltesen; Interior, Oluf C. Kragh; Health, V. Rubov; Justice, S. Rytter; Defense, S. Brorsen; Public Instruction, J. Byskov; Ecclesiastical Affairs, F. Braun-Rasmussen; Public Works, J. P. Stensballe; Finance, N. Neergaard; Industry, Commerce and Navigation, M. Slesbager.

HISTORY. Denmark enjoyed a quiet year. In the summer the Government determined to appoint a non-partisan commission to investigate conditions in Schleswig, which was turned over to her from Germany as a result of the plebiscite of 1920. In recent years the lot of the people of the district has not been very prosperous, chiefly because of economic conditions due to the continued depression in agriculture. There had been considerable talk of an economic union with Germany or the creation of an autonomous district. It appeared that the Danish Government was sincere in its desire to get at the root of conditions in the district. Attempts to organize a revolt in the province failed. The United States and Denmark signed a treaty of arbitration in June.

DENSITOMETERS. See PHOTOGRAPHY.

DENTON, OLIVER. An American pianist, died in Paris, July 19. He was born in Hempstead, N. Y., March 6, 1886. After completing his musical education at the National Conservatory in New York, where he was a pupil of Safonov, he continued his pianistic studies in Paris, under Isidore Philipp, and in Berlin, under Paul Goldschmidt. He made his European debut with the Berlin Philharmonic Orchestra, Feb. 7, 1913, and his American debut in recital in New York in 1916. The greater part of his time he spent making extensive tours of Europe and the United States. In 1925 he joined the faculty of the Institute of Musical Art.

DENVER, UNIVERSITY OF. A coeducational institution of higher learning at Denver, Colo.; founded in 1864. The registration for the autumn term of 1928-29 totaled 2714, distributed as follows: College of liberal arts, including pharmacy and engineering, 1149; school of dentistry, 106; school of law, 83; City College, 553; school of commerce, 823; school of pharmacy, 46; school of engineering, 151; and summer school of 1928, 820. The faculty had 177 members in the autumn of 1928. The library contained more than 50,000 volumes. Chancellor, Frederick Maurice Hunter, A.M. Ed.D.

DEPAUW UNIVERSITY. A coeducational institution for higher learning at Greencastle, Indiana, under the auspices of the Methodist Episcopal Church; founded in 1837. For the autumn session of 1928 the enrollment was 1616, including 907 men and 709 women. Of this number 1445 were registered in the college of liberal arts and 171 in the school of music. In the summer session of 1928 there were 133 students. The college of liberal arts had a faculty of 91 and the school of music, 16. During the year, 20 new faculty members were appointed as follows: The president; a professor of zoölogy; a professor and two assistant professors of military science and tactics; an associate professor of education; an assistant professor of comparative literature; an assistant professor of psychology; and 12 instructors. The productive funds of the University were \$5,297,853, including \$2,124,573 assets of the Rector Scholarship Foundation. The income from productive funds amounted to \$279,755, of

which a total of \$121,477 was for scholarships only. Total current income for the year was \$626,018. Lucy Rowland Hall, a dormitory for women, and the gift of the late Edward Rector, founder of the Rector Scholarship Foundation, was dedicated at the inaugural ceremonies in 1928. G. Bromley Oxnam, D.D., was inaugurated president of DePauw University on Oct. 12, 1928, at ceremonies presided over by the Hon. Roy C. West, Secretary of Interior and president of the Board of Trustees of the University, and participated in by Bishop Edwin Holt Hughes of the Methodist Episcopal Church, a former president of DePauw. Dr. Oxnam chose as the subject of his inaugural address, "Education and the New Society."

DEPEW, CHAUNCEY MITCHELL. American lawyer, railroad president, politician, and orator, died at New York, April 5. He was born at Peekskill, N. Y., Apr. 23, 1834. He was graduated from Yale College in 1856, was admitted to the bar two years later, and soon took an active part in politics. He had practiced debating while in college, and he early evinced the oratorical gifts that made him one of the most prominent and popular speakers of America. He was a member of the Republican party almost from its birth. His first political office was that of member of the New York State Assembly, to which he was elected in 1861 and 1862. In the following year he was elected Secretary of State of New York, holding the office for two years. He resigned to resume his law practice. President Johnson appointed him minister to Japan, and the Senate confirmed the appointment, but Mr. Depew declined the office, preferring to accept an offer to become attorney for the New York & Harlem R. R. This was the beginning of his connection with the New York Central system, which lasted from Jan. 1, 1866, until his death.

His legal work for the railroad did not preclude political activity, however, and in 1872 he was the unsuccessful candidate for Lieutenant-Governor of New York on the Liberal Republican ticket. He was a delegate to every national Republican convention from 1860 to 1924, and a prominent figure at these quadrennial assemblages until advancing years compelled him to curtail his activities. He placed Benjamin Harrison in nomination in 1888 and Levi P. Morton in 1896; in the former year Mr. Depew himself received 99 votes for the Presidential nomination. President Harrison offered to him the portfolio of Secretary of State, but he declined it. In 1899 Mr. Depew was elected Senator from New York, and he was reelected in 1905, serving until 1911. He had declined the office in 1885, the year in which he became president of the New York Central.

In 1869 Mr. Depew became counsel for the New York Central R. R., and in 1882 he was elected second vice president of the road, when it absorbed all the Vanderbilt lines. Three years later he succeeded to the presidency, which he held until 1898, when he resigned to become chairman of the board of directors of the entire Vanderbilt system. This chairmanship he retained, despite his advanced years, until he died, and he attended to the duties daily, with few absences.

It was as an orator that Mr. Depew was known best to the public, and for several decades he was probably the foremost after-dinner

speaker in America. He was frequently called upon to deliver addresses on formal occasions, and was the principal speaker at the Washington Centennial celebration at New York in 1889, at the unveiling of the Statue of Liberty, in New York Harbor, and at the dedication of the World's Columbian Exposition, Chicago, 1893. He delivered orations at the memorial services for President Garfield and General William T. Sherman.

Mr. Depew was an active worker in the cause of good feeling between England and America and was prominent in the work of the Pilgrims and similar societies. Yale University conferred on him the honorary degree of LL.D. in 1887, and France made him an officer of the Legion of Honor. He published *Some Views on the Threshold of Fourscore* (1914) and *Speeches and Literary Contributions at Fourscore and Four* (1918).

DERBY. See RACING.

DE ROBECK, də rō'bĕk, SIR JOHN MITCHEL. British naval officer, died at London, January 20. He was born, of Swedish descent, at Naas, Ireland, June 10, 1862, and entering the Royal Navy as a cadet on H.M.S. *Britannia* in 1875, advanced through successive grades until in 1897 he was put in command of the destroyer, *Desperate*. In 1911 he was appointed rear-admiral, and the following year he received the newly created post of admiral of patrols. When Great Britain entered the World War, Admiral De Robeck was placed in command of the northern mid-Atlantic station and captured several German merchant steamers. From March, 1915 until January, 1916, he commanded the Allied naval forces on the Dardanelles Expedition, having succeeded Vice Admiral Carden during the early part of the campaign. After the fleets' withdrawal from the Straits, Admiral de Robeck in 1916 was given the command of the second battle squadron of the Grand Fleet, which he held until the end of the war. He then returned to the Mediterranean as commander-in-chief, and from 1922 until 1924 he commanded the Atlantic Fleet. Finally, in 1925, he was appointed admiral of the fleet. In recognition of his war-time services, Admiral de Robeck was decorated with the French Legion of Honor, the First Class Sacred Treasure of Japan, and the Grand Cross Order Crown of Italy. Great Britain created him a Knight Commander of the Bath in 1916, a baronet and a Knight of the Grand Cross of Saint Michael and Saint George in 1919, a Knight of the Grand Cross of the Bath in 1921, and a Knight of the Grand Cross of Royal Victorian Order in 1924.

DESTICKER, dēs tī kă', PIERRE-HENRI. French soldier died at Paris, November 26. He was born at Avesnes, Nord, Mar. 4, 1866, and attended the lycée de Douai, the École Bosquet, and the École Polytechnique. A major of artillery at the opening of the World War, he was detailed later to staff work. He was appointed to increasingly responsible positions, holding the rank of general by the end of the war. He served with Marshal Foch, when he was president of the allied military committee at Versailles. He also accompanied Marshal Foch on his visit to the United States in 1921. In 1924 he was made chief of staff. Desticker gave support to the Herriot government in 1924 in the maintenance of its liberal readjustment policy, when he announced that Marshal Foch

had never considered the Ruhr occupation necessary as a military defense. Desticker was commissioned lieutenant general in 1925. In the same year the League of Nations appointed him president of a commission to investigate German armaments.

DETROIT. See MICHIGAN.

DETROIT INSTITUTION OF ARTS. See ART EXHIBITIONS; ART MUSEUMS.

DETROIT, UNIVERSITY OF. An institution of higher education at Detroit, Mich., under the auspices of the Roman Catholic Church and conducted by the Jesuit Fathers; founded in 1877. In the autumn of 1928 there were 3044 students registered for the college courses, distributed as follows: Arts and Sciences, 528; engineering, 1060; commerce and finance, 958; law, 211. In addition, there were 332 students enrolled for the high-school course. In the summer session 197 students were enrolled. The faculty, not counting those in the high-school, numbered 181. The productive funds in 1928 totaled \$643,213.35. There were 50,000 volumes in the library. President, the Rev. John P. McNicholas, S.J., Ph.D., LL.D.

DEUTSCH, doich, FELIX. German industrialist, chairman of the board of the Allgemeine Elektrizitäts Gesellschaft, died at Berlin, May 19. He was born at Breslau, Germany, May 16, 1858. He was closely associated for many years with the late Walter Rathenau, with whom he founded the German Edison Company. This expanded into the famous "A. E. G.," the General Electrical Company of Germany. When Rathenau was assassinated in 1922, Deutsch succeeded him as president. He had been trained in early life as an engineer. He was deputy chairman of the Central Association of the German Electro-Technical Industry, a privy commercial counselor and a member of the Business Council of Germany. Dr. Deutsch visited the United States in 1927 and delivered lectures on German industrial conditions and his observations in America.

DEVOY, də'voi, JOHN. Irish patriot, died at Atlantic City, N. J., September 29. He was born at Kill, County Kildare, Ireland, Sept. 3, 1842, and educated at Dublin. He was an active worker for Irish freedom, starting as a member of the Irish Republican Brotherhood when he was nineteen years old. He joined the French Legion, 1861, and after a year in Algeria, he returned to County Kildare, and became an active leader in the brotherhood at Naas. He was intrusted by the Fenians in October, 1865, to incite and organize Irishmen in the British Army, and he succeeded so well that in September of that year the English authorities issued a warrant for his arrest. He escaped to Dublin at first, but was captured in February, 1866, and a year later sentenced to fifteen years imprisonment, having pleaded guilty at his trial, in order to attempt an escape, which failed. Devoy served five years of his term and was then allowed to leave prison on the condition that he pass the remaining ten years of his sentence in the United States. He spent the first years of his exile working on New York and Chicago newspapers. Continuing his activity in behalf of Irish independence, he was one of the leaders in the arrangements for *The Catalpa*, which rescued Irish prisoners

from Australia, 1876. He also visited Ireland secretly, 1879, and he became editor of the Irish-American paper, *The Gaelic American*, published in New York, at its foundation in 1903. He visited the Irish Free State in 1924, and was honored for his many services.

DIABETES, dī'a-bē'tēz. *Diabetes in Childhood*. The *Journal of the American Medical Association* for June 9, 1928, contains two references to diabetes in childhood. The first is editorial comment on a paper by Boyd and Nelson of Iowa City on the growth of diabetic children who had been profiting in a manner almost miraculous from the insulin treatment. In a group carefully studied over sufficient intervals, these children were found to grow normally both as to height and weight. There is even a superiority in this respect over normal children, due naturally to the great care exercised which includes the most careful feeding. Of course the ultimate fate of these children cannot be known, but the gain was great, for left to themselves these subjects could not thrive like normal children.

The second reference to diabetic children is an original article by Boyd (already mentioned) and Drain on the arrest of dental caries in childhood. It was noted that certain children to be discussed later, appeared to have undergone a spontaneous arrest of caries. There were 28 of these children and, after having received the report of the dentists, the authors were surprised to find that members of the group were all diabetics who had been for months under a special regimen of insulin and a diet rich in mineral salts and vitamin. In other words despite diabetes it is possible to render these children superior in certain respects to the average by purely artificial resources. See also **FOOD AND NUTRITION**.

DIAMONDS. An outstanding feature of the diamond industry was the controlling forces which had been employed to stabilize it for more than a quarter of a century. During the War, operations were shut down for a year and in the two years of post-war depression there was a curtailment of operations. This policy was employed again in 1928 to remedy conditions of overproduction, which resulted from the enormous output which had occurred in the Lichtenberg district of South Africa. Within a period of six months diamonds valued at more than £4,000,000 were taken from the alluvial fields near the mouth of the Nolloth River, in Namaqualand, and were held by the Union of South Africa Government and were to be disposed of as the market would absorb them, the proceeds to be used in road building and other public improvements. Rigid supervision of prospecting in the future by the Government would make impossible the diamond rushes which had occurred, as well as protect those who had purchased diamonds and held them as a portable and liquid form of wealth. Another restriction placed on the industry was the establishment of a limited diamond-cutting industry at Kimberley.

Diamond sales by De Beers Consolidated for the year ended June 30, 1928, were reported as £3,311,780, as compared with £4,313,674 for the preceding year; net profit was £2,989,874, and dividends paid totaled £1,345,257. Production in Tanganyika decreased slightly. The diamonds produced during the year were of a high quality, exceptional stones valued at \$50,000, \$75,000,

and even \$100,000 each having been produced. The demand was also active. It was reported that only a small part of the diamonds were cut in brilliant form, but that many were emerald cut, or square, while many of the smaller ones were cut in a form known as baguette, which has a back with a brilliant cut, and is therefore heavier. Although a number of larger mines in Africa and elsewhere had been using airplanes to transport diamonds from the mines for some time, transportation of precious stones and jewels between the East and West by air-mail was an innovation of the year in the United States.

The value of diamonds imported into the United States during 1928 was as follows: rough and uncut, 291,302 carats valued at \$11,935,191, as compared with 237,095 carats valued at \$11,470,026 in 1927; diamonds cut but not set, 440,437 carats valued at \$42,396,162, as compared with 445,571 carats valued at \$40,736,351. The largest sources of the cut diamonds were, the Netherlands with 216,018 carats valued at \$21,552,171, and Belgium, with 189,243 carats valued at \$15,529,373.

DIAZ, ARMANDO. Italian soldier, died at Rome, February 29. He was born at Naples in 1861, and was educated at the military schools in Naples and Turin. He served in the Abyssinian campaign, 1895-96, in the Libyan campaign, 1911, and in the war with Turkey, 1911-12. At the outbreak of the World War he was director of military operations on the staff of General Cadorna. He commanded a division on the Carso front after the entrance of Italy into the War, and was promoted to the command of the Twenty-third Army Corps, which penetrated the Selo line on the middle Carso in August, 1917. After the disaster of the Caporetto, when the German and Austrian troops penetrated the Italian line and forced the army to retreat from the Isonzo River to the Piave, Diaz was appointed commander-in-chief to succeed General Cadorna. He made a brilliant defense, and established his reputation as one of the greatest generals of the War. By the end of June, 1918, he had forced back the enemy east of the Piave, and on Oct. 27, 1918, he attacked across that river and was successful all along the line. A week later Austria surrendered. For his services Diaz received the Collar of Annunziata, the highest Italian order, and honors were accorded him by France, England, Belgium, and the United States. He visited the last named country in 1921. In December of that year King Victor Emmanuel created him Duca della Vittoria, and in November, 1924, he and Cadorna were made Marshals of Italy, a new rank. On the advent of the Fascist Government in Italy, Diaz was appointed minister of war, but he was compelled to resign, owing to ill health, in 1924.

DIAZ DE MENDOZA, MARIA GUERRERO DE. See GUERRERO DE DIAZ DE MENDOZA, SEÑORA MARIA.

DICKEY, JAMES EDWARD. American clergyman, bishop of the Methodist Episcopal Church South, died at Louisville, Ky., April 17. He was born at Jeffersonville, Ga., May 11, 1864, and was graduated from Emory College in 1891. He taught at Emory, from 1891 to 1899, successively as adjunct professor of mental and moral science and professor of history and economics. From 1899 to 1902 he was pastor of

Grace Church, Atlanta, Ga., and from 1902 to 1915 president of Emory College. He was pastor of the First Church, Atlanta, 1915-20; secretary of education, North Georgia Conference, in 1921; pastor of the First Church, Griffin, Ga., in 1922, and bishop of the Methodist Episcopal Church South from May, 1922. Kentucky Wesleyan University conferred on him the degree of D.D. in 1903 and Emory University that of LL.D.

DICKINSON, JACOB MCGAVOCK. American lawyer, and secretary of war in President Taft's cabinet, died at Chicago, Ill., December 13. Born at Columbus, Miss., Jan. 30, 1851, he served for a time in the Confederate Army. He was graduated from the University of Nashville in 1871, and after receiving the A.M. degree the following year, studied law at Columbia, the University of Leipzig, the École de Droit, and the Sorbonne. Admitted to the bar in 1874, he practiced at Nashville until 1899, being especially commissioned several times to preside in the supreme court of Tennessee, and serving as assistant attorney-general of the United States, 1895-97. Mr. Dickinson practiced in Chicago, 1899-1909, and during that time was counsel for the United States before the Alaskan Boundary Tribunal, 1903, general solicitor for the Illinois Central Railroad, 1899-1901, and general counsel, 1901-09. Although a Democrat, he supported William H. Taft against William Jennings Bryan in the presidential campaign of 1908, and on Mar. 4, 1909, became secretary of war. He resigned, in May, 1911, and returning to his law practice in Chicago, he became receiver for the Rock Island Lines, 1915-17. He was awarded the LL.D. degree by Columbia and the University of Illinois, 1905, by Yale, 1909, and by Lincoln University, 1917. Besides being at one time vice president of the American Society of International Law, Mr. Dickinson was president of the American Bar Association, 1907-08.

DICKSEE, dik'sē, SIR FRANCIS BERNARD. English painter and president of the Royal Academy, died at his birthplace, London, October 17. He was born Nov. 27, 1853, and after attending the Rev. Mr. G. Henslow's School, he joined the painting classes of the Royal Academy at the age of sixteen. Being especially interested in illustration, he started his career by drawing for magazines and books. He also studied under Henry Holiday, developing his preference for descriptive pictures. He first exhibited at the Academy in 1876, and the following year his "Harmony" was selected as the picture of the year, and purchased with the Chantrey bequest. Dicksee was made an associate member of the Royal Academy in 1881 and became a full member ten years later; he was elected president in December 1924. He was contemptuous of the "ugliness" in the modernist school of painting, and, aside from his portraits, notably his "A Woman in White," 1928, he gained his popularity with romantic representations. Among his best known pictures are "The Ideal" and "The Two Crowns," which hang in the Tate Gallery, London, and "The Symbol," "The Crisis," "The House Builders," and "A Reverie," in the Walker Art Gallery, Liverpool. Other important scattered pictures are, "Romeo and Juliet," "The Love Story," "The Passing of Arthur," "Daughters of Eve," "La Belle Dame Sans Merci," "One of Our Conquerors," "The Confession," "Paola and Francesca," "The Redemption of Tannhäuser,"

"The Funeral of a Viking," "The Shadowed Face," and "The Light Incarnate." Sir Francis was knighted in 1925, awarded the D.C.L. degree by Oxford in 1926, and created a Knight Commander of the Royal Victorian Order in 1927.

DIETETICS. DIETARY STUDIES. See FOOD AND NUTRITION.

DIPHTHE'RIA. Dr. D. B. Armstrong, assistant secretary of the Metropolitan Life Insurance Co. supplied some statistics on this affection to the daily press (*New York World*, Sept. 17, 1928,) which had been assembled by boards of health and by his company, and which bear especially on the relation of immunizing campaigns to the death rate. During the two years, 1927-28, there had been an increase in the latter which was much more marked in large metropolitan areas than in suburban and rural districts. Thus in New York City the increase in 1927 as compared with 1926 was about 50 per cent, but in New York State, the upstate regions showed an increase of but 6 per cent. This difference appears to be due wholly to the fact that in the latter area immunization was carried out much more thoroughly than in the congested metropolitan areas where there is marked indifference to this preventive resource. Still more striking were some figures from Illinois, where 44 counties did not report a single death from the disease during 1927 and there was a decline in the annual rate of 6 per cent; while in Cook Co. the deaths increased by nearly 100 per cent over 1926. It was in this favored region of the State that immunization had been carried out intensively. Good results also were traced to immunization in Michigan. In 1927 four cities—New York, Chicago, Pittsburgh, and Montreal—accounted for 88 per cent of the total mortality and it was regrettable that these cities had slighted immunization.

DISCIPLES OF CHRIST. A communion known also as the Churches of Christ and sprung from a movement for Christian unity, which arose in American Presbyterian circles at the beginning of the nineteenth century, under Barton W. Stone, in Kentucky, and Thomas and Alexander Campbell in Western Pennsylvania. This is the largest religious body having its origin in America. It was fifth among Protestant communions in the United States in 1928. In polity the churches are congregational. There were six major agencies of the communion in 1928: The United Christian Missionary Society; Board of Education; Board of Temperance and Social Welfare; Association for the Promotion of Christian Unity; Pension Board; and the missionary societies of the several states and provinces of Canada. These agencies are related in an advisory way to the International Convention of Disciples of Christ which meets annually in the late summer or early autumn. The general missionary work of the churches is organized under the United Christian Missionary Society, with headquarters at 222 Downey Avenue, Indianapolis, Indiana. Its board of managers of 120 is

composed of an equal number of men and women. The foreign missionary work in 1928 embraced the Belgian Congo, Africa, China, India, Jamaica, Japan, Mexico, Philippine Islands, Porto Rico, Argentina, Paraguay, and Tibet.

During 1928, the survey volume, *Survey of Service*, was published, covering six years of effort and including an investigation and study of every phase of organizational effort in the brotherhood. It is the most significant phase of self-examination and self-criticism ever undertaken and passes in extent and objective anything so far projected by any communion.

Statistics of the denomination show that during the year there were 5800 baptisms in the foreign fields, a gain of 416 over the previous year. The 512 mission schools had a total enrollment of 15,621. The communion maintained 15 hospitals and 21 dispensaries which treated 349,577. The church erection fund amounted to \$2,607,976, and appropriations for pastoral support were made to churches in 32 States and 6 Canadian provinces. The Society maintained Bible chairs in four State universities; and forty-five young people's conferences were held, a gain of eleven over the previous year. Work was conducted among the French, Highlanders, immigrants, Negroes, Orientals, Spanish-Americans, and Mexicans. The department of benevolence maintained 6 homes for children, an equal number of homes for the aged, and one hospital. In 1928, 25 colleges coöperated with the Board of Education. The total church membership throughout the world in 1928 was 1,629,383, a gain over 1927 of 56,120, and in the United States and Canada, 1,538,365, a gain of 56,989. Bible school enrollment for the world was 1,204,910, a gain of 6302, and for the United States and Canada, 1,131,586, a gain of 15,067. Contributions for the fiscal year in the United States and Canada totaled \$4,063,937. Among the periodicals published by the communion are *World Call*, *Christian Evangelist*, and *Christian Unity Quarterly*. The president of the International Convention for the year was Harry H. Rogers of Tulsa, Okla. Dr. F. W. Burnham of Indianapolis, Ind., was president of the United Christian Missionary Society.

DITRICHSTEIN, LEO. Austro-American actor and playwright, died at Auersperg, Austria, June 28. He was born at Temesvar, Hungary, Jan. 6. 1868. He was educated at Vienna and made his first stage appearance with a light opera company in Hungary. He was trained in German dramatics in Berlin. His American début was made in New York in 1890, in a German play, *Die Ehre*. He soon acquired sufficient English to appear acceptably on the American stage, and he was naturalized as an American citizen in 1897. He played in *Mr. Wilkinson's Widows*, *Trilby*, *Are You a Mason?* *Hedda Gabler*, *Doctor Claudius*, *The Concert*, and other plays that were successful and established him in public favor as a portrayer of comedy and romantic rôles. His greatest hit was made in his own play, *The Great Lover* (1915) written in collaboration with Frederick and Fanny Hatton. Among the other plays written by Ditrichstein were: *Gossip* (with Clyde Fitch, 1895); *A Southern Romance* (1897); *The Last Appeal* (1901); *What's the Matter With Susan?* (1904); *The Ambitious Mrs. Su-*

san (1907); *The Million* (from the French, 1911); *The Concert* (1911); *Temperamental Journey* (1912).

DIVORCE. See MARRIAGE AND DIVORCE.

DIX, JOHN ALDEN. Former Governor of the State of New York, died at New York City, April 9. He was born at Glens Falls, N. Y., Dec. 25, 1860. He was graduated from Cornell University in 1883 and, entering business, became, eventually, president of the Iroquois Paper Company, treasurer of the American Wood Board Company, vice president of the Blandy Paper Company and manager of the Moose River Lumber Company; he was also vice president of the First National Bank of Albany, N. Y. In 1904 he was a delegate to the Democratic national convention, in 1908 Democratic nominee for lieutenant-governor and chairman of the Washington County Democratic Committee, and in 1910 chairman of the Democratic State Committee. He was elected governor for one term, 1910-12. After his retirement from office Mr. Dix took no active part in politics. Hamilton College conferred on him the degree of LL.D. in 1912.

DOMINICA. See LEEWARD ISLANDS.

DOMINICAN REPUBLIC (SANTO DOMINGO). A West Indian state occupying the eastern part of the island of Haiti, or Santo Domingo, the smaller part being occupied by the Republic of Haiti. Capital, Santo Domingo. See HAITI.

AREA AND POPULATION. The estimated area is 19,332 square miles; population, according to the census of 1921, 897,405. The largest cities with their populations at that census were: Santo Domingo, 30,957; Santiago de Los Caballeros, 17,502; San Pedro de Macoris, 13,802; and La Vega, 6564. An American estimate placed the population at 1,022,485 at the beginning of 1928.

PRODUCTION. The Dominican Republic is essentially an agricultural country deriving its income almost entirely from the cultivation of the soil. Although sugar is the major crop, contributing 62 per cent of the total exports in the past five years, the yield from other crops, cacao, tobacco, and coffee, is important in gauging the trend of economic conditions. These secondary crops are raised by numerous small farmers and the money realized from their sale means a direct contribution to purchasing power. Raw sugar production, on the other hand, is largely controlled by outside capital and the money obtained from the crop does not flow directly back into circulation through such wide diffusion of receipts, although individual cane growers do benefit, of course, from that portion of the crop not grown by the centrals, and there is a further direct contribution in the form of wages and transportation costs. This condition explains the apparent inconsistency of a period of unusual prosperity coincident with a depression in the market for the major crop, as was the case in 1927, when sugar prices were close to the cost of production. The prosperity existing in 1927 was primarily the result of large crops of tobacco and cacao with favorable prices. The cacao production in 1927 was 26,000,000 kilos and the tobacco production 35,000,000 pounds. In the same year 652,332,000 pounds of raw sugar kind are found in the Republic but are not exported. Mineral resources of almost every plotted to a large degree of commercial success.

COMMERCE. Raw sugar is the principal commodity exported from the Dominican Republic and in 1927 comprised 53 per cent of the total shipments. The other leading products shipped, in order of their importance, were cacao, leaf tobacco, and coffee. The principal countries of destination for exports from the country are the United States, Canada, Ireland, England, the Netherlands, Germany, and France. The United States is the largest consumer of Dominican products, having taken 28 per cent of the total exports for 1927.

The imports consist mainly of manufactured goods. There is relatively little industry in the country. The principal articles imported, in the order of their importance, are cotton manufactures, rice, jute bags, wheat flour, gasoline, machinery, automobiles, lard, silk goods, crude oils, chemicals and drugs, boots and shoes, paper manufactures, oils for table use, soap, lumber, salt fish, woolen manufactures, rubber manufactures, illuminating oils, and liquors and beverages. The chief source of Dominican imports is the United States, which furnished 64 per cent of the total in 1927, as compared with 60.7 per cent in 1926. Germany was next in importance, with 7.8 per cent in 1927, followed by British India, the Netherlands, France, Belgium, and Spain. As between the Dominican Republic and the United States, the balance of trade is uniformly in favor of the United States. This "favorable" balance has increased noticeably since 1922; as Dominican sugar no longer can compete successfully in the United States against the Cuban and Porto Rican product.

The foreign trade of the Republic for 1927 amounted to \$58,962,000, a figure which has only been exceeded in the history of the Republic in 1919 and 1920, when total trade amounted to \$61,620,000 and \$105,257,000, respectively. Total imports and exports amounted to \$27,784,000 and \$31,178,000 in 1927, as compared with \$23,678,000 and \$24,896,000, respectively in 1926. The trade balance in favor of the Republic amounted to \$3,394,455.

FINANCE. The following table from the Pan-American *Bulletin* shows the budget for 1928:

<i>Receipts</i>	
Internal revenue	\$4,893,000.00
Customs receipts	4,800,000.00
Charity lottery	2,822,400.00
Central Dominican Railway	300,000.00
Santiago-Puerto Plata water and light service	120,000.00
10 per-cent surcharge on patents for chambers of commerce	50,000.00
Tax on imports by tonnage, water-works fund, law No. 419	80,000.00
	<hr/> 12,565,400.00
<i>Expenditures</i>	
Legislative power	293,220.00
Executive power	277,220.00
Department of the Interior, Police, War, and Navy	1,572,694.40
Department of Foreign Affairs	399,645.85
Department of Finance and Commerce	1,027,790.00
Department of Justice and Public Instruction:	
Judicial section	733,557.88
Educational section	1,210,235.04
Department of Agriculture and Immigration	236,210.00
Department of Promotion and Communications	1,732,676.00
Department of Health and Charity ..	122,180.00
Special expenditures	4,517,400.00
	<hr/> 12,172,829.17

As may be seen from the foregoing, there is an estimated surplus of \$392,670.83 for 1928. The actual surplus for 1927 was \$962,080.46. The public debt on Dec. 31, 1927 was \$15,000,000. The gross collections of Dominican Customs Receivership in 1927 amounted to \$5,896,429, the largest for any year excepting 1920, when they reached \$6,273,741.

COMMUNICATIONS. In 1926, 1959 vessels of 2,357,444 tons entered the ports of the Republic and 1585 vessels of 1,959,901 tons cleared. There are two railway lines in the country, one owned by the Government about 60 miles long and a privately owned line about 80 miles long. In 1927 there were 557 miles of highway; in 1926 1034 miles of telegraph wire; in 1924, 2383 telephones in use; and in 1928 there were 3985 automobiles registered.

GOVERNMENT. The Republic is governed under a constitution adopted by the Constituent Assembly on June 13, 1924. Executive power is vested in a president and cabinet of seven ministers. The President is ineligible for a second successive term. The senators and deputies are elected for four years by direct popular vote. Each of the 12 provinces is represented by one senator and (in practice) by two deputies. President in 1928, Horacio Vazquez, who assumed office on July 12, 1924; vice president, Frederico Velazquez.

HISTORY. The Pan American *Bulletin* for September, 1928, reported an interesting commentary on the Columbus Lighthouse. "Architects all over the world have responded with great enthusiasm to the call to the competition for architectural plans for the Columbus Memorial Lighthouse to be erected in Santo Domingo, capital of the Dominican Republic. By the middle of August, 1928, the total number of architects registered in the Pan American Union was 1091, from 58 nations and territorial divisions. The handsome quartos containing the conditions for the competition were mailed to reach the competitors September 1. Beautiful examples of the bookmaker's art, these volumes, prepared by Mr. Albert Kelsey, technical adviser of the competition, contain a history of the project, a map showing the site, the programme of the preliminary competition, rules to govern both stages of the competition, and "Impressions of, and Observations by, an Architect after Having Visited the Dominican Republic."

DONN-BYRNE, BRIAN OSWALD. See BYRNE, DONN.

DONNELLY, DOROTHY AGNES. American actress and playwright, died at New York, January 3. She was born at New York, Jan. 28, 1880, and was educated at the Convent of the Sacred Heart, New York. She made her debut at the Murray Hill Theatre, New York, playing juvenile and leading rôles, and her first success was in the creation of the part of Candida in the George Bernard Shaw play of that name, in December, 1903. She also played Mme. Alvarez in Richard Harding Davis's *Soldiers of Fortune*. In 1905 she appeared in several of Ibsen's plays, and later took the part of Jacqueline in *Madame X*. Her last stage appearance was made in 1915; after that time she devoted herself to the writing of plays, in which she was successful. She was prominent in war work, especially overseas, as a member of the A. E. F. Entertainers. She wrote: *Blossom Time*, *Forbidden*, *Poppy*, and *The Student Prince*,

and was co-author of *Florabelle, Fancy Free, Johnny Get Your Gun*, and *The Riddle Woman*.

DOULCET, JEAN. French diplomat, died at Rome, February 12. He was born at Palaiseau, France, Aug. 5, 1865. He was educated at the Lycée Condorcet and was admitted to the bar. He studied also at the School for Political Sciences. M. Doulcet's first diplomatic post was that of Secretary of the French Embassy at London, from 1893 to 1897, and he served in the same capacity at Lisbon, 1907, and Madrid, 1911. From 1912 to 1918 he held the rank of minister plenipotentiary, and was attached to the French Embassy at St. Petersburg, his term of service there covering the period of the World War. He was minister to Norway in 1919, and he was in charge (1920-21) of the mission which reestablished diplomatic relations between France and the Holy See. Following the return of that mission he became minister to Hungary, in 1921. At the time of his death he was French Ambassador to the Holy See.

DRAINAGE. See RECLAMATION.

DRAKE UNIVERSITY. An institution for the higher education of men and women at Des Moines, Iowa, founded in 1881. The number enrolled in the autumn of 1928 was 1735, distributed as follows: College of liberal arts, 607; commerce, 267; education, 326; law, 77; fine arts, 358; and Bible, 93. The faculty numbered 90. The fixed endowment amounted to \$1,266,770. The number of volumes in the library was 51,024. President, Daniel W. Morehouse, Ph.D.

DRAMA. See THEATRE and articles on LITERATURE, ENGLISH AND AMERICAN; FRENCH LITERATURE; GERMAN LITERATURE; ETC.

DUKE UNIVERSITY. A coeducational institution for higher education at Durham, N. C.; established in 1924 by the expansion of Trinity College, made possible through benefactions from James B. Duke, as described in the article on the University in the 1925 YEAR BOOK. The enrollment for the autumn of 1928 was 1806, distributed as follows: Undergraduates, 1576; in graduate school of religion, 62; students in other graduate schools, 168. For the summer session of 1928 there was an enrollment of 1484. In the autumn of 1928 the faculty, including officers, numbered 235, and in addition, there were 39 teachers in the 1928 summer school who were not included on the regular staff of Duke University. The endowment funds of the University amounted to \$20,785,207, and the income for the year was \$864,723. Eleven new buildings, including a library, union hall for recreational and student activities, a chapel, five dormitories, a class-room building, a science building, and a faculty apartment house were occupied during the year; and work was progressing satisfactorily on a forty-five-hundred-acre tract of land, a mile from the campus, on which were to be located a group of forty or more buildings, built of native North Carolina stone of Cambrian formation, taken from a quarry owned by Duke University. The Duke University Medical School was to be the first university unit to occupy the new campus, in about September, 1930, followed as rapidly as possible by other units. Gifts received during the year 1927-28 amounted to \$15,290, and it was reported that the Angier B. Duke Memorial

Loan Fund for students exceeded \$500,000 in value in 1928. The University library contained 108,865 catalogued volumes. President, William Preston Few, Ph.D., LL.D.

DUNCAN, dŭn'kăn, JAMES. American labor leader and former vice president of the American Federation of Labor, died at Quincy, Mass., September 14. He was born in Kincardine County, Scotland, May 5, 1857, and educated at Aberdeen. Moving to the United States, he began work as a granite cutter in 1873, and he became secretary of the New York branch of the Granite Cutters' International Association in 1881, holding a corresponding position at the Baltimore branch three years later. In 1895 he became president of the association, after having been elected vice president of the American Federation of Labor in the previous year. He became first vice president in 1902, and in 1895 he was made editor of the *Granite Cutters' Journal*. In 1900 he led a successful strike for an eight-hour day in this industry. He represented the American Labor movement at the British Trades Congress at Bristol in 1898, and he was also a delegate of the American Federation of Labor at the International Secretariat Conference of Labor at Budapest in 1911. President Wilson appointed Mr. Duncan diplomatic envoy extraordinary to Russia in 1917, and he became a member of the American Labor Mission at the Paris Peace Conference in 1919.

DUNKERS or DUNKARDS. See BRETHREN, CHURCH OF THE.

DURANT PRIZE. See PROHIBITION.

DUTCH EAST INDIES. A possession of the Netherlands in the East Indies, comprising the territory of Dutch East India and consisting of the group of islands in the Pacific lying between 6° N and 11° S, and between 95° and 141° E longitude. Capital, Batavia.

AREA AND POPULATION. The usual method of dividing the colony is as follows: (1) Java and Madura, divided into 17 residencies, each under a resident and several assistants at the head of a large number of native officials; (2) the Outposts, consisting of Sumatra, Borneo, Celebes, a part of New Guinea, the Molucca Archipelago, the Sunda Islands and other small islands, under functionaries variously entitled governor, resident, controller, etc. The area is estimated at 733,642 square miles; population, according to the census of 1920, 49,350,834. In the same year the Europeans numbered 169,708, and the Orientals, other than native, 876,506, mostly Chinese and Arabs. The estimated population on Dec. 31, 1925 was 51,013,878.

PRODUCTION. Most of the land of the Dutch East Indies is claimed by the Government and a vast majority of the people are agricultural laborers. The harvested areas under various native crops in Java and Madura in 1926 were as follows, in acres: Irrigated rice, 7,287,448; non-irrigated rice, 1,102,853; maize, 4,347,355; cassava, 1,879,992; sweet potatoes, 420,244; groundnuts, 484,197; soya beans, 420,984; other pulses, 522,869; tobacco (native), 346,640; other secondary crops, 1,461,151; total, 18,573,733. The harvested area under sugar in the same year was 444,019 acres; the production, 1,972,771 tons; and the number of sugar factories, 178. The amounts of other products were: Coffee, 38,978 tons; rubber, 122,926,000 kilos; cinchona, 10,643,000 kilos; tobacco, 59,059,000 kilos; tea, 62,920,000 kilos; cacao, 775,000 kilos; and oil

palms, 9,507,000 kilos. The total yield of the tin mines, both those worked by the Government and by private capital in 1926 was 528,566 piculs (1 picul equals 133½ pounds). In the same year the yield of the principal coal mines in Java, Sumatra, and Borneo was 1,466,359 metric tons. While the greater part of the land of Java is claimed by the Government, private estates are found chiefly in the western part, and mainly in the hands of Europeans and Chinese.

COMMERCE. Foreign trade of the Dutch East Indies registered an increase of 18 per cent in imports and a decline of 10 per cent in exports. Merchandise imported for private account was valued at 865,304,000 florins (\$346,122,000), against 818,370,000 florins (\$327,348,000) the previous year, and exports for private account totaled 1,594,464,000 florins (\$637,785,000), as compared with 1,784,790,000 florins (\$713,916,000) in 1925. The substantial advance in the value of import trade was due primarily to larger purchases of cotton goods, machinery, and automobiles. Imports of automobiles, parts, and accessories increased 40 per cent in value. Lower rubber prices and decreased sugar output were mainly responsible for the decline in export trade.

The values of the leading import and export commodities in 1926, as compared with 1925, were as follows:

**CHIEF COMMODITIES
IN NETHERLANDS EAST INDIAN TRADE**

Item	1925 Thousand florins *	1926 Thousand florins *
Imports:		
Cotton goods and yarn	219,212	225,990
Provisions and beverages . . .	102,530	95,290
Rice	74,860	96,082
Iron and steel	52,560	59,700
Machinery and tools	44,477	62,130
Cigars, cigarettes, and tobacco	40,767	35,090
Wearing apparel	19,245	18,540
Artificial fertilizers	18,070	19,350
Glass, porcelain, and earthenware	16,364	15,530
Automobiles, parts, and accessories	18,433	26,360
All other	211,852	211,242
Total	818,370	865,304
Exports:		
Rubber and gutta-percha . . .	586,540	484,900
Sugar, all grades	367,290	269,640
Petroleum and products	152,530	203,200
Tobacco	110,470	96,980
Copra	102,390	83,270
Tin and tin ore	77,860	82,460
Tea	74,370	72,930
Coffee	68,230	70,280
All other	245,110	230,754
Total	1,784,790	1,594,464
Merchandise export balance	966,420	729,160

* The florin has a par value of \$0.402. It averaged \$0.4016 in 1925 and \$0.4009 in 1926. Conversions in the text are made at \$0.40.

Nearly 60 per cent of the import trade in 1926 was with the Netherlands, Great Britain, Japan, Germany, and the United States. While imports from the Netherlands increased in value, the share of the mother country in the total import trade remained at 18 per cent. Imports from Great Britain and Japan declined in both value and percentage, while imports from Germany and the United States advanced in both value and percentage. The Netherlands, the

United States, Great Britain, and British India were the countries of destination of 50 per cent of the total export trade in direct shipments in 1926.

FINANCE. Despite the intention of the Government of the Netherlands' East Indies to maintain a balanced budget in the future, the estimates for 1929, as finally submitted to the Volksraad (legislative assembly) for consideration on May 15, 1928, indicated a probable deficit of over 52,000,000 florins. As in previous years, however, the deficit, if it should finally result, will be incurred on the extraordinary services rather than on the ordinary transactions. The latter were budgeted for a surplus—a matter of much gratification to the Government, which for years had striven at all costs to balance at least the ordinary budget. Under ordinary economic conditions an estimated deficit may cause no anxiety; in many past years estimated deficits have been considerably reduced or turned into a surplus. Thus, although the estimates for both 1926 and 1927, as finally approved by the legislature, anticipated heavy deficits, the final accounts for those years showed surpluses—over 47,000,000 florins for 1926 and nearly 13,000,000 for 1927. Such favorable results were made possible by the high prices of tin and rubber, the production and sale of which are controlled by the Government.

In any analysis of the budget of the Dutch East Indies the importance of the price of tin and rubber in the world market must be kept in view. If the world prices of these staples is high the Government realizes large revenues, as was the case in 1926 and 1927; conversely if the price falls, revenues shrink and the budget estimates would be affected accordingly. It was quite unlikely, however, that the anticipated results for 1929 would show any improvement. The early forecast for a surplus for the fiscal year 1928 was shadowed by a decline in the price of tin and also by a sharp fall in the price of rubber. The deficit was expected to reach 57,000,000 florins. As the prospects for a rise in the price of tin and rubber in 1929 were expected to be poor, according to the Government's report, there was less likelihood of the fiscal results proving more favorable than they were estimated, unless, of course, certain public-works construction be deferred.

The public debt on Dec. 31, 1927, was 1,056,000,000 florins (\$422,000,000).

COMMUNICATIONS. In 1926, 11,506 steamers of 8,694,206 tons, and 8940 sailing vessels of 526,899 tons entered the ports of the Dutch East Indies. At the end of 1926, the total length of rail and tramways (state and private) was about 3870 miles (2930 in Java, 915 in Sumatra, and 25 in Celebes); the gross receipts about 118,176,000 florins; working expenses, 70,876,000 florins; number of passengers carried, 136,093,000.

GOVERNMENT. The territory is under the sovereignty of the Netherlands (see NETHERLANDS, THE), but is partly under direct government and partly under subject native officials. In 1917 and again in 1925 the mother country granted certain measures of home rule. The chief executive authority is the governor-general who is aided by a council of five members which acts partly as a legislative and partly as an advisory body. The Volksraad is a legislative

assembly including representatives of the natives, Europeans, and foreign Orientals, and has comparatively little power in internal affairs. The governor-general and the council are nominated by the crown. Governor-General in 1928, Dr. A. C. D. de Graeff, appointed Mar. 26, 1926.

DUTCH GUIANA, gē-ā'nā, or **SURINAM**. A possession of the Netherlands on the north coast of South America lying between French Guiana on the east and British Guiana on the west, bounded on the south by inaccessible territory reaching to the Tumuc-Humac Mountains. Area, 54,291 square miles: population, Dec. 31, 1926, 142,896, including Negroes and Indians. Capital, Paramaribo, with 45,703 inhabitants. The movement of population in 1926 was: Births, 3922; deaths, 2223; marriages, 365. Among the chief products are sugar, cacao, bananas, coffee, rice, maize, rum, and molasses. Gold production in 1926 was 253,608 grams, and that of balata, 563,000 kilos. The executive authority rests with a governor and an assisting council, both nominated by the Crown. Governor in 1928, Baron van Heemstra, appointed on May 23, 1921.

DUTCH REFORMED CHURCH. See **REFORMED CHURCH OF AMERICA**.

DUTCH WEST INDIES. The name applied to the Dutch possessions in the West Indies, viz., Dutch Guiana and Curacao. Consult those titles.

DWIGHT, JOHN WILBUR, American politician and former representative in Congress from the Thirtieth New York District, died at New York, January 19. He was born at Dryden, N. Y., May 24, 1859, and was educated at New Haven, Conn. He was elected as a Republican to the Fifty-seventh Congress and was reelected five times. He served as Republican "whip" of the House of Representatives. Mr. Dwight retired from political life in 1913 to devote his time to his duties as president of the Blue Ridge Railway.

DYE STUFFS. See **CHEMISTRY, INDUSTRIAL**.

DYNAMO-ELECTRIC MACHINERY. The manufacturers of electrical machinery in the United States reported that during the year 1928 the production had been greater in the aggregate than in any preceding year, and that in spite of the fact that prices had been reduced there had been many improvements resulting in higher efficiency, greater convenience, and greater reliability. The engineer had been active in devising new methods and new materials which had progressively reduced the size and weight of machines of a given capacity and also lessened the amount of labor required in their manufacture.

Of particular interest in the new method of construction was the rapid growth of the use of electric welding in the construction of dynamo-electric machines giving the so-called "fabricated steel" structure which was gradually eliminating the use of castings and reducing the amount of metal required. This was used in all sizes from the smallest motors to the largest turbo generators.

In the record of size of designs completed and placed in service were the 75,000-kw. single-cylinder turbo-generator unit operating at 1500 r.p.m. in Buffalo, a tandem unit of 94,000 kw. at 1500 r.p.m. for 16,500 volts for Long Beach, Calif., and a 188,000-k.v.a., 1800 r.p.m. cross-compound for the N. Y. Edison Co.

In the category of "in course of construction" there was the 160,000-kw., 1500 r.p.m. tandem-

compound for the Fourteenth Street Station of the N. Y. Edison Co. This machine consists of three turbines all on one shaft driving the one 160,000-kw. generator. An interesting novelty in this generator is that its armature has two electrically independent three-phase windings, each good for 80,000 kw. These windings lie in different slots and will be connected to separate sections of the main bus bars, thus tying the sections of the bus bars together like a reactor and reducing and localizing the dangerous effects of short circuits, yet permitting parallel operation of all machines. The largest combined unit so far under construction was the 208,000-k.v.a., 1800-r.p.m., 22,000-volt unit for State Line, Ill. It is a triple-compound turbine driving three generators. This was being constructed by the General Electric Co. It should be noticed that the voltage, 22,000, was also an advance over any previous values which were successively 13,800 and 16,500. Several other machines less noteworthy in other respects, were being built for 22,000 volts. See **POWER PLANTS STEAM; STEAM TURBINES**.

In the Hell Gate Station of the N. Y. Edison Co., there was being installed a 160,000-kw. turbo-generator designed by Brown Boveri and constructed partly at their factory in Switzerland and partly in the Hell Gate Station.

There had been an increase in the capacity of machines of very high speed, with a new record for 1928 in the United States of 12,500-kw. machines operating at 3600 r.p.m. In Europe they were building 40,000-k.v.a. machines operating at 3000 r.p.m., this speed being due to the popularity of the 50-cycle current in Europe.

The Conowingo Power Plant on the Susquehanna River was still under construction and the electrical units, of which seven were on order for the initial installation, are of 40,000-k.v.a. or 36,000 kilowatts, having 88 poles and operating at 82 r.p.m. These units, because of their low speed, were the largest in bulk and dimensions of any units so far built. Some were being constructed by the Westinghouse Co. and some by the General Electric Co.

The ultimate development contemplated 350,000 h.p., which would make it second to the development of the Niagara Falls Power Company of 452,000 h.p. and greater than the Muscle Shoals development of 260,000 h.p.

The closed ventilating system for large generators had increased in utilization and bade fair to become standard. Most of the existing installations used air, circulated through the machines and cooled by water coils; but on one installation, that of a synchronous motor in Pawtucket, hydrogen was used for cooling and it was claimed that the rating of this motor, which is 10,000 k.v.a. with air cooling, was increased to 12,500 k.v.a. This machine was totally enclosed in an explosion-proof case and was placed outdoors, which also was a novelty.

The size of synchronous converters had been pushed up a notch to a capacity of 4200 kw. in one unit. Of special interest also was the construction of some 200-h.p. d.c. motors to operate at 5000 r.p.m. driving centrifugal pumps. The synchronous converter was meeting serious competition in the mercury-vapor rectifier, which was being installed for the conversion of alternating to direct current for all sorts of work. It was reported that there were in the United States 77,000 kilowatts of these converters in service supplying direct current voltages from 250 up to

3000; some manually operated and controlled and others automatically operated, as a system of automatic operation had been extended to this type of apparatus.

The application of electrical machinery to marine work has made several noteworthy advances in the year 1928. Most important were the final tests on the U. S. airplane carriers, *Lewington* and *Saratoga*. The former made a trip of 2228 nautical miles from San Pedro to Honolulu in 72 hours and 34 minutes, which gives a sustained average speed of 30.7 knots. In a later test this same vessel made a speed of 34.82 knots. In December the *Saratoga*, a sister ship, made a speed of 34.99 knots in a test during which 213,000 horse power was developed by its steam-electric machinery, thus acquiring the title of the world's fastest ship.

For the mercantile service, the steamship, *Virginia*, was placed in service between New York and San Francisco. This is a steam-electric propelled vessel slightly larger than its sister ship, the *California*, which was placed in service in 1927. These vessels are of about 30,000 tons, develop 17,000 h.p. and a speed of from 17 to 18 knots with twin screws. The first British ship to be propelled by a steam-electric equipment was under construction and the propelling machinery had been ordered from an American manufacturing company. The vessel was to ply between England and Australia. It is of 19,000 tons and was designed to have a speed of 19 knots.

Many minor developments have occurred in the line of Diesel-electric ship propulsion. The U. S. Shipping Board revamped one of its older ships which had a 3000-h.p. geared turbine and single screw by equipping it with four 880-kw. Diesel-engine-driven generators and one 4000-h.p. double motor operating at 60 r.p.m. with 1500 volts direct current giving a speed of 13 knots. All the deck auxiliaries are also electrically driven. The Diesel type of propelling machinery gives a much greater range of action without refuelling. It is also possible, where required, to control the propelling machinery from the bridge or pilot-house, as is done in some vessels for harbor and river navigation and in tug-boats. There were in 1928 in operation numerous ferry-boats with Diesel-electric propulsion and one of 4500 h.p. had been ordered for Messina, Italy.

Automatic control of hydro-electric stations had been extended to still greater capacities in the Shipping Point Station on the Ohio River. Here a plant of 100,000 k.v.a. capacity, consisting of eight generators of 12,500 k.v.a. each at 14,000 volts, are started and synchronized automatically and so protected that one man operates the whole station. The economic reason for the arrangement is that the plant is only used part time because of the variable flow of water and lack of storage facilities.

Another development in remote control is the reading of electric meters over telephone or other two-wire electric circuits. Several instruments in a distant station without operator may be read over one pair of wires and recorded either visually or graphically at the load dispatcher's headquarters or another power station. In some cases, a carrier-current channel may be used to accomplish the result. The method consists of automatically sending a series or set of impulses from the meter to be read to an ingenious device which records a figure proportional to the number of impulses in the set.

EADIE, DENNIS. British actor-manager, died at London, June 10. He was born at Glasgow, Jan. 14, 1875, and began his theatrical career in 1899, as a member of a touring company. He made his first London appearance in 1900, and thereafter, until his death, was one of the most versatile and popular players of England. He played leading rôles, principally in comedy, but his repertory included parts in melodrama, "cloak-and-sword" plays, musical comedy, and motion pictures. In twenty-nine years he played more than eighty parts. Among the plays in which he acted were *The Prisoner of Zenda*, *Rupert of Hentzau*, *Milestones*, *Man and Superman*, *Arsène Lupin*, *My Lady's Dress*, and *The Man Who Stayed Home*. Mr. Eadie was also manager of the Royalty Theatre.

EARTH, STUDY OF. See GEOLOGY; ASTRONOMY.

EARTHQUAKES. It is estimated that an earthquake is felt in some part of the world on an average of at least 4000 times annually; in the United States alone, two hundred or more are usually reported each year. Fortunately, the vast majority are feeble and harmless, or else occur under the sea or in thinly populated districts. The year 1928 had the usual quota of quakes, many of which caused considerable local damage and loss of life, with a few ranking as severe disasters.

A series of intense quakes, the most violent ever felt in the region, occurred in southern Bulgaria during the latter half of April. The epicentre migrated westerly during the series, along a line parallel to the Balkan ranges; and the great area of the damaged regions indicated a deep-seated focus. Over 100 lives were lost, 700 injured, many thousands rendered homeless, and nearly 20 million dollars' damage caused.

Corinth, Greece, was shaken by a series of quakes beginning April 22. The focus was shallow, and the damaged areas small. The region of Greece is the most seismically active in the world, exceeding even Japan in this respect.

Southern Chile was rocked on December 1 by a quake which killed over 200, and resulted in great property destruction, especially in Talca and Chillan. Considerable destruction was caused by severe quakes which shook the Mexican province of Oaxaca and neighboring regions on March 22, April 13 and 17, June 16, and October 8. Three villages were destroyed in Kaledijk, Turkey, October 4. Mucasani, Peru, was destroyed April 9. Nehandan, Persia, was wiped out March 10. Quakes in Smyrna, Turkey, on March 31 and April 24 resulted in the deaths of 50 people, and caused heavy damage. Several severe quakes took place during the year near Seward, Alaska, but no damage was caused. Semi-destructive quakes occurred in northeastern Italy, near Udine, on March 26 and 27. See SEISMOLOGY; GEOLOGY.

ECLIPSES. See ASTRONOMY.

ECONOMIC ASSOCIATION, AMERICAN. An organization founded in 1885 at Saratoga, N. Y., to encourage economic research, to issue publications on economic subjects, and to encourage complete freedom of economic discussion. The membership, which in 1928 totaled 3507, comprises persons interested in the study of political economy or the economic phases of political and social questions, and includes college professors, lawyers, business men, and politicians, with pro-

ssional economists in the minority. During the first twenty-five years of its existence the association published mainly monographs on social economic topics, dealing largely with current problems, which make up twenty-eight volumes, and furnish the best existing guide to the progress of economic thought in the United States. In 1911, *The American Economic Review*, quarterly, first made its appearance. *The Review* aims to publish material showing the progress of economic thought, along such lines

"Economic Theory," "Money, Banking, and Credit," "Accounting," "Taxation and Finance," "Agriculture," "Market Distribution," "Foreign Commerce," "Economic History," "Labor Problems and Standards of Living," etc. The Association, which meets annually, convened in 1928, at the Stevens Hotel, Chicago, Ill., December 26-29. The officers for 1928 were: President, Fred M. Taylor, University of Michigan; vice presidents, Frank L. McVey, University of Kentucky and Jessica B. Peixotta, University of California; executive committee, Richard T. y, Northwestern University, Clyde, O. Ruggles, Ohio State University, Fred R. Fairchild, Yale University, George W. Dowrie, Stanford University, William H. Kiekhofer, University of Wisconsin, and Edmund E. Day, University of Michigan; secretary and treasurer, Frederick S. Sibley, Northwestern University, Evanston, Ill.

ECONOMIZERS. See BOILERS.

ECUADOR, ɛk'wá-dôr. A South American republic on the northwest coast of the continent between Colombia on the north and Peru on the south. Capital, Quito.

AREA AND POPULATION. The area in 1928 was still undetermined because of the boundary dispute with Peru, but was variously estimated by different authorities at from 116,000 to 276,000 square miles. The population was estimated approximately 2,000,000, about three-quarters of whom were Indians and the remainder of mixed blood. The last official census in 1903 placed the population at 1,328,821. The chief towns with their populations are: Quito, 80,000; Guayaquil, 100,000; Cuenca, 30,000; Riobamba, 12,000; and Ambato, Loja, and Latacunga, each with about 10,000 inhabitants.

EDUCATION. Elementary instruction is free and compulsory. Institutions of higher learning include the Central University at Quito, the Guayas University in Guayaquil, and the Azuay University in Cuenca. There is also a law college at Loja.

PRODUCTION. Ecuador is primarily an agricultural country, and it is from this source that the bulk of its income is derived. The principal agricultural products are cacao, ivory nuts, sugar, coffee, and cotton, but a variety of others such as corn, rice, beans, lentils, and fruits are grown and a portion of the production exported. Rubber, cinchona bark, kapok, and broom, macorina, and toquilla straw are also important vegetable products appearing in the exports. Cacao is the leading crop, and while Ecuador is not dependent on one crop to the same extent as certain other Latin-American countries, nevertheless, cacao is a major factor in determining the trend of business conditions. The country is one of the chief

producers of cacao, ranking after British West Africa and Brazil. Until 1905 Ecuador was the largest producer of cacao in the world, but the expansion of production in British West Africa and Brazil forced Ecuador into third place; for while the 1926 production in the last named country was considerably below that of 20 years ago, world production in the same period more than doubled. In fact, with the ravages of the witch-broom and the Monilia diseases, Ecuador is becoming less and less a factor in the world cacao market. The production in 1926 was 430,976 quintals as compared with 692,700 quintals in 1925.

Ecuador has practically monopolized the production of Panama hats which are produced at the rate of 700 dozen per month. The mineral resources include gold, silver, petroleum, copper, iron, lead, coal, and sulphur, but mining is almost exclusively confined to gold, of which practically the entire output is exported to the United States.

FINANCE. As originally passed the ordinary budget of Ecuador balanced at 51,888,000 sucres and the extraordinary budget balanced at 12,327,450 sucres. By a decree of June 13, 1928, various amendments were made to the budget for 1928 as originally passed. As a result of these amendments, the ordinary budget balanced at 55,393,069 sucres. Of the increase, the sum of 2,269,100 sucres was added to the appropriation for the service of the public debt, the remainder being divided among several other items. During the course of his address on the occasion of opening the Mortgage Bank of Ecuador on Mar. 4, 1928, Dr. Ayora, Provisional President of the Republic, stated that the internal debt of the Republic, which on Dec. 31, 1925, amounted to 49,355,427 sucres, was reduced to 17,018,666 sucres by June 30, 1928.

The *Registro Oficial* for Jan. 2, 1928, contained a new income tax law, suggested by the Kemmerer Commission (see preceding YEAR BOOKS) to replace the former law on that subject. The law establishes a tax of 8 per cent on all income derived from investments, with the exception of the profits of individuals derived solely from agriculture, certain interest collected and paid by banks, the interest of cooperative societies, and interest on investments of public institutions. Flat payments were required on graduated incomes and additional percentages charged on the balance after the flat deductions had been made. The following exemptions were allowed: An unmarried person, 2000 sucres; the head of a family, 3000 sucres; each dependent under 18, or over 18 if physically or mentally unable to support himself, 500 sucres; and amounts deducted for pension funds from the salaries of public employees.

COMMUNICATIONS. Guayaquil is visited by the steamships of nine European lines by way of Magellan Straits, as well as by vessels plying only on the Pacific. There are about 500 miles of railway. The 1928 budget contained appropriations of 4,119,500 sucres for the promotion of communications, of which 700,000 were to be spent on railway construction from Puerto Bolívar to Laja, 910,000 from Quito to Esmeraldas, and 1,000,000 from Sibambe to Cuenca. An executive decree of Feb. 13, 1928, terminated the contract between the Government and a foreign company for the construction of the Quito-Esmeraldas Railway, at the same time authorizing the

Bureau of Public Works to receive the section under construction from Quito to Ibarra and to continue work on the railroad.

GOVERNMENT. Nominally, under the constitution, executive power is vested in a president elected for four years, who acts through a cabinet of five ministers; and legislative power in a congress of two houses, a senate of 32 members and a chamber of deputies of 48 members. For the existing government consult the *YEAR BOOK* for 1926. Provisional President in 1928, Dr. Isidro Ayora.

HISTORY. Ecuador passed through a quiet and prosperous year under the benevolent dictatorship of Dr. Isidro Ayora. He stated from time to time that he was willing to step down from his position as dictator as soon as the conditions warranted. He felt, however, that the time was not ripe as yet. In many circles it was firmly believed that if constitutional elections were held he would be returned as chief magistrate of the nation. In accordance with his oft-repeated statements, he announced in the early summer that elections for a National Assembly to consist of 54 members would be held in the last week of August. The elections were held and were conducted with comparative quietude. As was expected, he was elected to the position of President by an almost unanimous vote, declaring that he would hold office only until a new constitution was drawn up and promulgated. On November 19, Don Gonzalo Zaldumbide presented his credentials at Washington as the officially accredited representative of Ecuador in the United States.

EDUCATION IN THE UNITED STATES.

STATISTICS. The U. S. Bureau of Education in 1928 published a statistical survey for the school year 1925-26. The enrollment in the kindergarten and the elementary school was 23,127,102. The total enrollment of secondary students was 4,132,125. The enrollment in the elementary schools had increased 63 per cent in the 36 years since 1890. The general population, however, increased 87 per cent, while the school population, those of ages 5 to 17 inclusive, increased 62 per cent. It appeared, therefore, that the enrollment in public schools had kept pace with the school population, but the school population had not increased as rapidly as the general population.

The enrollment in secondary schools since 1890 exhibited an increase of 1.055 per cent. In 1890 only 1.6 per cent of the school enrollment was in high schools. In 1926, 15.2 per cent of the total enrollment was in the high school.

The total cost of the public elementary schools including kindergartens was \$1,328,396,455. The public high schools cost \$697,911,735. The cost per pupil in the elementary schools, therefore, was \$63.31, and the cost per pupil in the high school was \$185.74. The value of public, elementary, and secondary school property was \$4,676,703,539.

There was no certainty regarding the number of school buildings because there were no data concerning private elementary schools. The States reported 256,104 school buildings. Of this number 16,291 were consolidated schools and there were no less than 16,531 one-room school buildings.

There were approximately 21,700 public high schools and 2,500 private high schools. The public elementary schools employed 644,631 teachers. The public high schools employed 169,538 teachers. The smallest number of men teachers

was listed in 1920 when there were 63,024 men teaching in the elementary schools and 32,386 teaching in public high schools. In 1926 there were 75,436 men teaching in public elementary schools and 63,374 teaching in public high schools.

ADULT EDUCATION. The movement to provide for the education of adults has progressed steadily during the year, 1928. There were no noteworthy changes in the policies that were established earlier, but the offering had become better organized and apparently more persons were making use of the courses offered. (See *ADULT EDUCATION, AMERICAN ASSOCIATION FOR.*) The U. S. Bureau of Education had collected information from various institutions regarding their facilities for helping in adult education. The results were published in *Bulletin No. 3*, 1928. Among the more important offerings were the following:

Correspondence study courses. Practically any subject desired by a student may be taken through a correspondence course conducted by some institutions in the country. The student is expected to write all of the lessons and send them to the instructor. He in turn corrects the papers and returns them with his criticism. Anyone who may be interested in correspondence courses should write his State university.

Class Work Outside of Institutions. It was claimed that in every State of the Union there are institutions of higher learning that give class work outside of their walls. An instructor from the institution concerned meets the classes and conducts the work in much the same manner as is employed within the institution. In most cases the institutions are compelled to require a certain minimum enrollment in order to justify them in providing the instructor. In some cases this minimum is as low as ten persons. Any individual desiring information regarding the possibility of extension work in his own community should make inquiry from his public-school department.

Public Lectures and Lyceums. It was reported by 195 colleges and universities that they rendered service for women's clubs, teachers' institutions, commencement exercises, and so on by providing lecturers either from their own faculties or from other sources. Many of them also furnished music and slides and films to illustrate lectures that may be used by local talent.

Visual Instruction. It was reported by 52 colleges and universities that they furnished visual aids for instructional and entertainment purposes. Some of these institutions offered short courses to teachers and club leaders on how to make use of visual aids that they supplied.

Home Reading Courses. It was reported by 37 institutions that they provide home reading courses. The U. S. Bureau of Education provided no less than 31 such courses. The American Library Association supplies a series entitled *Reading With A Purpose*. There are short reviews of the books to be read. In addition to the courses supplied by the U. S. Bureau of Education and the American Library Association courses were prepared by the institutions themselves.

Publications Educational in Nature. All State universities, land-grant colleges, and some other institutions distribute publications educational in nature. In addition the Federal Government issues many leaflets, bulletins, and other publications for general distribution. Anyone in-

erected in such publications should communicate with their State university or with the Superintendent of Documents, Government Printing Office, Washington, D. C.

Public Information and Package Library Service. Information service for the public was rendered by 59 colleges and universities. This offering took the form of library service in which the use of the institution's library is made available to all who request it or package libraries which are made up largely of magazine clippings selected from current issues of pamphlets and reports. Some of the institutions collect and send packages on more than one thousand subjects. To supplement the assistance offered by library and package-library service some of the institutions through extension divisions prepare and supply bibliography and study outlines. The University of North Carolina furnished such assistance to no less than seven hundred clubs during one year.

Community Drama. There were 54 colleges and universities assisting local communities in interpreting through pageants, folk plays, and dramas the spirit and the history of the State. The University of Indiana has a collection of more than one thousand plays that are suitable for schools, churches, and clubs.

Institutes, Conferences, and Short Courses. There were 141 institutions equipped to aid local communities by holding institutes, conferences, or short courses. The conferences and institutes deal with local or State problems. The courses deal with a great variety of subjects such as various phases of farming and home problems. There is an increasing demand for short courses for business men and technical workers in such subjects as salesmanship, applied psychology, highway engineering, and banking.

Parent-Teacher Association or Other Club Service. There were 64 institutions equipped to promote parent-teacher associations or other club service by assisting in the formulation of programmes, distributing literature, and in some cases by helping in the preparation of monthly bulletins. The parent-teacher movement had developed to such an extent that a number of colleges provided courses on the principles, practices, and policies of parent-teacher associations.

Radio. There was an increasing number of courses offered by radio. Radio was used by 65 institutions either in giving lectures or in conducting other extension work. At present there is no way of determining how many people are assisted by such courses, but 5000 people enrolled for courses given by radio by the division of university extension of the Massachusetts State Department of Education.

INTELLIGENCE TESTING. Since the World War American public schools have given much attention to testing the intelligence of pupils. While this plan is not universal, it is true that a great number of pupils in the United States have been tested. In recent years there has been a marked tendency toward grouping children on the basis of their abilities. The child's standing in the intelligence test has been one basis for such grouping. In the language of the school, there have been X, Y, and Z groups. Usually the X group represented those of superior ability and attainments; the Y group, those who are normal; and the Z, those who are in-

ferior. This method of grouping children has developed as a logical procedure rather than as the outcome of definite research. It has brought in its wake many protests and a large amount of dissatisfaction. Those who have favored the plan have undertaken to answer the objections that have been raised, and they have made a very plausible case for intelligence testing.

In the ten years since the War there had developed three well-defined positions in regard to intelligence testing, especially as applied to public-school children. Those who have been instrumental in developing the intelligence tests have in general assumed a very decided validity for the tests. They have asserted in effect that intelligence is an inherited quality and that it does not change. There have been schools in which children have had their intelligence tested in the first grades, and this has been taken as a measure of their intelligence throughout the elementary school period. Those who employed this procedure have made the assumption that intelligence can be measured, and is measured by tests that are now in existence.

Directly opposed to the view just mentioned has been a conception that intelligence cannot be measured by any of the devices that are in existence at the present time. Those who advocate this view insist that even though it were possible to measure intelligence it would be a most dangerous procedure, for it would inevitably lead into an aristocracy on the one side and to unlimited discouragement and distress among those who made poor showings in the test. They, therefore, condemn unqualifiedly any attempt to make use of any intelligence testing in the public schools.

There is a third group who have insisted that the intelligence tests as developed tend to measure environmental influences quite as much as they measure inherited capacities. This group would not condemn the use of the tests, but they do condemn the interpretations that have been placed upon the results.

During the year 1928 the results of different investigations were brought to bear upon the settlement of the controversies. The National Society for the Study of Education appointed a committee of outstanding psychologists who brought together in a year book the significant investigations. The year book which appeared in February is entitled *Nature and Nurture, Their Influence Upon Intelligence*. Briefly stated, the results of investigations and experiments seem to show that the child's intelligence as measured by tests is affected by environment.

It was too early to determine the effect that these investigations have had upon the practice in the schools, but it was true that nothing in recent times was more discussed in educational circles than the findings of these investigations.

SPECIAL SCHOOLS. *Schools and Classes for the Blind.* For the school year 1926-27, a total of 80 schools reported to the U. S. Bureau of Education. In these institutions there was an enrollment of 6084 pupils. During the year 177 were graduated from the high-school departments. The total receipts of the schools were \$4,028,145, and the expenditures were \$3,993,404. The total value of the buildings and grounds was \$17,283,141. The value of apparatus, furniture, libraries, etc., was \$2,151,091. In

the libraries of these schools there were 157,380 volumes in raised type.

Schools for the Deaf. For the school year 1926-27 a total of 168 schools reported to the United States Bureau of Education. Of these 69 were supported by the State, 83 were parts of the city school systems, and 16 were under private control. The State schools enrolled 13,134 pupils and graduated 246. The city schools enrolled 3515 pupils and graduated 2, and the private schools enrolled 933 pupils and graduated 5. The total enrollment was 17,582. Of the total enrollment 6.6 per cent was in the high school, 29.6 per cent in the grades five to eight, 52.3 per cent in grades one to four, and 11.5 per cent in the kindergarten. Sixty State institutions and 10 private institutions reported receipts of \$7,095,631 and \$273,216 respectively. Sixty-four State institutions and 10 private institutions reported expenditures of \$7,612,739 and \$265,289 respectively. Among the schools reporting, the per capita expenses for current expenses was \$500 in the State schools and \$329 in the private schools. Sixty-two State institutions and 11 private institutions reported property valued at \$30,489,217 and \$1,793,363 respectively. This makes the value of property per pupil \$2,401 in State and \$2,657 in private institutions. The State schools employed 1724 instructors; city schools reported 417; and private schools, 162. This is a total of 2303 of whom 450 were men and 1853 were women.

Schools for Feeble-minded and Subnormal. For the school year 1926-27 a total of 303 schools reported to the United States Bureau of Education. Of these 51 were State Schools, 218 city day schools, and 34 private schools. The enrollment in the State schools was 49,791; in the city day schools, 51,814; and in private schools, 4416, a total of 104,021. Compared with the reports for 1914, there had been an increase of 78 per cent in the State schools, 376 per cent in city day schools, and 964 per cent in private schools. The receipts and expenditures for the city day schools had not been separated from the other educational receipts and expenditures. Of the State institutions, 49 report receipts amounting to \$17,588,311 and a total expenditure of \$17,048,943. In the State schools that reported both enrollment and expenditures, the expenditure per pupil for current expenses was \$286, and for buildings and lasting improvements \$66. The 49 State institutions report buildings and grounds valued at \$47,675,570 and apparatus, furniture, etc., \$6,921,610. This makes the value of property per capita enrolled \$1136.

The receipts in 24 private institutions were \$1,372,428, while 25 schools reported expenditures amounting to \$1,335,212. In the private schools reporting the expenditure per pupil, current expense was \$649, and lasting improvements \$71. In private schools the value of property per capita enrolled was \$1906. The State schools employed 580 instructors and 4047 assistants. The private schools employed 195 instructors and 435 assistants. The city day schools reported 2718 instructors and no assistants.

Industrial Schools for Delinquents. For the school year 1926-27, a total of 158 institutions reported to the United States Bureau of Education. There was reason to believe that there were at least 173 such schools. The inmates in these 158 schools numbered 65,174 boys and 19,143 girls, a total of 84,317. Of the inmates

72,803 were whites and 11,514 were colored. It is estimated that 7 per cent of the population 5 to 20 years of age is foreign born, while the number of foreign-born inmates in the schools reporting was 6 per cent. Ninety-one schools reported the inmates committed as 24,110. Of this number 2271 or 9.4 per cent could neither read nor write. One hundred fifty schools having an average enrollment of 42,645 reported property valued at \$81,930,652. The per capita investment, therefore, was \$1921. The total receipts for the school year were \$22,941,094 of which \$17,621,732 was for current expenses and \$2,869,309 was for permanent equipment. The receipts from public sources were \$18,500,390.

The expenditures totaled \$22,303,966. Teachers' salaries and teaching equipment cost \$2,118,873. The salaries of helpers and other expenses were \$14,014,847.

See **PSYCHOLOGY.**

EDUCATIONAL PSYCHOLOGY. See **PSYCHOLOGY.**

EGBERT, WILLIAM GRANT. An American violinist, died at Ithaca, N. Y., December 9. He was born at Danby, N. Y., Dec. 28, 1869. At the age of eight he made his first appearance in public, but continued his studies under local teachers in Syracuse, where he also attended the university. From 1890, for two years, he was a pupil of Joachim in Berlin. He then settled in Ithaca, where he founded the Ithaca Conservatory of Music, which became one of the foremost schools of the United States. From 1903-06 he was in Prague, with Ševčík, studying that master's new method and filling at the same time the position of concert-master and assistant-conductor of Ševčík's String Orchestra. After his return to America he introduced the new method in his own conservatory. Accepting his former pupil's invitation, Ševčík personally conducted there a master-class in 1921-22.

EGGS. See **LIVESTOCK.**

EGLIN, WILLIAM CHARLES LAWSON. American electrical engineer, died at Philadelphia, Pa., February 7. He was born at Glasgow, Scotland, July 14, 1870, and was educated at the Andersonian University, Glasgow, and the University of Glasgow. He went to America with his family in 1880, and in 1889 became connected with the Edison Electric Light Co., of Philadelphia; at the time of his death he was vice president and chief engineer of the Philadelphia Electric Company. He designed many of the company's plants, notably the modern main generating station on Christian Street, and until shortly before his death was engaged in the construction of the company's extensive hydroelectric project at Conowingo, Md. Mr. Eglin was president of the Franklin Institute of Philadelphia.

EGYPT. A kingdom in northeastern Africa, governed by a king since Mar. 15, 1922, after the termination of the British protectorate declared Dec. 18, 1914; occupying the Valley of the Nile, the Libyan desert, the region between the Nile and the Red Sea and the Sinai Peninsula; claiming jurisdiction also over the Sudan, which claim, however, is denied by the British. Capital, Cairo.

AREA AND POPULATION. The total area of Egypt proper which is described above is about 383,000 square miles. This figure does not include the Sudan. The cultivated and settled area, comprising the Nile Valley and Delta, is only 12,-

023 square miles. The last census of the settled area, taken on Feb. 18-19, 1927, gave the total population at 14,168,756; as compared with 12,750,918 at the census of March, 1917. The chief cities with their populations at the census of 1927 were: Cairo, 1,059,824; Alexandria, 570,314; Port Said (including Ismailia), 103,223; Suez, 35,547; Tanta, 89,712; Mansura, 62,815; Asyut, 57,036; Damanhur, 51,720; Fayum, 52,372. In 1917 the population was distributed among the various religions as follows: Mohammedans, 11,658,148; Greek Orthodox, 854,778; Roman Catholics, 107,687; Jews, 59,581; Protestants, 47,481. The movement of population in 1926 was: Births, 623,825; deaths, 343,864.

EDUCATION. Primary instruction is supplied by native schools called *maktabs*. In the school years 1925-26 the number of these receiving grants-in-aid and under government inspection was 2762, with 202,795 pupils and 5220 teachers, while those under the immediate direction of the Government in 1927 was 337 with a total attendance of 49,531. In addition there are higher elementary and higher primary schools, a few schools for special and technical training, and higher colleges of law, engineering, military science, veterinary science, agriculture, pedagogy, commerce and accounting, and medicine. The total number of schools under the control of the provincial councils in 1927, either through direct management or through grants-in-aid was 3899, with 339,999 pupils. The centre of Moslem culture is the mosque and university of El-Azhar at Cairo, founded in 972.

PRODUCTION. Following the depression of 1926, there was an improvement in the price of cotton during 1927, which had a favorable effect on the country's general economic condition. The estimate of the cotton crop for 1927 indicated a smaller yield than in the previous year, amounting to 1,252,000 bales (averaging 478 pounds net) as against 1,497,000 bales in 1926 and 1,629,000 bales in 1925. The acreage sown to cotton, in conformity with the Government's policy of restricting cotton growing to one-third of Egypt's cultivable land, decreased from 1,785,702 feddans (1 feddan equals 1.038 acres) in 1926 to 1,516,199 feddans in 1927. The cotton crisis of 1926 had also tended to divert agricultural activities more and more from cotton growing to other crops, in order to avoid the unfavorable consequences that might result from entire dependence on a single commodity. See **COTTON**.

The sugar industry, which had been affected in the previous year by a large world crop, was less active in 1927. A total of 702,260 tons of cane was worked in 1926-27 by the leading company as compared with 967,970 tons in the previous year. The sugar yield of cane, however, increased from 12.7 per cent to 12.86 per cent in 1926-27. The total production of raw sugar was 71,550 tons, as against 95,900 in the previous year. This quantity was augmented by imports from the Dutch East Indies. No later statistics for the area and production of other crops were available than those given in the preceding **YEAR BOOK**. In 1926 there were in Egypt 36,467 horses, 738,662 donkeys, 22,858 mules, 721,738 cattle, 763,134 buffaloes, 1,143,554 sheep, 529,972 goats, and 171,093 camels. The principal mineral products in the same year were (in metric tons): Phosphate rocks, 232,008; petroleum, 172,952; manganese iron ore, 121,868. Other

products are nitrate shale, carbonates and sulphate of soda, ochres, sulphate of magnesia, talc, building stones, clay, gypsum, nitrate of soda, salt, and turquoise.

Important irrigation work was undertaken during 1927. In April a contract was signed for the construction of a barrage of Nag Hamadi, midway between the Assiout and Isnah barrages. The object of the barrage is to change the system of irrigation of 500,000 feddans of land west of the Nile from basin to perennial watering, thus doubling or trebling the number of crops per year. Through canalization it will also perennially irrigate 115,000 feddans east of the Nile and will add 300,000 feddans on the west to basin irrigation. The cost of the barrage was estimated at £E1,976,555. The work during 1927 was financed by a budgetary credit of £E250,000, but this was exhausted before the end of the year. The budget draft for 1928-29 carried a credit of £E2,250,000 for continuation of the work on the barrage and on the canalization, which is expected to be completed around 1930.

COMMERCE. A remarkable readjustment occurred in the foreign trade position of Egypt during 1927. Although the balance for the year was unfavorable by £E379,330, this amount was insignificant as compared with the large adverse balance of £E9,270,000 in 1926. The trade deficit in that year, the first since 1921, caused a serious depression from which a gradual recovery was registered during 1927, largely in consequence of the higher prices obtainable for cotton.

Imports from the United States were valued at \$11,373,000 as against \$12,371,000 in 1926. Exports to the United States during 1927 were valued at \$33,998,000 as compared with \$27,921,000 in 1926.

FINANCE. Government finances disclosed a strong position in 1927. The reserve fund at the end of the year was estimated at £E35,000,000, as against approximately £E33,000,000 at the close of 1926. This large reserve fund, however, has elicited considerable comment from commercial circles, where it is charged that the fund is being allowed to remain unproductive in the face of urgent need for extension of transport facilities. The proposed budget for 1928-29 showed an increase in both receipts and expenditures over the approved budget for 1927-28. Receipts were stated at £E37,532,000 and expenditures at £E41,532,000, indicating a draft of £E4,000,000 on the reserve fund. This compares with an approved budget for 1927-28 showing receipts of £E36,277,000 and expenditures of £E38,919,000 and involving a draft of £E2,642,000. The principal increases anticipated in revenues for 1928-29 over the previous year were from railways, interest on invested funds, and miscellaneous receipts; larger expenditures were provided for pensions and indemnities, and for the ministry of public works.

COMMUNICATIONS. On Apr. 30, 1927, there were, exclusive of sidings, 2272 miles of rails (double and single) belonging to and worked by the State, and 854 miles of light agricultural railroads owned by private companies. The railroads reported a satisfactory year in 1927, although increasing competition was being encountered from motor-bus traffic. The increase in automobiles has also rendered inadequate the present road facilities, and an expansion of the road system of the country is being planned. Two important weekly services were inaugurated dur-

ing the year—a weekly air service between Cairo and Bagdad, with an extension to Karachi, and a through rail service between Calais and Cairo, via Constantinople and Tripoli, with a break from Tripoli to Haifa, Palestine, covered by automobile.

The number of vessels calling at Egyptian ports in 1927 increased to 8393 from 7798 in the previous year. Cargo landed during the year totaled 5,438,000 tons, as against 4,955,000 tons in 1926; cargo shipped amounted to 1,952,000 and 1,550,000 tons, respectively. Two important harbor projects for the port of Alexandria were approved during October, 1927. These involve a petroleum basin, at an estimated cost of £E320,000, and nitrate quays, at a cost of £E300,000.

GOVERNMENT. According to the constitution, promulgated Apr. 19, 1923, Egypt was proclaimed a sovereign State under a hereditary monarch, with representative government. Equal rights, irrespective of race, language, or religion, were guaranteed, as was the liberty of the individual and religious belief. Executive power is vested in the king, who also exercises legislative power in concurrence with the legislature. The latter consists of a senate and chamber of deputies, the senate to be composed of three-fifths elected by universal suffrage and two-fifths (including the president) appointed by the king (the term of office is ten years; one-half is renewed every five years); and the chamber of deputies consists of members elected by universal suffrage for a period of five years. The king can dissolve the chamber of deputies to which the cabinet is individually and collectively responsible. Mohammedanism is the State religion and Arabic the official language. King in 1928, Fuad I, who acceded to the throne Mar. 15, 1922.

HISTORY

The turbulent year through which Egypt passed in 1927 was merely an introduction to the events of 1928 when Anglo-Egyptian relations became more strained than ever before, if possible. At the very beginning of the period there were rumors that there were serious internal breaches in the Egyptian cabinet and that it might cause the resignation of Sarwat Pasha, the prime minister. The trouble blew over temporarily, however. As noted in the preceding YEAR BOOK there had been serious difficulty with Great Britain over the question of the status of the Egyptian Army, particularly with reference to the Sudan. The outcome of the dissension was the negotiation of a new treaty in the last part of 1927 and early 1928. The terms of the treaty, which was evidently based on Great Britain's desire for security in Egypt because of the necessity for control of the Suez Canal, were unsatisfactory to Sarwat Pasha's Government, and, after informing the British representatives of that fact, Sarwat offered the resignation of the cabinet to King Fuad, who induced him to hold office until a new ministry could be formed. If a new cabinet were formed from the dominant Nationalist party in the Egyptian Legislature it was almost a certainty that the demands of Great Britain would be again refused.

Although the provisions of the proposed treaty were not published at the time, it was stated in the press that among the provisions were the stationing of a British Army in Egypt for a definite space of time and the participation by Egypt on the side of Great Britain in case the

latter should become involved in a war. The status quo in the Anglo-Egyptian Sudan was to be maintained. It seems only natural to an outsider that the Egyptians should strenuously object to the presence of an alien army on the sovereign soil of a supposedly independent country.

On March 16, Mustapha Nahas Pasha, the leader of the Nationalist party, succeeded in forming a cabinet in which he himself took the posts of Prime Minister and Minister of the Interior. He stated that his only policy was stoutly to maintain the inviolability of Egyptian soil. Just prior to his selection, the terms of the Anglo-Egyptian Treaty were published by the British Government. The provisions were mainly those mentioned above. The treaty was rejected by the Egyptian cabinet, whereupon the British Government dispatched a note to the effect that, although it refrained from speaking while the treaty was being negotiated, it must call attention now to the fact that certain acts of legislation of the Egyptian Parliament dealing with the question of bearing arms and the election of heads of villages were distasteful to the British Government, which reserved the right to act as its best interests dictated. Prime Minister Nahas replied to this note of the British Foreign Office to the effect that it was an invasion of Egypt's sovereign rights which contemplated interference with internal affairs and would not be accepted in principle or fact.

The British reply, while still diplomatic, stated that Egypt could only exercise her sovereignty in internal affairs, when such action did not conflict with Great Britain's interests. Needless to say, the exchange of notes produced a high feeling in Egypt against Great Britain, and when Parliament reassembled and continued to discuss the bills objected to by Great Britain, the London Government dispatched several battleships to Egyptian waters and handed a virtual ultimatum to the Cairo authorities, demanding a statement in writing that the bill objected to (in this case a measure dealing with public assemblies) would not be proceeded with. In replying to this note Premier Nahas Pasha again denied the right of the British Government to interfere in internal affairs of Egypt, but saved the situation for the time being by saying that final action on the bill would be delayed until the November session of Parliament. Downing Street expressed satisfaction with this reply, but stated that if such measures ever came up again in the Egyptian Parliament, it would feel justified in intervening again. The tension for the time being was greatly relieved. Undoubtedly the action of Nahas Pasha prevented armed intervention in Egypt by Great Britain.

The flurry with Great Britain was followed in June by dissensions within the cabinet, followed by the resignation of several members because of the feeling that the Prime Minister failed to consult them on important matters. Mustapha Nahas Pasha was also attacked on the grounds of lacking personal integrity as were other leaders of the Nationalist party, and King Fuad asked for his resignation. When this was refused, the King dismissed the ministry on June 25.

In forming a new cabinet the King entrusted the leadership to Mahmud Pasha, a member of the Liberal party. He gathered about him a coalition cabinet comprising many of the members of the old cabinet and stated that he con-

sidered it a cabinet of transition to bridge the affairs of state until a settlement could be made between the various political groups of the country. After announcing a suspension of Parliament for a month in accordance with a provision of the constitution, the King and his new Prime Minister on July 19 issued an entirely unconstitutional decree by dissolving Parliament altogether for a period of three years, stating that legislation would be carried on by decree. The British Government stated that it had nothing to do with the issuance of such an order. The excuse given for this drastic action was the gradual disintegration of the internal administration. The Nationalist party protested and declared that it would hold meetings of its members anyhow, despite the statement of the King that such action would be met by drastic measures.

On the day appointed for the meeting of the Nationalist members of the legislature, no one appeared at the Parliament houses, but a meeting was held in private and the action of the Government condemned. In the meantime speeches were delivered throughout the country in the same tone, although no disorder took place. Thus the political status rested until the close of the year. The Nationalist members of the dissolved Parliament held secret meetings, but apparently accomplished nothing. If the press could be relied upon, the country was entirely satisfied with the new régime, although there was a decided undercurrent of feeling that fear of British intervention dictated the policy of the King and his new Prime Minister. By this action, the proposed measures of legislation, which were so distasteful to British authorities, could be indefinitely postponed.

EGYPT, ANCIENT. See **ANTHROPOLOGY**.

EGYPTIAN ARCHÆOLOGY. See **ARCHÆOLOGY**.

EINSTEIN THEORY. See **PHYSICS; RELATIVITY**.

ELECTRICAL ENGINEERS. AMERICAN INSTITUTE OF. A national organization representing the electrical engineering profession, founded in 1884. The objects of the Institute are the advancement of the theory and practice of electrical engineering and of the allied arts and sciences, the maintenance of a high professional standing among its members, and the development of the individual engineer. It is governed by a board of directors, elected by the membership, consisting of a president, the 2 junior past presidents, 10 vice presidents, 12 directors, and a treasurer. In 1928 there were 54 sections of the Institute located in various cities throughout the country and 99 branches in colleges giving courses in electrical engineering. Three annual conventions are held, in addition to regional, local section, and branch meetings. Much of the Institute's work is accomplished through its standing and technical committees, of which there were 37 in 1928. It maintains, in cooperation with other national engineering societies, the Engineering Societies Library and a national employment service. There are three grades of members, as follows: Associate, member, and fellow; and the total membership on Oct. 1, 1928 was 18,423.

The principal publications of the Institute are the monthly *Journal*, the annual *Transactions*, the *Standards of the A. I. E. E.*, and the *Year Book*. The officers elected for 1928-29 were:

President, R. F. Schuchardt; junior past presidents, C. C. Chesney, and Bancroft Gherardi; vice presidents, O. J. Ferguson, E. R. Northmore, J. L. Beaver, A. B. Cooper, C. O. Bickelhaupt, E. B. Merriam, H. A. Kidder, W. T. Ryan, B. D. Hull, and G. E. Quinan; directors, M. M. Fowler, C. E. Stephens, E. C. Stone, I. E. Moulthrop, H. D. Don Carlos, F. J. Chesterman, F. C. Harker, E. B. Meyer, H. P. Liversidge, J. A. Johnson, A. M. MacCutcheon, and A. E. Bettis; national treasurer, George A. Hamilton; national secretary, F. L. Hutchinson. The Institute's national headquarters are in the Engineering Societies Building, 33 West 39th Street, New York, of which it is joint owner with three other national engineering societies.

ELECTRICAL INDUSTRIES. The increase in the use of electric motors in the various industries was again very marked. In the industrial factories, there was in 1928 an average of 5 h.p. of mechanical power for each worker. The steel mills led with the addition of some hundreds of thousands of horse power to supplant steam engines. The most popular set-up was one in which one or more large d.c. motors drive the rolls and are supplied by an a.c.-d.c. motor generator set with a large fly-wheel so as to take a fairly steady load from an a.c. network. In one instance a 5000-h.p. induction motor was installed and in another a 3000-h.p. synchronous motor was used to drive a constant speed mill. A novel grouping for steel mills is that in which several rolls operating simultaneously on successive portions of the same piece of metal are driven by various motors all controlled automatically to cause uniform and synchronous feeding.

The largest hoist motor yet built was that of 3200 h.p. at 79 r.p.m. operating on direct current and used by the International Nickel Company.

Some electric shovels taking 12 cubic yards of earth at one scoop were built and put into service. They are rated at 550 tons and take 800 h.p. from an a.c. supply which is converted to direct current by a motor-generator set which in turn supplies the several motors. A 15-cubic-yard shovel which would weigh 1350 tons was under construction. An electric car loader was developed, which would lift a completely loaded refrigerator car and place it in the hold of a vessel. There was to be one at Havana and one at New Orleans to care for the fruit trade.

Electric Welding continued to reach into new fields. A number of buildings were constructed by welding the steel members together instead of riveting, and a railway bridge has also been so constructed. (See **BRIDGES**.) Welding also was applied to utilizing scrap steel for useful products, such as using old rails to make ties.

The electric furnace developments were indicated by the construction of a three-phase arc furnace for steel rated at 20,000 k.v.a. with automatic electrode regulation, and supplied by a large three-phase transformer. Induction furnaces for copper and brass were quite general and the high-frequency (2000 cycles) induction furnace of the coreless type for steel had been developed up to the 150 k.v.a. size. This is of advantage in making high-grade steel to a particular formula.

The automatic leveling of elevators was being accomplished by means of radio-frequency

currents eliminating the necessity of physical contacts between elevator and floor. The ventilation of the Holland Tunnel between New York and Jersey City was an application of electric drive and electric control of no small importance. It involves supplying an enormous flow of air, carefully distributed with the greatest of precautions against failure and all controlled by one operator who has in front of him a device which indicates when the air in the tunnel becomes dangerous to life because of the gas engine exhaust.

The public utility companies of the United States produced an output of 83 billions of kilowatt-hours, an increase of 10 per cent over that of 1927 and their gross income was a little over two billion dollars or about 2.4 cents per kw.-hr. Of this energy 59 per cent was produced from fuels and 41 per cent from water power. In the coal-burning stations the average consumption of fuel was 1.7 lbs. per kw.-hr. There were 23,000,000 individual customers of the companies, an increase of 1,400,000 in 1928. More than 4000 towns and villages are served by these companies.

The use of electrical machinery on the farm was increasing and there were 350,000 farms connected and served, an increase of 125,000 in three years. Among the several organizations studying the use of electrical machinery on the farm was the University of Minnesota which had published a report covering several years of study in which it is stated that "electricity, liberally and intelligently employed, has been a very material and beneficial influence."

ELECTRIC FURNACE. See CHEMISTRY, INDUSTRIAL; IRON AND STEEL.

ELECTRIC LIGHTING. The trend toward an increased level of illumination and more artistic arrangement of luminaires was vigorously pushed, along with a programme of standardization, improved methods of manufacture, and decreasing prices of lamps. There were 319 million large-sized, and 240 million miniature-sized, incandescent lamps made during the year. Of these, 59 per cent was for 115 volts and 94 per cent was for either 110, 115, or 120 volts. The number of sizes was reduced and the majority were "inside frosted" while the colored lamps were colored on the inside of the bulbs. A 10,000-watt tungsten lamp was in commercial production and a 50,000-watt lamp was built as an experiment.

The International Illuminating Congress was held in America for the first time with the main meeting at Upper Saranac, N. Y., and with visits and conferences in many of the principal cities.

There was a great popular development in sign lighting by means of Neon tubes made in the form of long tubes twisted into the shapes of letters and figures. These operate on alternating current at fairly high voltages and may be given various colors by admixture of other gases.

The subject of motor-vehicle lighting received very careful study by the various interested organizations and at their suggestion the U. S. Bureau of Standards has made a careful investigation and recommendations including standard specifications. Uniform regulations had been adopted in twenty States.

A careful study was being made of the effect of artificial light upon animal and particularly

upon plant life, it being indicated that a more rapid growth and more productive type of plant might be cultivated by this means. The use of ultra-violet light and artificial sunlight was growing in popularity and a careful investigation was being carried on to ascertain at just what point these effects ceased to be beneficial to life and became harmful. There seemed to be an indication that a wave length of 300 millimicrons was the optimistic value and that shorter wave lengths became harmful.

Much was accomplished in the improvement of illumination of air-ports by means of beacons, boundary lights, fog piercing lights of gaseous construction, and the lighting of 12,000 miles of airways.

The photo-electric cell was improved and applied to many new uses, among others in a color analyzer which gives the amount of light in each wave length which is given out by the subject of analysis.

ELECTRIC POWER TRANSMISSION.

With the increasing length and ramification of transmission lines, protection from lightning has become of the greatest importance in maintaining reliability of service. This, therefore, was the most prominent subject of investigation and discussion in the year under record. Records were kept on a number of systems of the frequency of lightning discharges and their physical effects on the apparatus. New instruments were devised to record or picture the lightning discharge, such as the Klydonograph and the Cathode-Ray Oscillograph, both of which give quite an interesting story about an event which lasts only a few millionths of a second. The use of an overhead ground wire, of string insulators with scientifically designed "arcing-rings" and the introduction of commercial lightning arresters for 220,000 volts helped to protect the lines.

The line insulators were improved as a result of the development for testing purposes of "Lightning Generators," capable of giving an impulsive discharge at as high as 3,600,000 volts, by charging capacitors in multiple and discharging them in series. Two million one hundred thousand volts is the highest potential available for steady application. This was obtained from a transformer.

There had been an increase in the number of transmission systems using 220,000 volts, notably in New Jersey, the Conowingo project, and the Ontario Commission system. This was still the highest voltage in commercial use in the United States, but Germany had a line operating at 380,000 volts.

Interconnection of systems progressed slowly as a practical operation, mostly by tying together neighboring systems, as, for instance, three different systems in New Jersey and Pennsylvania. Of academic interest is the fact that at one time during the year a complete electrical connection was made from Chicago through to Boston, by means of the intervening companies and systems. Similarly at another time a tie was made between Chicago and Florida. These experiments are of interest in showing that all the various power stations in the system could be held in step or in synchronism with each other.

It was reported that the two installations of oil-filled underground cables for 132,000 volts, which were installed in 1927, had given successful service and that several such installa-

COMPANY AND SHOWN PARTLY INSTALLED AT THE LONG BEACH STATION

ELECTRICAL DEVELOPMENTS OF 1923

tions of oil-filled, three-conductor cables had been installed for 33,000 volts.

A 40,000-k.v.a., 29,000-volt, three-phase self-cooled transformer having an efficiency of 99.54 per cent was built by the Westinghouse Company for the United Electric Light and Power Company of New York. This was a record for size and efficiency. Three 28,866-k.v.a. single-phase transformers, for operation at 220,000 volts three-phase, were built by the General Electric Company and surpass in size any others for this high potential.

There had been a great increase in the use of transformers with load-ratio control by tap-changing with improvements in the mechanism to make it automatic and to prevent short-circuiting parts of the windings during the operation. They are made for single-phase or three-phase and it was reported that 40 per cent of the transformers of sizes of 20,000 k.v.a. and larger were built of this type.

The use of the series capacitor to neutralize the inductive drop in a transmission line was introduced during the year by the installation of three capacitors of 415 k.v.a. and 3170 volts on a 33,000-volt three-phase transmission line. This eliminates all voltage losses in the line except that due to resistance.

In distribution networks there had been a decided trend to supersede direct current and two-phase alternating current networks by a system of four-wire three-phase networks with some special developments in step-down transformers for this purpose.

In protective devices the development of "quick-break" circuit breakers of both the air-break and oil-break type has been noteworthy and has given much improved protection to the circuits and the apparatus. The endeavor to correct the power factor of systems has continued by the installation of static condensers and synchronous condensers. An example of the latter is a 30,000 k.v.a. machine at 720 r. p. m. for the Philadelphia Electric Company.

ELECTRIC RAILWAYS. Serious planning for the electrification of some of the most important trunk-line steam railways was the most interesting feature of the year 1928. The Pennsylvania continued actual work and increased the scope of its plans to include about 325 route miles extending from the Hell Gate Bridge on Long Island through New York and Philadelphia to Wilmington for southern traffic and to Atglen, Penn., 47 miles west of Philadelphia, for western traffic. \$100,000,000 was appropriated for this purpose, although it was recognized that the completed system would cost more. The Pennsylvania had chosen the single-phase system with an overhead trolley at 11,000 volts and 25 cycles. The New York Central at the end of the year announced its intention of carrying its electrification through to Buffalo, a total of 440 miles. The Central had adopted direct current at 600 volts for its New York terminal and direct current at 3000 volts for its Cleveland installation, but it had not been announced what system had been chosen for this latest proposal. The New York Central was completing the electrification of the Cleveland Union Terminal involving 17 route miles, 25 locomotives of 204 tons and 3000 h.p. each.

The Great Northern had completed the construction of its new Cascade Tunnel, $7\frac{3}{4}$ miles in length, which is operated at 11,000 volts

single phase with 260-ton electric locomotives using d. c. motors supplied from a motor-generator set. This is part of the electrified section from Wenatchee to Skykomish, 23.5 miles of heavy grade. See **TUNNELS**.

The Philadelphia & Reading announced its intention of electrifying its Philadelphia local section with 11,000-volt single-phase, multiple-unit suburban trains at a cost of \$20,000,000. The Delaware, Lackawanna & Western was at work on the electrification of its Hoboken terminal and suburban section with direct current 3000 volts using locomotives and multiple-unit trains.

A new type of car for street railways was known as the "Bus Type." It was a light-weight car with a body like a bus propelled by four automotive-type motors with double reduction gear and had a total weight of 16,000 pounds. It is one example of the endeavor to reduce the amount of dead weight on street railways and is a special example of the one-man light-weight car which continued to increase in its application.

Special attention was given to the control systems of trolley cars by which the rate of acceleration was increased to 3.5 and 4 miles per hour per second without discomfort to its passengers. This was accomplished by an ingenious method of providing more steps on the control which causes the rate of acceleration to increase gradually. This results in considerably faster schedules without increasing the maximum running speed of the cars.

The use of oil-electric locomotives and gas-electric motor cars and busses had increased and the former were supplanting the steam switchers in industrial factories. There had been a number of new installations of increased capacity of mercury-arc rectifier sub-stations for railways to take the place of synchronous converter stations. Notable among these were: the two 750-kw., 1500-volt units for the Piedmont Railway and for the Chicago South Shore & South Bend Ry.

ELLIOTT, El'z't, HOWARD. American railway executive, died at Dennis, Mass., July 8. He was born at New York, Dec. 6, 1860, and was graduated from the Lawrence Scientific School, Harvard University, as a civil engineer, in 1881. After serving in several capacities with the Chicago, Burlington and Quincy R. R., until 1887, he became general freight and passenger agent of the St. Louis, Keokuk & Northwestern Ry., a part of the Burlington system, and later he was general freight agent (1891-96) of the Missouri lines, general manager of the entire system (1896-1902), and the second vice president (1902-03). He was president of the Northern Pacific Railway Co. from 1903 to 1913, doing much to develop and extend the system and in the latter year he became president of the New York, New Haven & Hartford R. R. He resigned this office before the end of the year and became chairman of the board of directors. In 1917 he was appointed to the office of chairman of the commission on intercorporate relations of the road, retaining the office until 1922. In 1920 he was appointed chairman of the Northern Pacific Ry. He retained his connection with that system until his death. During the World War, Mr. El-

liott was a member of the special committee on national defense of the American Railway Association. He took an active interest in Harvard University, and was a member of the board of overseers, 1909-15, 1916-22, and after 1924; was president in 1925; and president of the Harvard Alumni Association. He was also a life member of the corporation of the Massachusetts Institute of Technology, and a member of many learned and patriotic societies. In 1916 he received the degree of LL.D. from Middlebury College. He was a director of a number of large railway and financial corporations.

ELLIOTT, SARAH BARNWELL. American author, died at Sewanee, Tenn., August 30, at the age of eighty. She was born at Savannah, Ga., and living in New York City part of the time, she soon made herself known by her sympathetic stories of Tennessee mountaineers. The first of these was *Jerry* (1889), which was published serially in *Scribner's Magazine*, and later translated into German, and republished in Australia. *The Durket Sperret* (1897) was another of her popular Southern tales. She also wrote *The Fellers* (1889); *An Incident and Other Happenings* (1889); *Sam Houston* (1900); *The Making of Jane* (1901); and a play, *His Majesty's Servant*, which was produced in London. She was active in the woman-suffrage movement in the South and other feminist activities.

ELLIOTT, WALTER. American Roman Catholic clergyman, died at Washington, D. C., April 18. He was born at Detroit, Mich., Jan. 6, 1842, and was educated at the Christian Brothers College and Notre Dame University. He served throughout the Civil War in the Union army, as a private in the Fifth Ohio Volunteers. In 1872 he was ordained to the priesthood in the Church of the Paulist Fathers, New York, and he devoted much of his energies thereafter to the work of building up the order. Father Elliott spent 56 years as a missionary and trainer of missionaries for his church. In 1903, with the Rev. Alexander P. Doyle, he founded the Apostolic Mission House at Washington, D. C. He lectured throughout the United States, and wrote several books. Among them were: *The Mission Sermons; Life of Christ* (translated into many modern languages); *Jesus Crucified; The Life of Isaac T. Hecker; Parish Sermons; and Spiritual Life.*

ENGLAND. The term in its strictest sense applies to the largest and most densely populated part of the Island of Great Britain. As employed in reference to the government, it often indicates the United Kingdom and Ireland. See **GREAT BRITAIN.**

ENGLAND, CHURCH OF. The Established Church of England. Its faith is represented in the United States by the Protestant Episcopal

Church (q.v.). The King is the supreme governor of the church, possessing the right to nominate to vacant archbishoprics and bishoprics. The King and the First Lord of the Treasury also appoint to certain deaneries, prebendaries, and canonries, and the Lord Chancellor to certain canonries. For administrative purposes the country is divided into two provinces: the Convocation of Canterbury and the Convocation of York, each under the control of an archbishop. The Church Assembly, established in 1920 "to deliberate on all matters concerning the Church of England and to make provisions in respect thereof," consists of three Houses, composed of bishops, clergy, and laity respectively, the laity being elected every five years by the lay members of the Diocesan Conferences, which consist of representatives elected by members of the church. Every measure passed by the Church Assembly must be submitted to an Ecclesiastical Committee, consisting of 15 members of the House of Lords and 15 members of the House of Commons. This Committee reports on each measure to Parliament, and the measure becomes a law if it is passed by both Houses of Parliament. Parochial affairs are managed by the lay members of the Diocesan Conferences.

The outstanding event of the year under review was the controversy which centred round the Prayer Book. It will probably be remembered that the Prayer Book Measure of 1927 was rejected by the House of Commons Dec. 15, 1927, by a majority of 33. The House of Bishops decided early in January to present to the Church Assembly a new Prayer Book Measure, 1928, which purported to explain clearly beyond the possibility of misconstruction the controversial proposals contained in the Deposited Book. It was introduced for final approval at a special session of the Church Assembly held April 26 and 27, when, after having passed through all its stages, it received final approval by 296 votes to 153. It then came before the House of Commons June 13 and 14, but was again rejected, by 266 votes to 220. The majority of diocesan bishops subsequently consulted their clergy in Synod and the lay members of diocesan conferences regarding the situation that was thus created. The Bishops had vested the copyright of the additions and alterations in the 1928 Prayer Book in the Central Board of Finance, and they asked that board to arrange with the privileged press for the publication of the new Prayer Book in the 1928 form with a prefatory note stating that its publication was not intended to imply that the book was authorized for use in churches. The book was, therefore, brought out and placed upon the market on Tuesday, December 4.

In addition to the special work carried out in connection with the Revised Prayer Book, three ordinary sessions of the Church Assembly were held in February, July, and November, when many matters of importance came up for discussion and decision. The *Ecclesiastical Commissioners Measure*, 1928, which extended the powers of the Ecclesiastical Commissioners so as to enable them, if they thought fit, to make grants out of their common fund, by way of additional stipend or otherwise, to elderly, unbeneficed clergymen holding curacies or doing work of a like nature, received Royal Assent July 2. The *Clergy Pensions (Amendment) Measure*, 1928, amending the principal measure by

settling points of uncertainty which arose in the interpretation and application of it, and relieving the clergy from hardships which resulted from it in certain cases, received Royal Assent August 3. The other provision receiving Royal Assent was the *Tithe (Administration of Trusts) Measure*, which improves the condition of tithe-owning clergy by providing for equal quarterly payments of tithe by arrangement between the Governors of Queen Anne's Bounty and the Ecclesiastical Commission. Advances to enable the governors to pay incumbents were provided for. (Royal Assent, August 3.)

Other proposals considered by the Assembly included: *The Cathedrals Measure*, prepared by the Cathedral Commission and introduced at the summer session, to establish a body of Cathedral commissioners with power, subject to various necessary consents, to make schemes for the better government of Cathedral and Collegiate churches. After a long debate the motion for general approval was adjourned until the autumn session when it was again considered at great length, and carried by a large majority. It was provided that the Commission should be set up for seven years only. The *Incumbents Resignation Acts (Amendment) Measure* was considered at the summer and autumn sessions when it was referred to a committee to determine whether there were other financial resources available for pensions to clergy who were outside the scope of the Clergy Pensions Measure. The *Parsonages Measure*, consolidating and amending the law relating to the sale and purchase of parsonage houses, received final approval and was before the Ecclesiastical commissioners at the end of the year. The *Marriage Measure*, providing that marriages may be solemnized in any church which is the usual place of worship of the persons to be married or of either of them, received general approval at the autumn session.

The important church events of the year included: The passage of the *Indian Church Measure* by the Church Assembly, and the *Indian Church Act* passed by Parliament, which came into operation on Jan. 1, 1928, by an Order in Council; and the consecration of the following bishops: The Rev. G. B. Allen, D.D., as Bishop Suffragan of Sherborne, and the Rev. W. G. Hardie, as Assistant Bishop of Jamaica, by the Archbishop of Canterbury in Lambeth Palace Chapel, May 6; the Venerable W. Stanton Jones, as Bishop of Sodor and Man, in York Minster by the Archbishop of York, June 11; the Rev. C. E. Curzon, as Bishop Suffragan of Stepney, in St. Paul's Cathedral October 18, by the Archbishop of Canterbury; and Canon J. B. Seaton, as Bishop of Wakefield, in York Minster by the Archbishop of York, November 1. The following Bishops resigned their Sees in addition to the Archbishop of Canterbury: The Rt. Rev. B. O. F. Heywood, D.D., from the See of Southwell owing to ill health, and the Rt. Rev. G. R. Eden, D.D., from the See of Wakefield. The following were among the principal church appointments in 1928: The Most Rev. Dr. Cosmo Gordon Lang, Archbishop of York, to be Archbishop of Canterbury in place of Dr. Randall Thomas Davidson. Dr. Lang was enthroned in Canterbury Cathedral December 4; the Rt. Rev. Dr. William Temple, Bishop of Manchester, to be Archbishop of York; the Rt. Rev. Dr. F. S. Guy Warman, Bishop of Chelms-

ford, to be Bishop of Manchester; the Rt. Rev. Henry Mosley, Bishop Suffragan of Stepney, to be Bishop of Southwell; Canon H. A. Wilson, Rector of Cheltenham, to be Bishop of Chelmsford; Canon J. B. Seaton, principal of Cuddesdon College, to be Bishop of Wakefield.

The Islington Clerical Conference, which has been held every year since 1827, took place at the Church House, Westminster, January 10; the Anglo-Catholic Congress anniversary meetings held at the Albert Hall July 5, discussed *Christian Internationalism* and were addressed by the Bishop of Manchester, Dr. P. N. Waggett, the Bishop of Colombo, the Bishop of Truro, and Sir Henry Slessor; other Anglo-Catholic congresses and conferences were held in various parts of the country, the most important being those at Norwich and Southend in October. The Church Congress took place at Cheltenham, October 2-5, under the presidency of the Bishop of Gloucester. The general subject was *The Anglican Communion: Past, Present, Future*. The membership was about 2400. At the Modern Churchmen's Conference held at Cambridge, September 17-24, the general subject was *The Christian Religion in Relation to History*.

The Convocations of Canterbury and York which met in March and July discussed such topics as *The Future of the Church of England Temperance Society; Disarmament; and Reunion in South India*. In March, the convocations met in joint session and passed a resolution that the *Prayer Book Measure, 1928*, should be laid before the National Assembly of the Church of England for final approval. The sixth and final report of the Missionary Council of the Church Assembly, *The Call to West and East*, published October 23, dealt with the Jewish people, the Oriental dispersions, the West Indies, the aboriginal peoples, and those fields not hitherto covered by the first five reports, and included a section restating the missionary task of the Church of England. The students from Oxford and Cambridge and the modern universities devoted special effort to making known the "World Call" in many towns and villages throughout England, as many as 1475 parishes being visited by 616 students, of whom 563 were men and 53 women. The meetings, both in populous centres and rural areas, were well attended and the movement met with marked success.

Dr. Randall Davidson resigned the See of Canterbury November 12, after having held the position of primate for more than 25 years. He was created a Baron of the United Kingdom. A tribute fund was opened in the summer to give all church people an opportunity of expressing to the archbishop their gratitude for the services he had rendered to the church and nation; a large number of contributions were received from all classes of people; and a gift upward of £15,000 was presented to the archbishop at Lambeth Palace on the day of his retirement.

At the July session, Lord Grey, chairman of the Central Board of Finance, presented the Church Assembly Budget for 1929. It amounted in all to £146,271, the chief items being £32,700 for religious education, £50,000 for the clergy pensions scheme, and £20,000 for training new candidates for the ministry. The bulk of this sum was apportioned to the dioceses. The contributions to the 1928 budget from all sources up to the middle of December amounted to £70,167. The amount contributed by the dioceses up

to this time showed an improvement on the previous year, in spite of the fact that unemployment and the depression in trade and industry throughout the country still continued to be acute. Church finance as a whole was not unsatisfactory, inasmuch as contributions to the larger societies and institutions were, generally speaking, up to the average. A second appeal for sponsors for ordination candidates appeared in the *Times* and elsewhere in April, as a result of which £26,500 was received and promised, making possible a financial provision for 143 candidates for ordination.

Officers of the Assembly for the year were: Chairman, the Archbishop of Canterbury; vice chairman, the Archbishop of York; treasurer, Col. Sir R. Williams, Bart.; secretary, Sir Philip W. Baker-Wilbraham, Bart.; chairman of the House of Bishops, the Archbishop of Canterbury; chairman of the House of Clergy, the Dean of Westminster; chairman of the House of Laity, the Earl of Selborne, K.G. Headquarters are at 8, Dean's Yard, Westminster, S.W. 1, London.

ENGLISH SPEAKING UNION. See **INTERNATIONALISM**.

ENTOMOLOGY, ECONOMIC. The year 1928 saw the advance into new territory of several invading pests of foreign origin and major importance, particularly the gipsy moth, European corn borer, Japanese beetle, Mexican bean beetle, and pink bollworm. The reorganization in the Federal Department of Agriculture, as provided for in the Agricultural Appropriation Act, effective on July 1, whereby the regulatory and control activities affecting plants and plant products were consolidated under the newly organized Plant Quarantine and Control Administration, was of far-reaching importance. This Administration supplanted the Federal Horticultural Board and enabled the Bureau of Entomology to devote its attention exclusively to research work, for which \$1,969,658 was appropriated, an increase of \$200,613 over the allotment for similar activities the preceding year. The new Administration received an initial allotment of \$2,971,050, an increase of \$307,820 over the preceding year.

The entomological profession sustained a loss in the death of Dr. Eugene Amandus Schwarz, America's leading coleopterist and one of its best-known and beloved members, which took place at Washington, D. C., on October 15 at the age of 84. Dr. Schwarz had been connected with the U. S. Department of Agriculture continuously since 1877.

EUROPEAN CORN BORER. The 1927 clean-up campaign resulted in a great reduction in the abundance of the corn borer and prevented commercial damage to the corn crop in 1928, although the natural spread of the insect by flight continued, particularly in Ohio and Indiana. The spread extended northward in Michigan, northward and eastward into the Connecticut River Valley in Massachusetts and the western tier of counties in Vermont and into Marshall County, West Virginia. The pest was found for the first time in the Province of New Brunswick. An act authorizing an appropriation of \$7,000,000 for a second control campaign, made with a view to reducing the natural spread of the pest, was passed by

Congress, but adjournment took place without the appropriation of the necessary funds. A report upon investigations of its life history and habits in Europe extending over a period of four years was published. The investigators found it to be generally distributed throughout Europe and practically always present in corn-growing areas, but rarely of any economic importance except in certain areas in central Europe. This control in Europe was said to be due to a complex group of agricultural, meteorological, and parasitic factors. The work of introducing parasites of the pest from Europe progressed, seven species having been recovered indicating that they are established.

The fourth annual conference of the International European Corn Borer Organization was held at Toledo, Ohio, on September 27 and 28. A memorandum regarding the effect of the clean-up and report upon the 1928 infestation survey authorized by the conference was issued in mimeographed form in connection with the report of the proceedings.

GIPSY MOTH. A heavy defoliation was caused by the gipsy moth in Maine, New Hampshire, and eastern Massachusetts, and small striped areas appeared in eastern Vermont and in a few towns in Massachusetts west of the Connecticut River, the total acreage of defoliation being larger than the preceding year. The infestation continued to increase in many areas. The condition in the barrier zone showed improvement in the northern and southern part except in the town of Wallingford, Conn., where a large woodland colony was found. The territory in the southern part of Berkshire County and in northern Connecticut developed more infestations than usual and is now the most threatening area in the zone. Several colonies were found in the New York area of the zone. The extermination work in the infested area in New Jersey was marked by continued progress, only five small colonies having been found, a decrease by seven from the preceding year.

The quarantine against towns in Quebec was withdrawn as a result of the effective eradication measures that resulted in the apparent extermination of the colony near Henrysburg, Quebec. The work with parasites was pressed with vigor, 100,000 tachinids and a few Hymenoptera having been introduced from Poland and Hungary. Over 4,600,000 parasites were reared and liberated during the year.

JAPANESE BEETLE. The Japanese beetle continued its spread, having been found as far east as New London and Hartford, Conn., and Springfield, Mass.; southward at Hagerstown, Md., Washington, D. C., and Alexandria, Va.; and westward at Lewiston and Sayre, Pa. It was found to occur generally throughout northwestern and eastern Maryland and in many places in Delaware. In the central portion of the infestation it was somewhat less prevalent than during the past half-decade. The enforcement of Federal and State quarantines to prevent the spread of the beetle was continued. In investigational work it was discovered that many varieties of nursery plants could be successfully treated with water at temperatures between 110° and 112° F. for destruction of the beetle larvæ without injury to the plant. A new formula for the preparation of an improved miscible carbon disulphide emulsion which remains homogeneous indefinitely in storage was developed and commer-

cialized. Improved methods for the manufacture of oleate coated lead arsenate on a commercial basis were worked out.

MEXICAN BEAN BEETLE. The bean beetle continued its spread and invaded new territory in both Michigan and New York, two of the leading bean producing States. The beetle was unusually abundant in the Carolinas, completely defoliating plants in some localities. It was recorded for the first time from the greater part of New Jersey and Delaware. The spread into the Coastal Plain area in New Jersey and the eastern shore of Maryland and Virginia, where there is a heavy production of green beans for both market and canning, was not expected to result in the injury that occurs in the more mountainous territory, since in the Coastal Plain area farther to the south the beetle is only sporadically a pest and is not generally of widespread importance. It was found to occur at points in Norfolk, York, and Essex counties, Ontario.

DATE SCALE ERADICATION. The promising outlook for the completion of the eradication of the *Parlatoria* date scale from the United States received a setback late in 1927, when several new infestations were discovered in California and Arizona. To meet this menace, a supplemental appropriation of \$25,000 was made available by Congress in the Deficiency Bill of December, 1927, to continue so until June 30, 1929. A complete and thorough census and inspection was commenced of the date plantings in California, Arizona, and Texas. Some 5600 date palms were given the eradication treatment consisting in defoliating and torching the trees with a gasoline torch.

PINK BOLLWORM. In the first three months of 1928 seven additional counties of western Texas were found infested following the detection of bollworms there on Dec. 21, 1927. The fact that nearly 400,000 acres of cotton were grown in these seven counties and that the new area was on the edge of the main cotton belt, cotton planting being more or less continuous eastward to the Atlantic coast, gave this infestation an importance vastly greater than the earlier infestations. In order to meet the situation and effectively combat the pest, the sum of \$687,800 was appropriated by Congress, \$200,000 of which became available early in March.

The only important change in the infested areas in southeastern Arizona and southwestern New Mexico was the finding of the pink bollworm in an isolated field in the Santa Cruz Valley of Arizona. The sum of \$90,000 included in the first Deficiency Act of 1928 became available in December, 1927, for the purpose of cleaning up the western areas. Extensive investigations of the biology of the pest were conducted both in Mexico and in Texas.

COTTON BOLL WEEVIL. Studies in Texas showed that 70 per cent of the boll weevils that are killed by calcium arsenate obtain the poison by picking the particles of dust from the surface of the leaves or stems and only 30 per cent from poison in the dust obtained by feeding on the squares and bolls. The work indicated that better control was obtained on plants having a pubescence to retain the particles of dust than on those which lack it. See also BOTANY.

THURBERGIA OR ARIZONA WEEVIL. This native variety of the boll weevil continued to increase in cultivated cotton in the Southwest and was

found more abundant throughout the infested area than ever before. It was found to be quite generally distributed in all cotton plantings south of Tucson and was also found without difficulty in the cotton plantings just north of the city. Its eradication in nature is considered hopeless, and since even partial eradication is not now feasible an attempt is being made to develop a means of reducing and holding the danger zone to a minimum as its production of weevils constitutes a menace to other areas. In the control work, 5336 tons of cottonseed were sterilized under the provision of the quarantine during the season and 10,672 bales of cotton lint and linters were compressed and then fumigated under vacuum with hydrocyanic-acid gas.

ALFALFA WEEVIL. The alfalfa weevil which spread along the Wyoming-Nebraska State line the preceding year was found at Henry in Scotts Bluff County, Nebr. This is of particular importance because of its approach to one of the great Eastern centres of alfalfa production.

SWEET POTATO WEEVIL CONTROL. In control work with the sweet potato weevil in Mississippi and Alabama, over 4500 farms were inspected, and infested farms, 12 in Mississippi and 23 in Alabama, thoroughly cleaned at harvesting. The Florida and Georgia area, in which 250 farms were found infested in 1919 and cleaned up, was released as free from weevil, none having been detected since 1924.

ORIENTAL PEACH OR FRUIT MOTH. Although not abnormally destructive throughout the greater part of its range, the peach moth was found as far north as Jackson and Williamson counties, Ill., was quite serious in Greene County, Ohio, and was recorded as far south as central Florida.

MEXICAN FRUIT WORM. The control work with this citrus pest, which appeared in grapefruit orchards in the lower Rio Grande Valley in May, 1927, appears to have been most successful. The enforcement of quarantine restrictions and drastic clean-up and eradication work has apparently prevented its reappearance in the district, and the large crop of 1927-28 was harvested without the discovery of a single infested fruit.

INSECTICIDE CONTROL OF INSECTS. In onion thrips control work in Nebraska a 1-to-500 solution of nicotine sulphate reduced the number of thrips by 75 per cent, the yield having been 18 per cent greater where control was attempted. A 1-to-800 nicotine sulphate spray killed nearly 90 per cent of the flour thrips infesting strawberry blossoms in Florida and even better results were obtained from dusting the plants with a mixture of equal parts of sulphur and finely ground tobacco analyzing 2 per cent nicotine. The latter not only killed thrips in the blossom but acted as a repellent and delayed reinfestation for several days and also controlled red spiders. De Ong pointed out that the value of petroleum oil as a spray is not confined to its insecticidal value alone but includes a potential value as a carrier for other and more active chemicals which may act as insecticides and fungicides or perform functions not now recognized. In work with scale insects in the lower Rio Grande Valley, the use of oil emulsion made with canal water proved unsafe for spraying citrus. Fumigation for the scale gave a mortality of 98 per cent, but it was found unsafe to fumigate in the spring or early summer.

MOTH-PROOFING FABRICS. A more general use of the moth-proofing of fabrics against injury

took place during the year. Experiments demonstrated that when the fabric is thoroughly impregnated with the best solutions, preferably before the goods leave the manufacturing plant, they give a moth resistance that is of practical value.

MOSQUITO TRANSMISSION OF DISEASE. In investigations conducted at Manila, P. I., dengue fever was transmitted by the yellow-fever mosquito when the interval between the infectious feed and the subsequent biting was 8 to 10 days or longer and not when the interval was 6 days or less. In investigations conducted on monkeys in Nigeria, West Africa, by the Rockefeller Foundation, the virus was transmitted through the bite of mosquitoes in one experiment on and after the ninth day and in two experiments on the twelfth day after the initial infecting feed. In transmission experiments with yellow fever in West Africa, *Aedes luteocephalus* and *A. apicoannulatus* were able to transmit yellow fever in all respects in the same manner as *A. ægypti*.

APICULTURE. Two hitherto unrecognized diseases of the honeybee were discovered during the year. The first, a new disease of the adult, was found to be caused by an organism to which the name *Bacillus apisepeticus* was given. The second, a disease of recently emerged adult bees which reached the nature of an epidemic among day-old bees, was discovered to have been caused by the fungus *Mucor hiemalis*.

BIBLIOGRAPHY. Important books of the year included, G. H. Carpenter, *The Biology of Insects* (London, 1928); H. G. Dyar, *The Mosquitoes of the Americas* (Carnegie Inst. Wash. Pub. 387, 1928); A. Forel, trans. by C. K. Ogden, *The Social World of the Ants Compared with That of Man, I, II* (London and New York, 1928, vols. 1 and 2); W. Horn and S. Schenkling, *Index Litteraturæ Entomologicæ* (Berlin-Dahlem, 1928, ser. 1, vols. 1 and 2); C. L. Metcalf and W. P. Flint, *Destructive and Useful Insects: Their Habits and Control* (New York and London, 1928); E. Meyrick, *A Revised Handbook of British Lepidoptera* (London, [1928, rev. ed.]); J. G. Needham, S. W. Frost, and B. H. Tothill, *Leaf-mining Insects* (Baltimore, 1928); F. Stellwaag, *Die Weinbauinsekten der Kulturländer* (Berlin, 1928); W. M. Wheeler, *The Social Insects, Their Origin and Evolution* (New York and London, 1928).

EPILEPSY. KETOGENOUS DIET IN ADULTS. The success of the ketogenic diet in epilepsy in children has been discussed in the YEAR BOOK for 1927 and at that time little had been said as to the results of the diet in adult epilepsy. In the *Journal of the American Medical Association* for July 14, 1928, Dr. Barborka of the Mayo Foundation takes up the latter subject. In 1922 the experiment was initiated of testing the diet in question on adult epileptics, but at first only a few patients were subjected to it. In 1924 the experiment seems to have begun on a larger scale. In all 49 adults were dieted, but 17 were not inclined to coöperate, so that only 32 cases can be quoted. Of this number seven patients have had their convulsions controlled completely, while seven others have shown improvement. Five others had their seizures controlled, but were also taking luminal, which may or may not have been a contributing factor, although control did not set in until the diet was begun. The remaining 13 pa-

tients did not benefit at all from the diet. Thus far it can only be asserted that children do better under the diet than adults, but the fact that 60 per cent of adults showed favorable results is very significant. There are several difficulties connected with this plan of feeding which may make it difficult to carry out in routine, but the intelligent and willing patient can diet himself, even if he has had but limited educational facilities.

PREVENTION. That epilepsy can be recognized before the convulsions appear and can be prevented like tuberculosis or other disease is the belief and hope of a few men of whom Dr. R. L. Dixon, head of the Michigan Farm Colony for Epileptics, is one. It is true that nothing is known of the causes and mechanisms of epileptic phenomena, but research in progress at the Farm Colony seemed to show that the disease may be recognized in its incipency and this being the case it may be possible to prevent it. The large sums of money spent on epileptics were being devoted only to custodial care and the staffs of colonies, etc. are too busy with routine to take up research; hence no advance is possible until research institutes and laboratories with special investigators to devote all of their time to the problems can be established. No State had such a programme, but the Michigan Legislature had been asked to provide one and Dr. Dixon believed that it would be forthcoming.

EPIRUS. A geographical expression applied to a territory, the northern part of which belongs to Albania and the southern part to Greece. The boundaries are indefinite. The Greek portion corresponds to the departments of Yanina and Prevesa, with populations in 1923 of 173,304 and 52,462, respectively. Northern Epirus had an estimated population of 250,000.

EPWORTH LEAGUE. See METHODIST EPISCOPAL CHURCH.

ERGOSTEROL. See FOOD AND NUTRITION under *Vitamins*; RICKETS.

ERITREA. An Italian colony in Africa. It lies on the coast of the Red Sea, extending from Cape Dumeirah and the Strait of Bab-el-Mandeb to Cape Kasar, a distance of 670 miles. Area, 45,754 square miles; population, at the census of 1921, 402,793 natives and 4251 Europeans. The seat of government is Asmara, situated 7765 feet above sea level, with a population of 14,711, of whom 2500 are Europeans. Massawah is the principal trade centre, with a population of 2275 in 1923. The natives are chiefly Coptic Christians and Mohammedans and they speak a dialect of Abyssinian in the plateau region and Arabic in the lowlands. The local trade is almost entirely confined to camels, oxen, sheep, goats, and their products. Although there is abundant grazing land, the pastoral population is largely nomadic. There is considerable trade in palm nuts, and pearl fishing is pursued at Massawah and in the Dahlak Archipelago. For the fiscal year 1927-28, the revenue and expenditure of the colony were estimated at: Colonial revenue, 42,455,000 lire; expenditure for colonial administration, 26,330,250 lire, and for military purposes, 16,125,250 lire. Governor in 1928, Dr. Jacopo Gasparini (appointed in 1923).

ERROLL, EARL OF (VICTOR ALEXANDER SERELD HAY, TWENTIETH EARL OF ERROLL). British diplomat, died at Coblenz, Germany, February 19. Born Oct. 17, 1876, he began his diplomatic

career as an attaché in 1900, becoming third secretary in 1902, second secretary in 1906, first secretary in 1913, and counselor in 1919. He was first secretary of the legation at Copenhagen in 1918-19, and chargé d'affaires at Berlin on the resumption of diplomatic relations between Great Britain and Germany in 1920, until the arrival of the ambassador. Subsequently, and until November, 1921, he was counselor of the embassy at the German capital. From 1921 until his death he was British high commissioner on the inter-allied Rhineland High Commission. Until 1927 he was known as Lord Kilmarnock, one of the minor titles of the Earldom of Erroll, in which he succeeded his father in the year named. He was the head of the historic Scottish family of Hay, and twenty-fourth hereditary lord high constable of Scotland, as well as knight marischal of that kingdom. He wrote a book, *Ferelith* (1903) and two plays, *The Dream Kiss* (1924) and *The Anonymous Letter* (1927).

ERYSIPELAS. The serum treatment of this disease which was first reported by Birkhaug of Rochester, N. Y. in 1926 was the subject of a paper by Dr. Wm. S. McCann of the same city in the *Journal of the American Medical Association*. The earliest report dealt with 60 cases in which the results as to length of sojourn in hospital were very favorable. Subsequent experience, however, was disappointing, and comparison of the new serum with ordinary scarlet fever antitoxin seems to show that the latter was equally efficacious. Analysis of the cases of erysipelas treated at the same clinic in long past years shows low mortalities and short average sojourn in hospital which had not been improved under the new serum. The author is not wholly a pessimist and defers judgment until the serum has been fully tested on types of cases which have a bad prognosis. On the other hand, Dr. Symmers of Bellevue Hospital, New York (same journal, August 25), who has tested the new serum—which actually should be called an antitoxin—in hundreds of cases was most enthusiastic as to its efficacy and pronounced it a great advance, although the injections, contrary to what one would expect, confer no immunity against future attacks. Symmers by 1928 had treated over 700 cases. The mortality was about 5 per cent for facial and 8.4 per cent for corporeal erysipelas—figures quite superior to those of pre-serum days; while sojourn in the hospital showed much curtailment.

ESTONIA. A Baltic State comprising the following portions of the former Russian Empire: The Province of Estonia, the islands of Moon Sound, the northern part of Livonia, part of the northwestern section of the district of the Pskov government, and a small portion of the Petrograd government; declared independent Feb. 24, 1918, and recognized by the League of Nations, Jan. 26, 1921. Capital, Tallinn (Reval).

AREA AND POPULATION. The total area is about 18,354 square miles; population, at the census of 1922, 1,110,538, of whom 92 per cent was Estonian, 1.5 per cent German, and 6.5 per cent Russian and other nationalities. Five-sixths of

the population are Lutheran, and the rest Greek Orthodox, Roman Catholic, etc. The population on Jan. 1, 1926 was estimated at 1,117,270. Tallinn or Reval, the capital, had a population of 127,000 in 1926. Dorpat (Tartu), the seat of the university of the same name, had about 59,000 inhabitants. Other large towns are Narva, a manufacturing town, with about 27,000, and Parnu, on the Gulf of Riga, with about 27,000.

EDUCATION. Elementary education is free and compulsory. In 1925-26 there were 1356 elementary schools in the republic. Of this number 1304 were supported by local authorities and 52 were private schools. The number of middle schools for general education, gymnasiums, etc., was 81, of which 28 were private schools. For special or professional education there are five teachers' seminaries, three navigation schools, commercial schools, agricultural schools, and industrial and art schools. For higher education there are the University of Dorpat (founded in 1632) which had 4651 students in 1926 and the Technical Institute at Tallinn, with 484 students.

PRODUCTION. Agriculture and dairy farming are the chief pursuits of the people. The total area of about 10,851,648 acres is divided as follows: Forest land, 2,220,002 acres; fields, 2,532,799 acres; meadows, 2,602,274 acres; pastures, 1,836,402 acres; untillable land, 1,632,206 acres, including a peat bog of 496,122 acres. The acreage and yield of the principal crops in 1926 were: Rye, 336,330 acres, 114,055 tons; wheat, 59,104 acres, 23,919 tons; barley, 299,932 acres, 131,474 tons; potatoes, 171,814 acres, 925,896 tons; oats, 361,999 acres, 133,106 tons. In 1927 Estonia had 628,880 head of cattle, 665,510 sheep, 348,100 pigs, 224,820 horses, and 809,670 poultry. Over 10 per cent of the population finds occupation in the various industries of the country, the most important of which are textile, paper, cement, oil-shale, forestry, timber, match, flax, and leather industries.

COMMERCE. Foreign trade during 1927 was very active and was featured by a large expansion in exports which resulted in an increased export surplus. Estonia's imports, which were 6 per cent lower in volume than in 1926, were slightly higher in value, owing to a recovery of commodity prices during the year. Imports for 1927 were valued at 9,642,524,000 marks (\$25,882,000), as against 9,556,975,000 marks (\$25,485,000) in 1926. The imports of grain and flour, fish, fish products, paper, and paper products fell off; purchases of metals, machinery, cotton, fertilizers, chemicals, etc., gained considerably. The favorable trade balance was due to increased exports of dairy products, notably butter, and of potatoes, textile products, wood, and wood manufactures. Exports registered at 16 per cent increase in volume, and the more satisfactory price and market conditions for butter and flax during the year resulted in a 10 per cent value increase over 1926. Exports were valued at 10,577,572,000 marks (\$28,348,000), as compared with 9,623,603,000 marks (\$25,663,000) in 1926. The export surplus totaled 935,048,000 marks (\$2,526,000), as against a similar balance of 66,628,000 marks (\$178,000) in 1926.

FINANCE. Considerable progress in balancing the Estonian budget and stabilizing Estonian finances had been made in recent years, especially since 1922, the first year in which statistics for receipts showed a surplus over expenditures. In each of the subsequent years also there

has been a surplus of revenues over payments. Ordinary revenues are increasing and steadily approaching the point of meeting all types of expenditure. An outstanding development has been the advance in ordinary revenue, resulting from increased collections in established tax categories and from the establishment of new taxes. The budget for 1928-29 balanced at 8,026,661,000 Estonian marks, but it was confidently expected that when all the returns were in a surplus would be shown.

Estonia's national debt on Jan. 1, 1928, totaled 110,696,000 Estonian crowns (\$29,667,000), of which 110,049,000 crowns was foreign, and 647,000 crowns internal, indebtedness. As a result of the 7 per cent loan of 1927, guaranteed by the League of Nations, the debt on Jan. 1, 1928, was about \$7,700,000 greater than on Apr. 1, 1927. As the first official statement of the total debt in the new Estonian currency (see preceding YEAR BOOK) was made as of Jan. 1, 1928 (previous statements consisting only of the individual currencies in which the debt was contracted), no exact comparison with earlier periods is possible.

COMMUNICATIONS. During 1926, 2498 vessels of 724,168 tons entered and 2453 vessels of 725,442 tons cleared the ports of the Republic. Reval is the chief port. The merchant marine consists of 63 steamers of 28,468 tons, and 305 sailing vessels of 26,393 tons. The railways of Estonia are owned and operated by the State and at the beginning of 1926 comprised 674 kilometers of main standard-gauge line and 515 kilometers of narrow-gauge line.

GOVERNMENT. According to the constitution of the Estonian Republic, passed by the Constituent Assembly on June 15, 1920, and put into force December 20 of the same year, executive power is in the hands of a State head or "State Elder" and a ministry, both chosen by and responsible to the State Assembly; legislative power, in the hands of the State Assembly of 100 members elected for three years on the basis of proportional representation and by direct, universal, and secret suffrage. The Assembly forms the government and accepts its resignation, promulgates the laws, passes the budget, decides the financial policy generally, ratifies treaties, etc. The principle of the referendum is recognized for the proposal or amendment of the laws, but not in relation to measures affecting the budget, or war, peace, or foreign affairs. State Elder in 1928, J. Tõnisson, assumed office Dec. 9, 1927.

HISTORY. On Feb. 24, 1928, Estonia celebrated the tenth anniversary of her independence. Premier Tõnisson resigned in November and was succeeded by Rej, a Socialist, whose ministry received a vote of confidence on December 5. Its members were as follows: Kalbus, Radical, Justice and Interior; Lattik, Clerical, Foreign Affairs; Juhkam, Radical, War; Cinas, Socialist, Economics; Koester, New Peasant, Transportation; Johanson, Socialist, Welfare and Education; and Soonberg, New Peasant, Agriculture. In the beginning of December a commercial treaty with Germany was signed, but it was not ratified by the end of the year.

ETHER. See PHYSICS.

ETHIOPIA (formerly ABYSSINIA). A country in West Africa between the Anglo-Egyptian Sudan and the Red Sea comprising the Provinces of Harar, Equatorial Provinces, Gondar, Jinma, Wollo, Shoa, Sellale, Edjow, Wol-

laga, Guimira, Gojan, etc. The area has been variously estimated at from 350,000 to 430,000 square miles. The former figure is probably more nearly accurate. The most recent estimate of the population places it at about 10,000,000, although the Abyssinians, properly so called, number less than 3,500,000. They are Christians of Hamitic origin. The capital is Addis Abeba, with a population of from 60,000 to 70,000, of whom about 1000 are foreigners. The other chief city, Harar, has a population of about 40,000. Domestic slavery is a recognized institution, but slave trading, by an ancient law renewed by a decree issued in June, 1923, is punishable by death. In March, 1924, an edict was issued by Ras Taffari, providing for the gradual emancipation of slaves beginning with the children born of slaves.

HISTORY. On August 2 an important treaty was signed between Ethiopia and Italy. As noted in previous YEAR BOOKS, Italy and Great Britain had cast covetous eyes on the rich natural resources of the African territory of Ethiopia. The Ethiopian Government protested to the League of Nations, whereupon both countries involved stated that they had no desire or intention to interfere with the sovereignty of the country. Great Britain's interest dealt primarily with the headwaters of the Nile. It appeared from subsequent events that Italy outmaneuvered Great Britain as far as Ethiopia was concerned. The treaty between Italy and Ethiopia was a general one of friendship and arbitration, but contained a further agreement concerning the building of railroads, etc., which are described above.

The character of Ethiopia's import trade indicates that the native people in their present stage of economic development are incapable of producing even their bare necessities. The exported products, moreover, are only those of a pastoral and crudely agricultural country. For example, much of the coffee is wild. Hides and skins are the casual by-products of animals raised primarily for food, and would be wasted for the most part if there did not happen to be a foreign demand for them. Wax is gathered from wild honeycombs and ivory is obtained from wild animals killed mainly for that valuable material. Grain, of course, is cultivated, but in a primitive manner. Other agricultural products include potatoes, beans, and other vegetables. Civet production might properly be called an industry, since it is achieved by organizing breeding farms of civet cats. Gums, such as gum arabic, gum tragacanth, and myrrh, are obtained by the usual simple process of tapping the trees of the countryside. Ethiopia cannot, therefore, be called an industrial country, except in the most strictly limited sense of the word, despite its reputation for having potentialities of such an amazing extent that it might well become one of the most productive countries in the world.

No reliable figures for exports and imports are available, but, according to a British authority, they reach £2,500,000 annually. The chief exports are surpluses of the products mentioned above and the chief imports are cotton shirtings, cotton goods, liquors, railway materials, provisions, sugar, petroleum, and salt. The principal line of trade is along the French-Ethiopian Railway, but there is a considerable caravan trade in the interior. The imports come mainly from the United States, Great Britain, France, India, Italy, and Japan. The French-Ethiopian Railway connects Djibuti in French Somaliland with Ad-

dis Abeba, a distance of about 495 miles. Over this road two trains a week are run in each direction. In 1925 the owners of the road made a sweeping increase of 30 per cent in freight rates, the rates being payable on a gold basis. It was expected that this would defeat its own purpose, because the charges became so high that they were prohibitive. For many years Ethiopia has been seeking an outlet of its own to the sea, and it was announced late in 1928 that Italy would lease to that country for 130 years a piece of land in or near the port of Assab in Eritrea where a wharf, pier, or jetty could be built. The Ethiopian Government was to have complete control of the land so leased and would collect taxes on imports and exports without interference from the Italian authorities. Italy promised to build a road suitable for motor transport from Assab to the Ethiopian frontier and Ethiopia was to continue the road to Dessie. It was hoped that ultimately the road would be extended to Addis Abeba.

The government of Abyssinia is practically feudal in character, although a shadowy form of cabinet government was introduced. In October, 1928, the Prince Regent of Ethiopia, Ras Tafari Makonnen, was crowned King, after twelve years of regency. He became Regent after the incompetent Yasu was dethroned in 1916; at the same time Zauditu, a daughter of Menelik was crowned Empress. The revolution of 1916 was probably fomented by the ecclesiastical authorities, who felt that another Moslem attack on the Christian faith of Ethiopia was about to begin. Yasu himself had become a Moslem and wished to help Turkey in the war. Reports had been rife that the Empress and the Regent had not gotten along together very well, rumors stating that the Empress was reactionary and under the control of the clergy, while Ras Tafari was a progressive and strongly in favor of Western ideas and methods.

EVANGELICAL CHURCH. A denomination formed by the Union of the Evangelical Association and the United Evangelical Church. The former was the outgrowth of a religious movement started in Pennsylvania in 1800 by the followers of Jacob Albright. In 1892 a number of ministers and members organized themselves into the separate denomination known as the United Evangelical Church. At length the growing conviction that the two churches should be reunited led to the appointment of commissions, which drew up the so-called Enabling Act. The new organization was officially established at Detroit, in 1922. At the time of merging, the Evangelical Association had 167,416 church members and the United Evangelical Church 92,001. At the end of 1928, there was a total membership of 258,214. There were 1972 itinerant preachers and 475 local preachers. Of the 27,626 received into church membership during the year, 15,764 came on profession of faith. Sunday schools numbered 2849, of which 710 were in the foreign mission fields in China, Japan, Germany, and Switzer-

land. Of the total enrollment of 372,943, China had 4070; Japan, 3717; Europe 42,774. The total amount raised by the Sunday schools was \$518,194. The Christian Endeavor Society membership was 74,467. There were 1458 Woman's Missionary Societies in the denomination, with a membership of 42,047. The total value of all property was \$39,682,707. The money raised during the year totaled \$7,040,800, an average of \$27.31 per member. The chief schools of the denomination were: North Central College and Evangelical School of Theology, Naperville, Ill.; Western Union College, Le Mars, Iowa; Albright College, Myerstown, Pa.; Schuykill College and School of Theology, Reading, Pa. Two orphanages and six old people's homes were maintained in the United States, as well as several hospitals. The church had twenty-four conferences in the United States, two in Canada, one in Japan, two in Germany, and one in Switzerland. There were two publishing houses, one in Cleveland, Ohio, and the other in Harrisburg, Pa. The Church issues two official papers, the *Evangelical Messenger*, in English, and *Christliche Botschafter*, in German. It was planned to hold the next general conference in Milwaukee, Wis., in October, 1930.

EVANGELICAL SYNOD OF NORTH AMERICA. THE. A religious communion strictly evangelical in principle as historically crystallized from the Reformation of the sixteenth century and as embodied in the Reformed and Lutheran doctrinal statements, accepting these statements as far as they agree. When they disagree, however, the Evangelical Synod adheres strictly to the passages of Holy Scripture bearing on the subject and avails itself of the liberty of conscience prevailing in the Evangelical Church. The communion was organized in 1840 at Gravois Settlement, Missouri, and consolidated in 1877 with similar communions. The church is organized in 19 districts with extensive power of self-government. Presidents of districts, clerical delegates, and lay delegates meet in General Conference every fourth year. A quadrennial Conference was held in 1925 and an Extraordinary General Conference adopting a new constitution in 1927, when the organization included 1197 pastors, 1267 congregations with 350,156 communicant members, and 1250 Sunday schools with 190,261 members. Money raised by the denomination for all purposes in 1927 amounted to \$6,702,967. Church property was valued at \$38,463,860. Missionary work was carried on in the United States, India, and Honduras. In the United States there were over 100 missionaries, men and women, active in about 135 communities. The Board of Foreign Missions reported an income of over \$171,522 for 1927 and had 14 men, two of them medical workers, and 18 women, as missionaries in India, in addition to 333 native workers. In Honduras there were 11 missionaries at two stations. The denomination maintains four institutions of learning: Eden Theological Seminary, St. Louis, Mo.; Elmhurst College, Elmhurst, Ill.; Robinson Academy, Waco, Texas; and Oakwood Institute, Cincinnati, Ohio. The chief periodicals published are *Der Friedensbote*, *The Evangelical Herald*, and *The Light Bearer*.

EVERSLEY, FIRST BARON, OF OLD FORD (GEORGE JOHN SHAW-LEFEVRE). English lawyer and statesman, died at Winchester, England, April 19. He was born June 12, 1831. He was educated at Eton and at Trinity College, Cambridge, and was called to the bar in 1855. He was

a member of Parliament for Reading from 1863 until 1885 and then for ten years represented Central Bradford. In 1868 he carried through the vote in the House of Commons for arbitration of the Alabama Claims of the United States against the British Government. He was secretary of the Board of Trade under John Bright (1869-71), under secretary in the Home Office (1871), and postmaster general (1883-84). In 1881-83 he was first commissioner of works, and this office he held again in 1892-93, with a seat in Gladstone's cabinet. Then for about a year he served as president of the local government board. While in the House of Commons he was chairman of many important committees and commissions. From 1897 he was a member of the London County Council, and in 1906 he was raised to the peerage as the first Baron Eversley of Old Ford. He wrote: *Freedom of Land* (1880); *English and Irish Land Question* (1881); *Peel and O'Connell* (1887); *Incidents of Coercion* (1888); *Agrarian Tenures* (1893); *Commons, Forests, and Footpaths* (rev. ed., 1910); *Gladstone and Ireland* (1912); *The Partitions of Poland* (1915); *The Turkish Empire, Its Growth and Decay* (1917).

EXPLORATION. Modern exploration has two phases; that which is concerned with the reconnaissance of hitherto unknown areas and that which deals with detailed studies in known regions. In 1928, the majority of the expeditions were of the second type. The following list of expeditions is far from complete since it covers only the more general and more significant researches of the year. Archaeological and Anthropological investigations are described under their separate headings and expeditions in the Polar Regions are treated under POLAR RESEARCH.

NORTH AMERICA. Professor Jaggar led a seismological expedition to the Aleutian Islands (see GEOGRAPHIC SOCIETY, NATIONAL). S. R. Capps continued his mapping activities in south central Alaska. Captain Perfilieff made a study of wild life and northern scenery in northern Canada for the Academy of Natural Sciences of Philadelphia. W. B. Hoare took a census of wild life in the Great Slave Lake area for the Government of the Northwest Territories. Ice-breakers, freighters, and planes completed an 18-month survey of the practicability of Hudson Bay and Strait as an outlet for the new grain railway to Churchill. S. H. Chubb of the American Museum of Natural History made a photographic study of the bird life on Bonaventure Island in the Gulf of St. Lawrence. There was considerable activity by government geologists in prospecting for and checking new mineral fields, particularly in Ontario and Quebec. The Austin Ornithological Expedition had a successful summer in Labrador collecting and banding birds. In the United States, field work was largely archaeological or geological. In geology the State surveys, the United States Geological Survey, and the colleges provided most of the

investigators. Archaeological discoveries were particularly intensive in the southwestern States.

CENTRAL AMERICA. Here, there was a continuation of the extensive study of the archaeology not only of Mexico and Yucatan but of the entire region as well. The Yale School of Forestry, the New York Botanical Garden, the Field Museum, and the United Fruit Co. were coöperating in a study of forest conditions throughout the area. Paul G. Standley of the Smithsonian Institution made botanical studies in Honduras and Dr. and Mrs. N. L. Britton continued the botanical survey of Porto Rico which the New York Academy of Sciences had been conducting. A research station on Barro Colorado Island in Gatun Lake which was sponsored by the National Research Council was the scene of ornithological work by Frank Chapman of the American Museum of Natural History and of botanical work under L. A. Kenoyer. In the West Indies, and particularly in the Bahamas, studies on sedimentation were carried out by Dr. Flint of Princeton, Dr. Fish of the Rochester Museum, and William Beebe. Dr. Meinesz continued his study of world gravity in a submarine in the Caribbean and the Gulf of Mexico.

SOUTH AMERICA. The Dickey-Pathé Ethnological Expedition to the border regions of Brazil and Venezuela returned in the spring after a successful visit to some unknown tribes. Dr. and Mrs. Dickey again set out under the auspices of the Museum of the American Indian to study the Piarroas Indians on the Orinoco. E. G. Holt collected birds in Venezuela for the Carnegie Institution of Washington and also for the National Geographic Society. Under the auspices of the American Museum of Natural History, Mr. Tate led the Taylor Duida Ethnological Expedition to Venezuela and the Lee Garnett Day Expedition collected birds and mammals on Mt. Roraima. In Dutch Guiana, Drs. Kahn and Herskovits and Myron Granger made a survey of the Bush Negro—Dinka—for the American Museum of Natural History. J. H. Sinclair returned from mapping in Ecuador, and O. M. Miller completed a survey of the headwaters of the Marañon River—both expeditions being under the American Geographical Society.

The Geographic Society of Paris and the Paris Museum of Natural History organized an expedition which was to spend two years in the interior of Peru. In Matto Grosso, G. M. Dyott conducted a search for Colonel Fawcett, an English explorer whose long absence had aroused apprehension. No trace of him was found and the conclusion was that he had been killed by the natives. A group of German and Austrian Alpinists headed by Drs. Pfann and Troll had been climbing in the Andes. An Italian expedition from Geneva under Professor Battelli was studying the ethnology, flora, and fauna of the Amazon Basin. The Paris Canoe Club, the Geographic Society of Paris and the Natural History Museum of Paris were sponsoring an expedition up the Amazon River by canoe.

AFRICA. Exploration in the Sahara was actively pursued by the French military missions who were accomplishing much valuable reconnaissance work. The Augieras-Draper Expedition from the Paris Geographical Society had been two years in the Sahara. Seven members of the faculty of the University of Algiers made an intensive study of the Hoggar. The Wulsin-Putnam Expedition from the Peabody Museum

enquired into the ethnology of the western Sahara. In North Africa, the French National Museum sent M. Thomas to study the Troglodytes of Tunisia; Dr. Borchardt pursued his search for the "Lost Atlantis"; and Dr. Collie of the Logan Museum at Beloit sought for traces of ancient man in Algeria. In West Africa, Lady Dorothy Mills had undertaken a study of witchcraft practices. The Harold White-John Coats Abyssinian Expedition of the Field Museum was also active. The Duke of Abruzzi has reported the discovery of the source of the Webi Shebeli (River) in Italian Somaliland.

In East Africa, L. S. Leaky led an ethnological expedition for the British Museum. Two experts from the U. S. Department of Agriculture collected forage plants. For the American Museum of Natural History, the Carlisle-Clark Expedition gathered material for animal groups and Rockefeller and Murphy collected birds in Tanganyika and the Belgian Congo. Martin Johnson continued filming East African wild life. The Chicago Geographic Society sponsored an expedition to Mt. Ruwenzori under Carveth Wells. In Central and South Africa, Professor Cooley of Montana sought a parasite for the American wood tick. An aerial survey of the headwaters of the Zambezi River was in process of completion. Professor Frobenius began a survey of South African archaeology. From Denver, the Cameron-Cadle Expedition to the Kalahari commenced the search for stone-age man.

ASIA. Asia Minor was the scene of a great number of archaeological investigations. F. G. Clapp made a geological trip to Persia. M. J. Barthoux has been to Afghanistan and Sir Aurel Stein continued his travels in Central Asia and Baluchistan. The Roerich Expedition of 1927-28 which traveled through northern India, Turkestan, and central Asia collected literature and made paintings of the country. The Duke of Spoleto headed an Italian expedition seeking a new Karakorum pass into Turkestan. The German-Russian Expedition to the Pamirs has mapped much unknown country. V. N. Borovik headed a folklore expedition of the Russian State Academy of Art to the Ural-Altai country. Under Sten Bergman a Swedish group has been studying the geology and ethnology of northwest Siberia. Prof. Kulik led a Soviet expedition to the site of the world's largest meteor in northeast Siberia. In Mongolia, R. C. Andrews completed another successful collecting expedition for the American Museum of Natural History. George Cressy of Shanghai College was also doing paleontological work in Mongolia. Kosloff was investigating the headwaters of the Yangtze-kiang River. Sven Hedin returned from an expedition to the Gobi Desert and immediately started back. Dr. Trinkler of the Bremen Museum was investigating a buried city in Chinese Turkestan.

The Filchner Expedition which had started to complete the Russo-Chinese magnetic surveys and which had been given up as lost, returned from Lhasa after many narrow escapes. The Roosevelts commenced an expedition to northern Siam and China to collect big game for the Field Museum. They were to be joined by another collecting group from the same museum. J. Rock returned from a stay among the Lamas of Choni in northwestern China. In Kwang Si, Dr. Li has acted as collector for the Smithsonian Institution and the Freer Gallery in connection

with an extensive Chinese Expedition. The Fauntleroy-Vernay Expedition from the American Museum of Natural History gathered mammals in India and Burma. A German archaeological expedition under Dr. Eickstedt was making extensive studies both in India and the Andaman Islands.

AUSTRALIA. Mr. and Mrs. Blanchard of the University of Michigan were making a survey of the fauna and flora of Australasia. The Rockefeller Foundation coöperated with the University of Adelaide in an ethnological survey of Australia. Dr. Basedow explored the Northern Territory. The Great Barrier Reef Expedition made a thorough study of this most extensive coral formation with a view to determining its economic importance.

OCEANIA. The Whitney Expedition to the South Seas collected for the American Museum of Natural History. The German Sunda Expedition under Rensch and Mertens made an archaeological survey of the Malay Archipelago. Ex-Governor Pinchot was carrying two scientists with him on his South Seas cruise. The Crane-Field Museum Expedition was collecting fishes. The Netherlands Meteorological Institute conducted a vulcanological survey of Oceania. Representatives of the U. S. Department of Agriculture sought a disease-resistant sugar cane in New Guinea. Lee Crandall of the New York Zoological Gardens collected birds in New Guinea. Dr. Crampton of the Carnegie Institution of Washington was studying the evolution of land organisms in the Pacific Islands.

OCEANS. The non-magnetic yacht, *Carnegie*, of the Carnegie Institution of Washington commenced another voyage around the world. The Danish ship, *Dana*, was pursuing oceanographic studies on a world cruise. Professor Schmidt studied the relation between eels in the Atlantic and Pacific oceans. A group of Yale students collected birds and fish for the Peabody Museum. The 1928-29 world cruise of the Vanderbilts is for the purpose of collecting sea life. O. Holte-dahl, attached to the *Norvegia* Expedition, made extensive studies on the islands to the north of Graham Land in the Antarctic.

EXPLOSIVES. See CHEMISTRY, INDUSTRIAL; MILITARY PROGRESS.

EXPOSITIONS. No international exposition of importance was held during the year, neither in the United States nor Europe.

IBERO-AMERICAN EXPOSITION. A full description of this exposition planned to be held at Seville, Spain, will be found in the YEAR BOOK for 1927 (p. 280), where it was announced that the opening would occur Oct. 12, 1928. Early in the year it was found that owing to the impossibility of completing certain national pavilions in course of erection by American governments, the opening was again postponed until Mar. 15, 1929. Argentina, Brazil, Bolivia, Chile, Colombia, Cuba, Ecuador, Mexico, Paraguay, Peru, United States, and Uruguay were among the American nations that were erecting permanent buildings. There were to be three buildings, the designs for which were made by William T. Johnson of San Diego, Calif., erected by the United States, the principal one of which in the Spanish Colonial style of architecture was to be permanent, and at the close of the Exposition was to become the U. S. Consulate in Seville. Announcement was made that one of the attractions would be a replica of Columbus' famous caravel, *Santa*

Maria, which was to be constructed. A voyage will be made from Cadiz to Seville in the caravel when the officers and crew will wear exact reproductions of the dress worn at the time when Columbus set out on his trip across the Atlantic. Also the commands will be shouted in the language of the epoch. As American commissioner, Thomas E. Campbell of Arizona was appointed.

BARCELONA INTERNATIONAL EXPOSITION. A second exposition was announced by Spain for 1929, which was to be held in Barcelona from May 1 to December 31. The site chosen for this exposition is the Montjuich Park on the outskirts of the city. It was to cover nearly 300 acres and include some beautiful gardens. The structures comprised 4 permanent buildings, the National Palace, the Palace of Building Arts, the Palace of Temporary Exhibits, the Press Building, and a stadium for athletic events; also 11 temporary buildings, of which 8—the Palaces of Agriculture, Textile and Allied Industries, Electricity and Motive Power, the Theatre, Labor, Sports Equipment, Modern Arts, and Graphic Arts—were entirely or nearly completed at the end of the year. The exhibition was to have three main divisions—industrial and commercial, artistic and historical, and athletic and sporting. The Industrial Division would include exhibits of the industrial and agricultural products of all countries, together with the works of the sciences and social organizations having a direct connection with those industries. These exhibits were to be classified as (1) Motive power, machinery, and equipment; (2) Machines, tools, equipment, and supplies; (3) Organization of labor, professional direction, hygiene, and safety; (4) Agriculture and livestock; (5) Mining; (6) Textile and allied industries; (7) Building and construction, city planning, and public works; (8) Industrial arts; (9) Engraving and printing; (10) Scientific and artistic instruments; (11) Communications and transportation; and (12) Chemical industries.

Particular attention was to be given to all things pertaining to light, such as electric lighting, light and power equipment and apparatus, by-products and sources, and the influence of light on industrial and human activity. The Division of Art and History was to stress Spain, showing its development from earliest history to the present, with the influence and results of foreign contact on the Spanish race and culture clearly indicated as told in historic treasures belonging to the State, the Church, public associations, and private citizens. Life in typical Spain and an exhibition of contemporary art was to be included. The Athletic Division would embody all types of games and sports including apparatus, accessories, and costumes. One of the features was to be the national and international sports events scheduled to take place during the life of the exposition.

FUTURE EXPOSITIONS: CHICAGO. Definite plans were progressing toward the organization of a World's Fair to celebrate the centennial of the founding of Chicago in 1833. It was expected that at least \$30,000,000 would be required to finance the undertaking and it was proposed to underwrite the cost by selling certificates entitling purchasers to 10 admissions. It was recommended to build five islands in Lake Michigan on which permanent fair buildings could be constructed for the exhibit. One island would be in the shape of the United States and another

island would depict Chicago as it was in 1833. It was suggested that the various State buildings be placed in their respective positions on the "United States Island."

One of the new and unique features announced for this exposition was a historic development of the dance under Adolph Bohm to include art, folk, and stage dancing. Announcement also was made that a great parliament of religions, to be attended by clergymen and lay workers from all parts of the world, would be a feature of the part that churches would play in the Chicago World's Fair Centennial Celebration to be held in 1933. Rufus C. Dawes was the president of the World's Fair Committee; Charles S. Peterson, vice president; George Woodruff, treasurer; the secretary was Daniel H. Burnham, originator of the Chicago Plan, and the board of directors comprised sixty of the city's business leaders, including D. F. Kelly, Edwin N. Hurley, B. E. Sunny, and Samuel Insull.

NEW YORK. Plans for an international exposition of arts, industries, manufactures, and products of the soil, mine, and sea and to celebrate the 200th anniversary of the birth of George Washington had progressed to the formation of an organizing committee with Joseph P. Brown as secretary, and executive offices at 154 Nassau Street. The proposed site comprised 2000 acres of city-owned land at the extreme south end of Flatlands on Jamaica Bay, and the purpose was to make a permanent marine park as well as to afford a permanent exposition for all nations. It was indicated that the site would be ideal for an airport. The plan involves the completion of the digging of a 30-foot channel by the Government in front of the proposed site to permit largest vessels and navies of the world to anchor off the exposition grounds. Construction of buildings with exhibition space for the display of goods manufactured in the United States was expected to total approximately 5,000,000 square feet of space, exclusive of special buildings built by trades and manufactures for their own products. There was to be the largest amusement park in the world including bathing pavilion. Pavilions for exhibits by United States Government departments, as well as pavilions for 46 foreign governments, and Porto Rico, Alaska, the Philippines and Hawaii, also were planned and a stadium to accommodate 200,000 people, the largest in the world. A large tower with 200 arc lights which will flood the sky with light for a radius of many miles was another feature. Parking space for 100,000 automobiles; a one-mile water course for regattas, swimming races, and all kinds of water sports; four miles of bathing beach, considered as fine as any beach adjacent to New York City, were also contemplated. The estimated cost of constructing and laying out of the exposition, including the foreign and State pavilions, was placed at approximately \$100,000,000. In August, the Hon. Grover Whalen was elected chairman of the organizing committee.

BELGIUM. No detailed information had been received beyond the fact that in 1930 Belgium plans to commemorate the hundredth anniversary of its independence as a nation by an international exposition held jointly at Antwerp, Liège, and Brussels. The Antwerp exposition was to be devoted to the colonies, shipping, transport as applied to commerce, and the Flemish art to 1830. The exposition at Liège was to be confined to the iron and steel industries and to the sciences,

while at Brussels an exhibition of Belgian art from 1830 would be held.

POLAND. Poland's celebration in 1929 of the tenth anniversary of its restoration of independence was to include a national exposition on a large scale. It was to be held in Posen between May and October. The exposition was to occupy 32 pavilions, divided into four main sections, including cultural and artistic, agricultural and industrial, social hygiene, physical education and sports, and emigration. A fund of \$2,000,000 was being raised for the purpose.

SYDNEY. It was proposed to hold an exhibition in Sydney, Australia, from May to November, 1931. A site which lies in the northeastern part of Centennial Park, a large public recreation ground at Sydney, was selected, and was to be in the hands of the commission of control created to carry out the plans. The exhibition was to be strictly Australian in character, but participation was to be on an Empire-wide scale.

TRADE FAIRS. Lyons. The usual spring fair was held in Lyons, France, during March 5-18, and the results showed that the 1928 fair was successful from nearly all points of view and that it marked progress over the fair of 1927. According to the statistics, more than 360,000 visitors entered the main building. The number of foreign buyers was 12 per cent greater than a year before. The total number of exhibitors increased slightly to 3362, and more than 1000 requests for stands were refused because of the lack of space. Foreign countries having the largest numbers of exhibitors were: Germany, United States, Switzerland, England, Belgium, and Italy. Japan for the first time took an official part in the fair, more than 100 exhibitors participating in the group organized by the Japanese. The principal American products shown included machine tools, textile machinery, time-recording apparatus, electrical tractors, shoe manufacturing and repairing machinery, automobiles, agricultural tractors, and harvesting and cultivating apparatus. The general volume of business was 30 per cent higher. The groups registering the best sales results were metal manufactures, particularly elevators, machine tools, motors, textile, and printing machinery; furs and skins; furniture, and foodstuffs. There were good sales of electrical apparatus, hosiery, toys, and ceramics, but other groups were generally less successful.

Leipzig. The usual spring fair was held in Leipzig during March 4-14. More than 10,000 exhibits were made of which fifty represented American firms as compared with eight in 1927. Much interest was shown in the textile branch of this year's spring fair. A total of 930 textile firms exhibited as compared with 813 in the spring and 891 in the autumn fair of 1927. The international aspect was reflected by a greater number of foreign exhibitors and buyers. England was the chief foreign exhibitor, showing particularly wool knit goods and hosiery. The Japanese exhibits of silk kimonos, pajamas, shirts, and similar articles, although quite popular, were considered too bright-colored. The exhibit of furs at the Russian building was well attended and some beautiful pelts were shown. The turnover of toys, glassware, and porcelain was satisfactory, showing an increased demand for German goods.

The autumn fair was held during August 26-September 1. Reports show that there were about 10,000 exhibits from 18 countries on display

for buyers from both hemispheres, and that there was promise that the million marks' worth of trade done at the spring fair, half of which was export, would be exceeded by the autumn fair. A feature of the fair was the prominence given all branches of house building and home equipment in expectation of a home-building boom in 1929, expected because of the excellent crops this year. Textiles, toys, and chinaware were among other features of the show.

According to *Commerce Reports* (November 19, p. 483), "Porcelain in every home" was the slogan of the porcelain trades at the Leipzig Fall Fair. In order to stimulate public interest in porcelain, a tower was built on the market place in the centre of the city employing over 12,000 teacups. A large Christmas tree near the tower decorated with ornamental stars made from porcelain was likewise intended to attract the public.

According to the reports from the great Russian fair held in Nijni-Novgorod during August, business which started slowly this year was enlivened by the arrival of a large number of Persian traders and the exchange registered 600 transactions for a total of 44,000,000 rubles, a larger turnover than last year. Nine hundred firms were represented, two-thirds of which were wholesalers. About 400 of these were state or co-operative, eight concessionaires or mixed companies, 109 private; and 100 foreign. The foreign concerns were chiefly Persian, with a few Chinese and Mongolian. A feature of this year's fair was an All-Union exposition of handicraft from 42 producing regions of Russia.

EXTENSION WORK. See AGRICULTURAL EXTENSION WORK.

EXTENSION WORK IN AGRICULTURE. See AGRICULTURAL EXTENSION WORK.

EYRE, AR, LINCOLN. American newspaper correspondent, died at Berlin, September 10. He was born at Philadelphia, Pa., June 4, 1889, and after being graduated from the Taft School, Watertown, Conn., he traveled in Europe for a year before starting as a reporter on the New York Press. He was working for the New York Tribune in London when the World War started in 1914, and he then secured a place as war correspondent for the *World*, being under fire in the Western front much of the time. After covering the Peace Conference for the *World* in 1918, he transferred to the New York Herald, becoming a popular correspondent in Berlin. When the *Herald* and the *Tribune* were merged in 1923, Mr. Eyre, who was in close touch with the German Foreign Office, remained in Berlin, but changed to the staff of the New York Sun, and two years later joined the New York Times.

FAILURES. See BANKS AND BANKING; BUSINESS REVIEW; FINANCIAL REVIEW.

FAIRS. See EXPOSITIONS.

FALCON ISLAND. Located in the southwestern part of the Tonga or Friendly Islands in the South Pacific (Lat. 20° 19' S.; Long. 175° 25' W.) this island had appeared for the third known time. The eruption of October, 1927, caused the emergence of a volcanic crater which, in May, 1928, had a maximum diameter of about two miles and a height of 365 feet. Named for H.M.S. *Falcon*, which visited the spot in 1865 and reported a shoal, the island had attained an elevation of 290 feet by 1885. So quickly did it disintegrate that by 1898 it had practically disappeared. Two years later it was 10

feet high, but in 1913 a shoal was again reported. The eruption of 1927 was the most violent one on record. Explanation lies in the fact that this island is the top of an active volcano which, at times, erupts large quantities of easily eroded lava and pumice.

FAULKLAND ISLANDS. A colony of the British Crown, situated in the South Atlantic, 300 miles east of Magellan's Strait, consisting of: East Falkland, 2580 square miles; West Falkland, 2038 square miles; including in each case various adjacent small islands, about 100 in number. In addition to these are South Georgia, with an estimated area of 1000 square miles, and other dependencies including the South Shetlands, the South Orkneys, the Sandwich group, and Graham's Land, together with all unknown seas and lands of the Antarctic Ocean extending as far as the South Pole. The estimated population in 1926 was 2271. In 1926 the birth rate was 25.98 per thousand and the death rate, 14.09. The chief town is Stanley, with 950 inhabitants in 1926. Education is compulsory. Sheep raising is the chief industry, although whaling is carried on with some success. In 1926 the imports were valued at £709,246 and the exports at £4,400,701. The chief imports were groceries, coal and coke, hardware and machinery; the chief exports, wool and whale produce. The revenue in 1926 was £281,357 and the expenditure, £156,054. Governor in 1928, Arnold W. Hodson.

FAYOLLE, fā'ō'lē, MARIE EMILE. French general, died August 27, at Paris. He was born at Puy on May 14, 1852. He was educated at the École Polytechnique, where he specialized in artillery. Entering the army he advanced in rank until he had become brigadier general in 1910. At the opening of the World War in 1914, he had retired, but he was recalled to service, and put in command of the artillery brigade of Vincennes. Later in the year he was made commander of the Seventieth Division of Infantry. Early in 1915 he led the thirty-third Army Corps, and he fought at the head of the sixth French Army during the summer of that year. From February until July, 1916, he supported Pétain, who was then in charge of the armies at Verdun. Marshal Fayolle was also in active command in the Valley of the Somme between July, 1916, and March, 1917, and he was sent to Italy as commander of the French forces in the following November. He was made commander-in-chief of the allied armies including two American divisions between Soissons and the Château Thierry July, 1918, and directed the second battle of the Marne on the 18th of that month which broke Germany's military strength, and

precipitated the final defeat. After the Armistice Marshal Fayolle served from the autumn of 1919 until the autumn of 1920 as head of the commission on the German evacuation. He came to America in 1921, as a representative of General Foch, at the American Legion convention.

FEDERAL-AID ROADS. See ROADS AND PAVEMENTS.

FEDERAL CAPITAL TERRITORY. A territory of the Commonwealth of Australia, lying within the State of New South Wales. Area 940 square miles; population according to the census of 1921, 2572; estimated June 30, 1927, 7535. The bulk of the territory was acquired by the Commonwealth from New South Wales in 1911, as the site of the new capital, Canberra; 28 additional miles were obtained in 1917 as the site for a naval college. See AUSTRALIA.

FEDERAL COUNCIL OF THE CHURCHES OF CHRIST IN AMERICA. An organization established in 1908 by 28 Protestant denominations to act for them in matters of common interest. At the end of 1928 it included most of the Protestant denominations of the United States, as follows: Baptist Churches, North; National Baptist Convention; Free Baptist Churches; Christian Church; Churches of God in North America (General Eldership); Congregational Churches; Disciples of Christ; Evangelical Church; Evangelical Synod of North America; Friends; Methodist Episcopal Church; Methodist Episcopal Church, South; African Methodist Episcopal Church; African Methodist Episcopal Zion Church; Colored Methodist Episcopal Church in America; Methodist Protestant Church; Moravian Church; Presbyterian Church in the United States of America; Presbyterian Church in the United States (South); Primitive Methodist Church; National Council of the Protestant Episcopal Church; Reformed Church in America; Reformed Church in the United States; Reformed Episcopal Church; Seventh-Day Baptist Churches; United Brethren Church; United Presbyterian Church; United Lutheran Church (Consultative Body). Of these, all were full and official members with the exception of the United Lutheran Church, whose relationship was consultative, and the Protestant Episcopal Church, whose National Council coöperates in certain specified areas of work. The total number of local churches included in the constituency of the Federal Council, according to the Federal Census of the United States Government in 1926, was 136,076; number of clergymen, 116,644; total communicant membership, 22,010,312.

The Council, made up of members designated by the several denominations to act for them, meets quadrennially, the last meeting having been held at Rochester, N. Y., Dec. 5-11, 1928. It has an executive committee of about 100, meeting annually. An administrative committee, including at least one official representative from each of the denominations, meets monthly in New York. This committee includes representatives of other coöperative agencies carrying on specialized work for the churches, among them being the Home Missions Council; the Council of Women for Home Missions; the Council of the Church Boards of Education; the American Bible Society; the Student Volunteer Movement for Foreign Missions; and the International Council of Religious Education. The Council also serves as a connecting link between the church and great social agencies, such as the American Red

Cross, the Child Welfare Movement, and the U. S. Bureau of Public Health.

Special tasks of the Council are carried on by a group of commissions. The Commission on Evangelism develops a united approach to the evangelistic work of the churches. The Commission on the Church and Social Service is the centre through which the churches deal unitedly with social issues. It gives particular attention to the developing of better relations in industry through conferences. The Department of Research and Education issues a weekly information service discussing contemporary social questions from the standpoint of Christianity and makes special studies from time to time, its outstanding studies in 1928 being a report on the bituminous coal situation, and a study of the rural-urban conflict in the milk industry around Chicago. The Commission on Church and Race Relations furthers efforts of churches in promoting coöperation and good will between the white and Negro races in the United States. The Commission on International Justice and Good Will endeavors to mobilize the Christian forces to abolish war by building up effective international agencies for coöperation. During 1928 attention was given to supporting the proposal for renouncing war as an instrument of national policy. Other Commissions of the Council deal with the following subjects: Christian Education; Relations with Religious Bodies in Europe; Religious Work in the Canal Zone; Army and Navy Chaplains; Relations with the Eastern Churches.

One of the significant recent developments of 1927 was the initiation of the Church and Drama Association, organized for developing the coöperation of all religious forces in support of the worthiest productions on stage and screen.

The programme of the Council is carried on with funds contributed in part by individuals interested in the work and in part by appropriations from the various denominations. The official organ of the Council is the *Federal Council Bulletin*, issued monthly and furnishing general religious news. The officers elected for 1928-32 were: President, Bishop Francis J. McConnell, Pittsburgh, Pa.; Chairman of Executive Committee, Bishop John M. Moore of Dallas; Chairman of Washington Committee, Bishop William F. McDowell; Chairman of Western Committee, Dean Shailer Mathews. National offices are at 105 East 22d Street, New York. There is a Washington office in the Woodward Building, and a Western office at 77 West Washington Street, Chicago. General Secretaries at the national offices are the Rev. Charles S. Macfarland, the Rev. John M. Moore, and the Rev. Samuel McCrea Cavert.

FEDERAL RESERVE BANKS. See BANKS AND BANKING; FINANCIAL REVIEW.

FEDERATED MALAY STATES. A group of states, constituting a large part of the Malay Peninsula, under the protection of Great Britain, comprising: Perak, with an area of 7800 square miles; population in 1921, 590,055; capital, Taiping; Selangor, 3156 square miles; population, 1921, 401,009; capital, Kuala Lumpur, the largest city in the federation with a population of 80,000; Negri Sembilan, 2550 square miles; population, 1921, 178,762; capital, Seremban; Pahang, 14,000 square miles; population, 1921, 146,064; capital, Kuala Lipis. The total area is 27,506 square miles; with a population in 1921, of 1,324,890, comprising 510,821

Malays, 494,548 Chinese, 305,219 natives of India, 5686 Europeans, and 3204 Eurasians. The males greatly outnumber the females (853,528 to 471,362), which is due to the large number of Chinese and Indian immigrants. The estimated population in June, 1926, was 1,476,032. The movement of population in 1924 was: Births, 39,512; deaths, 33,585. In 1926 there were 46 English schools, with an average enrollment of 11,809 boys and 2946 girls. Vernacular schools under the control of the educational department numbered 1076 with an average enrollment of 56,087. There are in addition many vernacular schools for the Chinese not maintained by the Government.

Among the staple products are rice, coconuts, rubber, sugar, tapioca, pepper, gambier, and nipa palms. The main industries are the raising of rubber and the mining of tin. In addition to valuable timber, the forests produce resins, canes, gutta-percha, etc. Besides tin, gold is mined extensively; other minerals found but not worked in quantities are lead, iron, copper, manganese, silver, zinc, plumbago, mercury, arsenic, and scheelite. The labor force engaged in mining at the end of 1926 was 110,293. The imports in 1926 totaled £19,861,136 and the exports £51,937,399. The chief imports were rice, opium, tobacco, cigars, cigarettes, cotton piece goods, petroleum, and machinery; the chief exports, rubber, copra, and tin. In 1927 the rubber exports totaled 371,322 tons.

The revenue of the States in 1926 was £11,963,163 and the expenditure £10,227,437. The public debt on Dec. 31, 1926 was £9,355,000. All railroads in the Malay Peninsula south of Siam are operated by the Government of the Federated Malay States, which also owns all the lines except a stretch of 120 miles through the unfederated Malay State of Johore, which is leased from the Johore Government. The total mileage of this system at the close of 1927 amounted to 1200 miles of meter-gauge track, of which 753 miles were main line, 161, branch line, 166, sidings, and 120, leased line. The total freight traffic in 1927 amounted to 2,463,185 long tons, as compared with 2,259,005 tons in 1926. Railway operating revenues amounted to 20,697,540 Straits' dollars as compared with 19,622,027 in 1926. Other revenues derived from steamer services, ferry services, docks, etc., amounted to 2,317,975 dollars in 1927, as compared with 2,018,516 in 1926. Railway operating expenses in 1927 amounted to 17,295,602 dollars, and other expenses to 2,153,900 dollars, in comparison with 13,356,059 dollars and 1,857,041 dollars respectively. A large portion of the heavy expenditures for 1927 was necessitated by repairs to areas damaged by floods. These figures do not include capital expenditure in 1927 which amounted to 6,439,767 dollars, of which amount 3,538,574 dollars were expended for railway construction in the states of Kelantan and Pahang. This construction was still proceeding. The motive power and rolling stock in operation at the end of the year consisted of 206 locomotives, 4709 freight cars, and 387 passenger cars. During the year 8 locomotives, 56 freight cars, and 2 passenger cars were purchased. The general condition of the rolling stock was good.

The States are under British protection and the British Government is represented by the Governor of the Straits Settlements who is *ex-officio* high commissioner for the Federated

Malay States. High Commissioner in 1928, Sir Hugh Charles Clifford.

FEDERATION OF LABOR, AMERICAN. See LABOR, AMERICAN FEDERATION OF.

FENCING. The fencing competitions at the Olympic Games (q.v.) afforded the high lights of this sport in 1928, but the usual annual features in the United States also furnished keen rivalry. Lieut. George C. Calnan again won the national foils title and was placed second to Leo Nunes of the New York A.C. in the *épée* contest. Calnan added to his laurels by leading the Fencers Club to victory in the national foils, *épée* and three-weapon team championships. Nicholas Muray of the New York A.C. won the national sabres title.

Yale, Army, Columbia, and Princeton shared the honors in intercollegiate competition. Yale won the foils team title, with her Captain Every victorious for the second year in succession. Columbia took the sabres team championship, Norman C. Cohn of that university winning the individual sabres title. Tracy Jaesckel of Princeton defeated Thomas Sands of the U. S. Military Academy in a fence-off for the *épée* individual title, but Sands and John Hunrichs succeeded in retaining the *épée* team championship for the Army.

FERRATA, GIUSEPPE. An Italian pianist and composer, died in New Orleans, in April. He was born at Gradoli, Italy, Jan. 1, 1865. He studied in Rome under Sgambati, Terziani, and Leonardi and, as winner of a scholarship, had the fortune of becoming one of the last pupils of Liszt. From 1885-90 he made tours of Italy as a pianist. In 1892 he came to Pittsburgh as director of music at Beaver College. From 1909 until his death he was head of the piano department and professor of composition at Tulane University in New Orleans. An opera, *Il Fuorisito*, received honorable mention at one of the Sonzogno competitions, but was never performed. His other works include a symphonic poem, three string-quartets, pieces for orchestra, four masses, and numerous works for organ and for piano.

FERRIS, WOODBRIDGE NATHAN. American educator and public official, United States Senator from Michigan, died at Washington, D. C., March 23. He was born at Spencer, N. Y., Jan. 6, 1853, and was educated at the Oswego, N. Y., Normal and Training School and the medical department of the University of Michigan. He served as principal of a business college and academy at Freeport, Ill. (1875-76) and of a similar institution at Dixon, Ill. (1878-79), as professor at Rock River University, Dixon (1876-77), and as superintendent of schools at Pittsfield, Ill. (1879-84). Removing to Big Rapids, Mich., he founded (1884) and was thereafter president of the Ferris Institute. He was also president of the Big Rapids Savings Bank. After failing of election as Governor of Michigan on the Democratic ticket in 1904, he was elected in 1912 and again in 1914. In this office he aroused considerable criticism by his management of a strike situation in the Michigan copper mines. He was elected United States Senator for the term 1923-29. He was put forward as a Presidential candidate in the "preferential primaries" in his State in 1924, and was defeated by Henry Ford by a narrow margin.

FERTILIZERS. The fertilizer industry was being strongly influenced by the rapid develop-

ment in production of synthetic nitrogen compounds and of various concentrated forms of fertilizers. As stated in the *Report of the Chief of the Bureau of Chemistry and Soils* for 1928, "the present trend in fertilizer manufacture is toward the more concentrated mixtures which make possible substantial reductions in transportation, sacking, and handling costs. These fertilizers, in turn, call for more concentrated ingredients, fertilizer salts in which nitrogen, phosphoric acid, and potash are combined with the minimum of non-fertilizing elements." The average plant food content of mixed fertilizers produced in the United States was steadily rising and approached 17 to 18 per cent. One result of this was that, while the production of fertilizers in the United States had remained relatively stable at about 7,500,000 tons for several years, the actual plant food supplied by them had shown a marked increase.

Fertilizer consumption in the United States was far below the potential productive capacity of the factories, which was reported to be 12,000,000 tons of complete fertilizer per year. The United States was below European countries in the profitable use of fertilizers. It was estimated that nearly 6,000,000,000 pounds more of phosphoric acid, nitrogen, and potash were removed from the soil of the United States than was returned in the form of manures and fertilizers. The general introduction of more concentrated fertilizers by decreasing the cost of transportation and handling would no doubt have a powerful influence in increasing the use of fertilizers and the profitable production of crops.

The latest available figures indicated a slight decline in value of exports and a decided increase in imports of fertilizers by the United States in 1928, as compared with the previous year. Exports of rock phosphate remained quite stable, but exports of superphosphates showed a decided increase. Imports of phosphates showed a marked increase. Imports of nitrogenous fertilizers increased. Imports of both nitrate of soda and sulphate of ammonia increased. There was a decided increase in imports of synthetic nitrogen compounds and like products. Exports of sulphate of ammonia decreased. Imports of potash fertilizers increased. There was an increase in exports of fertilizer mixtures.

Of the world's production of pure nitrogen (about 1,250,000 metric tons) approximately 1,200,000 tons is used in agriculture. Since 1913 the consumption of nitrogen fertilizer per acre of cultivated land had increased 309 per cent in Denmark, 170 per cent in Japan, 108 per cent in Italy, 80 per cent in Germany, 67 per cent in the United States, 57 per cent in France, and 9.5 per cent in Great Britain, and this increase had been followed by profitable returns in crop production. This result had been made practicable by increased production of sulphate of ammonia and various forms of synthetic nitrogen compounds.

The world's production of sulphate of ammonia, both as a by-product and from synthetic sources, had increased steadily during recent years, but the output of the synthetic product had increased and was still increasing much more rapidly than that of the by-product and nearly equaled the latter. A large proportion of the world's supply of inorganic nitrogen was being derived from chemical fixation of the nitrogen of the air, and the possibilities in this direction

seem almost unlimited. This advance had been made mainly under private auspices and initiative. A bill providing for government ownership and operation of the Muscle Shoals plant for the production of power and nitrogen compounds passed the Seventieth Congress shortly before the end of its First Session, but did not receive the approval of the President, who had expressed objection to any disposition of the plant that would place the Government in the power or nitrate business.

There were no especially noteworthy developments in the phosphate industry during the year. The increased use of fluorine compounds as insecticides has called attention to the importance of the production of such compounds as a by-product of the phosphate industry, and study is being made of the possibilities in this direction. Progress was reported in the development of cheap methods of producing liquid phosphoric acid from phosphates. Discovery and exploitation of phosphate deposits in different parts of the world were reported. The opening of large phosphate fields in Transjordan, which may have an especially important bearing on agricultural development in Palestine, was reported.

The development of new sources of potash in different parts of the world continues. American production had increased, although relatively small—about 1 per cent of the total world production. American imports of potash, which represent an annual expenditure of about \$18,000,000, came mainly from German and French sources. Of the 1928 world production of potash (1,650,000 tons of K.O.), about 80 per cent comes from the mines of Stassfurt and Galicia and 20 per cent from the Alsatian deposits.

BIBLIOGRAPHY. Sources of information regarding progress in the production and use of fertilizers are numerous. Attention is called especially to the following: Current progress in the fertilizer industry is recorded in *The Fertilizer Review*, published by the National Fertilizer Association, at Washington, D. C. Statistics of the fertilizer trade and industry will be found in reports of the Bureau of Foreign and Domestic Commerce and the Census Bureau of the Department of the Interior. The subject of nitrogen was discussed quite fully from an industrial standpoint in a series of papers presented at the meeting of the American Chemical Society, in September, 1928 (see *Congressional Record*, Dec. 6, 1928). The concentrated fertilizing materials which were being imported in considerable quantity from Europe are discussed in Tennessee Experiment Station Circular 18. Two books of special interest appearing during the year are *Handbook of Fertilizers*, by A. F. Gustafson (New York and London, 1928), and *Fixation of Atmospheric Nitrogen*, by F. A. Ernst (New York, 1928). See **CHEMISTRY, INDUSTRIAL**.

FESTIVALS. See **MUSIC**.

FIBIGER, fē'bi-gēr, JOHANNES. Danish pathologist, and winner of the Nobel Prize for medicine in 1926, died at Copenhagen, January 30. He was born in 1867, and became professor of pathological anatomy at the University of Copenhagen in 1900. After first devoting himself to work in diphtheria and tuberculosis, he engaged, in 1913, in chemical experiments dealing with cancer, tending to bring the study of that disease more into the field of exact science. His cancer research has been termed the greatest contribution to experimental medicine in

recent generations, and it made possible the further work of Yamagiwa, Itchikawa, and Tsutsui. Dr. Fibiger was vice president of both the Danish Cancer Committee and the International Association for the Investigation of Cancer, and, in 1926, he was made rector of the University of Copenhagen.

FIJI ISLANDS. A British Crown colony, comprising a group of islands in the South Pacific about 250 in number (some 80 inhabited). Area, 7083 square miles; population at the census of 1921, 157,260, of whom 84,475 were Fijians, 60,634 Indians, and 3878 Europeans. The estimated population Jan. 1, 1927, was 171,644. The largest island is Viti Levu (4053 square miles) and the next, Vanua Levu (2130 square miles). The capital, Suva, on the south coast of Viti Levu, had a European population (including suburbs) of 1741. Coconuts, sugar cane, rice, tobacco, tea, tropical fruits, beans, sisal, and hemp are the principal products. Horses, mules, cattle, sheep, goats, and pigs are raised. No later figures for trade are available than those for 1926 when the exports were valued at £1,740,427, and the imports at £1,480,945. The revenue in 1926 was £584,515; expenditure, £535,957; public debt, £153,550. The total tonnage which entered and cleared in 1926 was 1,357,907 tons of which 983,402 were British. A privately owned small-gauge railway of 120 miles runs from Tavua to Sigatoka. The executive power is vested in a governor, appointed by the Crown, aided by an executive council and a legislative council of which the governor is president. The governor is also high commissioner for the Western Pacific. Governor in 1928, Sir Eyre Hutson, K.C.M.G., appointed 1925.

FINANCES. See **PUBLIC FINANCES, U. S.**

FINANCIAL REVIEW. Notwithstanding that business in the United States was somewhat depressed during the forepart of 1928, financial operations were active practically from the beginning of the year; while, after a short rest during the summer, the general scope of the speculative markets acquired an unprecedented breadth, which was maintained practically until the close of December. In spite of the fact that during the middle and latter part of the year rates of interest and discount were exceedingly high, both speculative and investment operations continued with but little heed to the money situation, and there was an enormous amount both of refunding and new financing. Popular interest in stock and bond operations was practically at high point, and there had been no preceding year in which the activity of stocks or the variation in their price was greater, taking all in all.

STOCK EXCHANGE OPERATIONS. The volume of operations on the New York Stock Exchange reached the wholly unprecedented level of 920,000,000 shares in 1928 as against 577,000,000 the year before, while the total volume of bonds (which lost popularity as stock gained it) trans-

ferred was \$2,935,661,100 as against \$3,321,000,000 par value the year before. This extraordinary breadth of trading in stocks gave rise during the latter part of the year to a succession of immensely heavy trading sessions on the Stock Exchange, the total being 29 days on each of which a total of 1,000,000, shares or more was transferred, while included in this number were two which exceeded 5,000,000 each, and six that exceeded 3,000,000. The tremendous turnover of business kept brokers' forces keyed up to the utmost, and advanced the price of seats on the Exchange to the level of \$575,000 before the close of the year. It had been predicted by some that the very high level of values which existed at the opening of the season would result in sharp reaction, and in some classes of stocks this was true, a decisive setback, for example, occurring at the beginning of the summer. Nevertheless, taking the year as a whole, prices not only did not react, but showed in many cases enormous gains, even above the very high level which prevailed at the opening. An index of one hundred representative shares showed, at the high point of the year, a combined average of 181.11 on November 30, as compared with a low of 141.11 near the opening of the year on February 20; while a similar index of thirty representative bonds showed a quotation of 102.22 at the high point on January 6 as compared with 98.60 at the end of the year's dealings.

Although, at the opening of summer, decisive reaction had occurred, and although on two or three other occasions, particularly at the beginning of December, sharp recessions had taken place, they had not lasted long enough, nor had they been of sufficient breadth, to be regarded as being much more than corrective readjustments designed to bring about a better technical position in the market. Save for these temporary and sporadic changes, the progress was steady, and was due to two principal factors—the continued presence of an almost unlimited amount of lending power furnished by the member banks (and eventually by the reserve banks), and the maintenance of an underlying strong base of profitable business. Influenced by these conditions, there was a far larger interest on the part of the public in general than had ever before been exhibited in American financial history. The announcement of unusual stock dividends by a few corporations and a great number of reductions in the par value of stock, resulting in profitable "split-ups" of existing shares, continued to maintain the popular interest in the whole situation, and if anything to broaden the general interest in buying both for cash and on margin. The presidential campaign, which had been viewed with some doubt up to the opening of November, resulted in a way which was considered by some as warranting renewed optimism with reference to the attitude of the Government toward business, and as a result there was an enormous wave of buying, which, immediately after the election, sent prices vigorously ahead to new high levels.

For the most part, business (as elsewhere seen) was good, yet it remained true that in a number of industries, recovery and improvement was only partial and unsatisfactory. The result was that in such businesses as coal, some phases of the textile trades, and others, prices of shares responded very slowly, or in some cases

even receded. Nevertheless, the number of enterprises in which gains were continuous and sizeable was so great as practically to offset in the popular mind the discouraging features of the outlook, an attitude which was greatly confirmed by the improved average net earnings of large groups of enterprises, which began to become known to the public toward the end of the calendar year.

Several industries showed during the year very decisive power of growth accompanied by ability to command better prices for their products, and as a result sharply rising values for securities representing them. Among these, the outstanding example was perhaps furnished by the copper shares which reported at the close of the year a fixed price of 17 cents per pound for ingot copper, the highest value of the metal for a number of years. Since at that price almost any active copper mine in the United States can make profits, the values of all copper shares rose enormously, some of them doubling in value, while a few had even greater increases. These increases were accompanied by higher dividends and extra distributions of various kinds.

In the oil industry, a similarly positive change occurred. During the year 1927, there had been overproduction of oil, depression in the prices of oil and its derivatives, and consequently low levels of oil shares and securities generally. At about the beginning of 1928, oil producers had succeeded in "getting together" with regard to a programme of "voluntary" restriction of output, which was quite successful and resulted during the year in reducing the amount of "carry-over" that had been so troublesome a feature in the industry for a number of years before. Accordingly, oil shares rose decidedly, upon the basis of good prospects in the industry, and during the second half of the year, earnings advanced quite distinctly. A good many oil shares were from 40 to 50 per cent higher at the end of the year than at the beginning.

Among the public utility shares, earnings were good throughout the year, while the progress of reorganizing the industry brought many mergers and regroupings of companies with corresponding financial manipulation and advances in stock prices. In this group also, therefore, there were not a few enterprises whose stock actually doubled in value during 1928, largely due to good earnings and prospects of financial reorganization, although without very much increase in dividends which continued low.

NEW ISSUES. New issues during 1928 continued to be very numerous although those of foreign origin were discouraged by reason of the high rates for money which prevailed during the latter part of the year, so that there was a reduction in the latter department from about \$1,592,000,000 to \$1,426,000,000. However, the increase in domestic flotations much more than made up for this minor reduction in foreign bonds. The tendency of enterprises to finance themselves by suspending their borrowing at the banks, and instead, placing their new capital obligations through the stock and investment markets, continued, while at the same time the many changes in capital structure, to which reference has already been made, in the case of some special industries necessitated a very special amount of refunding operations.

According to the compilations of *The Journal*

of Commerce of New York, the new and refunding issues of 1927, classified by type of issue, and arranged to show division of the securities among major industries were, during 1928, as shown in the accompanying table:

SUMMARY OF NEW FINANCING FOREIGN

	<i>Government and Municipal</i>	
	1928	1927
Bonds	\$764,943,000	\$786,630,600

Total .	\$9,691,606,499	\$1,006,012,975	\$8,690,693,524

MOVEMENT OF GOLD. During the year 1928 movements of gold into and out of the United States and into and out of its ownership, continued to be large although these movements were much more pronounced early in the year than during the later months. The outward movement continued active until after mid-year and was sporadically noticeable from then on until the end of the twelvemonth. According to figures furnished by the Secretary of the Treasury, the total outgo up to the end of June, 1928, was about 280 million dollars while subsequent losses brought the net outgo for the year close to 400 million dollars. The Federal Reserve statement already elsewhere presented (see **BANKS AND BANKING**) shows a loss in holdings of the reserve banks of considerably less than that amount, the net outgo, as compared with the end of 1927 being not more than 150 million dollars. These foreign shipments of gold were primarily intended for the purpose of reestablishing foreign bank reserves, particularly those of France, which took about 257 millions, and of Argentina, which received about 131 millions. Other shipments, such as those to Germany, Italy, Poland, Brazil, and Uruguay grew out of the necessity of maintaining, or the desire to re-establish, a gold standard in those countries, or to maintain a stable rate of exchange between them and others. The flow of silver to the eastern countries was considerably less than in earlier months and on the whole the stability of gold holdings, internationally viewed, was considerably greater than during the preceding year. Federal Reserve banks continued the practice of "earmarking" gold in the United States for the purpose of avoiding actual shipment in those cases where such earmarking furnished an acceptable substitute for real transfers. In the following table, which affords a survey of imports, exports, and earmarking the national movements of gold imported into, and shipped away from, the United States are briefly summarized.

GOLD MOVEMENTS

1928	<i>Imports</i>	<i>Exports</i>	<i>Excess imports or exports</i>	<i>Gold Earmarked End of month</i>	<i>Monetary Gold stock End of month</i>
January	\$38,320	\$52,086	—\$13,766	\$193,919	\$4,373,000
February	14,686	25,806	—11,120	191,051	4,362,000

ESTIMATED BALANCE OF INTERNATIONAL PAYMENTS OF THE UNITED STATES, CALENDAR
YEARS 1926 AND 1927—Continued
[In millions of dollars]
1926 (revised) 1927

	Exports, visible and in- visible (credits)	Imports, visible and in- visible (debits)	Balance	Exports, visible and in- visible (credits)	Imports, visible and in- visible (debits)	Balance	Year's net change
American stocks and bonds bought back from foreigners	509	— 509	639	— 639	— 130
Total of private funded-capital items	1,630	2,234	— 604 ^b	2,014	2,685	— 671 ^b	— 67
UNFUNDED ITEMS							
Net change in international banking ac- counts, as revealed by questionnaire	359	+ 359	— 359
PURE CASH ITEMS ^c							
Gold	116	214	— 98	207	201	+ 6	+ 104
Changes in earmarked gold	50	24	+ 26	183	23	+ 160	+ 184
Total of gold and currency	166	238	— 72	390	224	+ 166	+ 238
Grand total, all items	8,713	8,899	— 186 ^d	9,115	9,121	— 6 ^d	+ 180 ^d

^a Largely a deduction from American tourist expenditures.

^b Estimated "net export of capital."

^c Observe that imports (receipts) of gold and currency appear in the debit column, while all other entries in the debit column are predominantly cash payments; the credit column contains similarly divergent entries.

^d Discrepancy, due to errors and omissions. Total errors would probably be much greater, since errors tend to offset one another.

The major part of these exports went to the following countries:

France	\$257,000,000
Argentina	181,000,000
Brazil	55,000,000
United Kingdom	41,000,000
Germany	27,000,000
Italy	20,000,000
Uruguay	11,000,000
Poland	8,000,000

INTERNATIONAL BALANCE. As a result of a merchandise balance which during the year gave to the United States a net credit of \$1,040,000,000 the country was able to bear gold movements and heavy new financing with comparatively little disturbances though the rising cost of money bore witness to the narrowing of the available capital margin. The estimated Balance of International payments computed in 1928 by the Department of Commerce for the year 1927, furnished the background for these changes during the past 12 months.

COMMODITY PRICES. Prices of the major articles of necessity showed very substantial stability during the year 1928, although, of course, the usual seasonal fluctuations were to be noted as well as some changes due to alterations in business organization and in arrangements for the definite fixing of values. Prices of agricultural products were rather more stable than during preceding years and on the whole were more favorable to the farmer class in the aggregate. Wheat (No. 2 Red) was reported at the close of 1928 as bringing approximately \$1.54½ per bushel in Chicago as compared with the price a year earlier of \$1.49¾ to \$1.50¾. Cotton showed not only greater stability but a higher average level of prices than in 1927. At the opening of the year the quotation on middling upland cotton had been approximately 20 cents and during 1928 this figure was maintained with a slight advance to approximately 20.55 cents. Discussion of methods on the N. Y. Cotton Exchange had led to substantial alterations in the regulations covering deliveries and quotations and these changes were considered favorable to the farmer. Espe-

cially high prices were realized during the year by producers of meats of all classes, although some reaction occurred late in the season. Family beef which had been \$33 at the close of 1927 was quoted to \$30 to \$31, and mess pork which had been quoted at \$32 to \$34 at the beginning of 1928 was approximately \$30 to \$31 at the close of the year. Nearly all agricultural commodities were, however, higher than recent yearly averages, the result being to give the farmer a distinctly better purchasing power. See AGRICULTURE and articles on various crops.

Import commodities, such as rubber, sugar, coffee, and others, indicated continued disposition to decline for a variety of reasons, partly, as during the preceding year, the result of alterations in foreign methods of price control. On the other hand, home control of such prices of articles as copper and of oil made very decided progress during the year 1928. The net result, however, was to leave the price index of wholesale prices very little altered as an average from its position 12 months earlier, the index for December 1928 standing at approximately 96.7 per cent as against 96.8 per cent in 1927.

FOREIGN EXCHANGE. Efforts toward stabilization which had been in progress in various countries ever since 1925 continued during the year 1928, the result being to advance the movement for monetary reform quite materially. Italy just at the close of 1927 had announced her intention of fixing the value of the lira at 19 to the dollar and the process of defending and confirming this policy in application was vigorously prosecuted throughout the fall of 1928. France, early in the year, made known her definite stabilization of the franc at approximately the price which had prevailed during the preceding months and which was roughly equivalent to 24 to the dollar. Substantial success, at least of a preliminary sort, was attained both by Italy and by France in the maintenance of these values during the year, the result being to establish something approximating a "pegging" of exchange with the United States and England. Inasmuch as a similar condition already prevailed as regarded marks and sterling in relation to dollars, fluctuations in foreign exchanges

so far as the major countries were concerned largely disappeared and with their disappearance a strong tendency to greater stability in the minor exchanges naturally developed. The accompanying table sketches the major fluctuations in exchange quotations occurring during the year.

MONEY RATES. Money rates underwent very unusual and extreme fluctuations during the year 1928. At the opening of the year, there was already some indication of tightness and of scarcity in the money market and these conditions continued to develop during the first half of the period. The upward movement of rates, although the direct outgrowth of steadily increasing absorption of credit in connection with stock-exchange loans, represented the conceded failure on the part of the banking authorities in the successful operation of their policy of maintaining low discount changes in order to safeguard the interests of the Bank of England and its currency reform which had been undertaken a year earlier.

Light was thrown upon the discount policy of the Federal Reserve System during the years 1927-28 by the annual report of the Secretary of the Treasury filed with Congress at the close of 1928. In this the Secretary explained the low-rate policy of 1927 officially for the first time, saying:

As it became apparent, first, that the objects of the policy originally adopted were being accomplished, and, second, that speculation was growing, the policy was reversed. From the middle of December onward the reserve banks stopped offsetting gold exports by the purchase of securities, and allowed gold exports to work their usual effects on the credit situation. In January the system went further. More than \$100,000,000 of securities were sold. Between the latter part of the month and March 1, the discount rates of all of the Federal Reserve banks were raised from 3½ to 4 per cent. The loss of gold by export and the sale of securities forced the banks to increase their borrowings. However, the action taken early in the year unquestionably was not effective with reference to speculation, partly due to the activities of powerful groups of speculators, and partly due to the fact that the public in general believed and acted as if the price of securities would indefinitely advance.

When it became apparent in March that repeated increases in credit were again taking place for speculative purposes, the Federal Reserve System resumed its sale of securities and discount rates were still further increased in April, May, June, July, and August. The discount rate at all Federal reserve banks was 4 per cent on June 30, 1927. One year later the rate at all Federal Reserve banks was 4½ per cent. There were increases to 5 per cent, becoming effective from July 11 to August 1, 1928, in all Federal Reserve banks except those in Kansas City, Minneapolis, Dallas, and San Francisco.

During the autumn of 1928 Governor Roy A. Young of the Federal Reserve Board delivered two addresses before organizations of bankers in which he spoke reassuringly of the situa-

tion and promised further extensions of credit if needed during the remainder of the year. Governor Young had already earlier in the year appeared before the Senate Committee on Banking and Currency and had stated that he had no reason for thinking that brokers' loans were too high. His general attitude, therefore, was

regarded by many persons as rather favorable on the whole to active stock-market use of bank credit. Apparently, then, the position of the reserve board was not such as to offer obstacles to undue credit expansion.

However, this attitude on the part of the board could not, and did not, prevent a progressively increasing scarcity of money. Call rates steadily advanced after mid-summer until at the close of the year they were frequently from 10 to 15 per cent, the highest figure on the Stock Exchange being about 12 per cent. This, however, was rightly regarded as an abnormal situation for a country with high financial standing, powerfully organized and possessed of the greatest stock of gold in the world. An anomalous phase of the whole situation was found in the maintenance of a low reserve rate in the western districts on the excuse that this would assist in providing cheap money for the farming interests.

As a matter of fact the rates at reserve banks had no particular relationship to commercial borrowing rates, but it was an interesting phase of the whole situation that there was throughout the year a disposition on the part of the banks of the United States to maintain their loans to commercial customers at about the same level as in the past, taking care to avoid anything that might appear like an attempt to put rates forward to figures that would appear to have been influenced by the high charges prevailing in the stock market. There was therefore, during the bulk of the year, and especially during the latter months a distinct differential against stock-market transactions so far as open-market borrowing was concerned, notwithstanding that during the latter part of the year the market was constantly endeavoring to draw funds away from the interior by the offer of very high rates, and notwithstanding also that reserve banks maintained consistently throughout the year the same general rate of discount and same discount policy both with respect to loans designed for stock-market purposes and loans designed for commercial objects.

The unfavorable conditions which had developed with respect to farm-land banks during the preceding year were not repeated, but some amelioration occurred. Taken in conjunction with the

more settled banking conditions throughout the agricultural region it soon became clear that farm securities were beginning to recover the preferred position which they had had in former years, so that it could be said that the agricultural investment field was decidedly better. On the other hand, bankers' acceptance credit, which had been a favorite form of lending to presumably choice customers during preceding years, was seriously abused. On account of the great disparity between stock-market and even commercial rates on the one hand, and acceptance rates on the other, the volume of acceptances was greatly enlarged in the endeavor to get money out of Reserve Banks. Toward the end of the year it rose to a record high figure of about one and a quarter billion dollars and among other effects following from it was that of practically driving the older commercial paper out of use. So serious did the abuse become that toward the close of the year, a movement was begun in the reserve system for the purpose of raising the rate on acceptances to a level equal to that of commercial paper, a situation which had existed only once in the history of the Federal Reserve System, for a part of the year 1920.

In the investment field the declining yield of bonds and preferred stocks which had been in progress during 1907 was reversed, and distinctly better conditions from the income standpoint prevailed, fixed securities tending to react in quoted value at the same time that they accordingly yielded a better net income upon the investment in them. Taken in conjunction with the improving earnings of many companies, this situation tended to give to the investor in fixed-rate securities a distinctly better position than he could get as a common-stock holder insofar as the latter situation gave him a speculative opportunity that would otherwise have been out of the question. Very substantial changes in the general investment position of the community were accordingly characteristic of the year 1928.

FINDEISEN, NIKOLAI FEDOROVITCH. A distinguished Russian musicologist, died at Leningrad, September 20. He was born there, Aug. 5, 1868, and studied music under Philip and Nikolai Sokolov. In 1894 he founded the *Russkaya Muzykalnaya Gazeta*, which immediately was recognized as the most important musical periodical of Russia, and by the end of the century was definitely established among the world's most scholarly and influential musical journals. After retiring from its editorship, in 1918, Findeisen founded the Museum of the Leningrad State Philharmonia, of which he was curator until his death. His life work, which occupied him for forty years until its completion in 1928, is *The Outlines of the History of Music in Russia from the Earliest Times to the End of the Eighteenth Century*, to be published in seven volumes (in Russian and English). The first volume appeared a few weeks before his death. He also wrote several books dealing with various aspects of the work of Glinka, a *History of Russian Song* (1903), *History of the Petrograd Section of the Imperial Russian Music Society* (1909), valuable monographs on Dargomyzhsky, Rubinstein, Rimsky-Korsakov, Bessel, and Smolensky. He edited the correspondence of Stassov, and was one of the principal con-

tributors to the Russian editions of Riemann's *Musiklexikon* (1901, 1916).

FINE, HENRY BUCHARD. American mathematician and educator, died at Princeton, N. J., December 21. Born at Chambersburg, Pa., Sept. 14, 1858, he was graduated from Princeton in 1880, and, after receiving an A.M. degree in 1883, his Ph.D. degree was conferred by the University of Leipzig in 1885. Having been tutor at Princeton, 1881-84, he was made assistant professor on his return from Germany, and in 1891 was appointed Dod professor of mathematics, serving in that capacity, and as dean of the department of science from 1911 until his death. He was also dean of the faculty, 1903-12, and was acting president in the last two years of his office, between the administrations of his close associate, Woodrow Wilson, and John Grier Hibben. Williams conferred on him the LL.D. degree in 1909. Dean Fine, who was president of the American Mathematical Society, 1911-12, contributed many articles to scientific periodicals and wrote: *The Number System of Algebra* (1891, 2d ed., 1903); *Euclid's Elements* (1891); *A College Algebra* (1905); *Coördinate Geometry*, with Henry Dallas Thompson, (1909); and *Calculus* (1927).

FINE ARTS. See PAINTING; SCULPTURE; ART EXHIBITIONS; ART MUSEUMS; ART SALES; ETC.

FINLAND. An independent republic of Europe; formerly a grand duchy of the Russian Empire; an independent republic since 1917; bounded on the east by Russia, on the north by the Arctic Ocean and Norway, on the west by Sweden and the Gulf of Bothnia, and on the south by the Gulf of Finland. Capital, Helsingfors.

AREA AND POPULATION. The total area exclusive of water is 132,608 square miles: population, according to the census of 1920, 3,364,807; estimated Dec. 31, 1927, 3,582,000. In 1927 the rural population was 2,962,000. The movement of population in 1926 was: Births, 76,875; deaths, 47,526; marriages, 22,695; emigration, 6043. The principal towns with their populations in 1927 were: Helsingfors, 221,000; Abo, 63,000; Tammerfors, 53,000; and Viborg, 50,000. The Evangelical Lutheran religion is that of the national church to which the bulk of the population belongs, but freedom of worship is granted to all.

EDUCATION. Primary instruction is free and compulsory between the ages of 7 and 15. For elementary education in 1926 there were in the country 4548 elementary schools with 220,274 pupils; 2552 lower elementary schools, with 64,052 pupils; and 867 infant schools under the superintendence of the church with 96,035 pupils. In the towns there were 1310 classes of higher elementary schools with 40,091 pupils. For secondary education there were 116 lycées, leading to university, 2304 teachers and 35,537 pupils; 65 middle schools, with 622 teachers and 9206 pupils; 8 training colleges for elementary school teachers, with 114 teachers and 1614 students; 6 training schools for infant school teachers; and 51 high schools for the people, with 352 teachers and 2745 students. There are three universities: One at Helsinki, with 308 teachers and 3646 students in 1927; and two at Turku; one Swedish, with 39 teachers and 172 students; and one Finnish, with 25 teachers and 302 students. There is also a great variety of agricultural, horticultural

tural, forestry, industrial, and other technical schools.

PRODUCTION. Although the cultivated area of Finland covers only 6.1 per cent of the land, agriculture is the chief occupation of the people of the Republic. The acreage and yield of the principal crops in 1926 were as follows: Rye, 565,283 acres, 302,490 tons; barley, 272,103 acres, 156,100 tons; oats, 1,090,209 acres, 592,726 tons; potatoes, 171,139 acres, 851,008 tons; hay, 2,460,126 acres; total land under cultivation in 1926, 5,292,723 acres. The livestock census in 1926 showed 399,998 horses; horned cattle, 1,860,479; sheep, 1,413,697; goats, 11,076; and pigs, 390,536. The butter production in the same year was 20,062 tons. The forests are a great source of wealth, Finland being better off in that respect than any country in Europe except Russia. Finland had in 1926, 3526 large factories, employing an aggregate of 149,367 workers, and yielding an aggregate product of 10,935,000,000 marks. The three leading groups from the point of view of output were wood industries, paper factories, and iron and mechanical works.

COMMERCE. Finland's imports in 1927 were valued at 6,367,000,000 marks and her exports at 6,322,000,000 marks, showing an adverse trade balance of 45,000,000 marks. The leading exports were timber, pulp and paper, and food obtained from animals; the leading imports, cereals, colonial produce and spices, and metals.

FINANCE. The proposed Finnish budget for 1929, as approved by the President of the Republic on Aug. 20, 1928, and submitted to the Diet, called for expenditures of 4,232,300,000 Finnish marks (\$106,654,000), of which the ordinary group accounts for 3,491,500,000 marks and the extraordinary for 740,800,000 marks. Total income was calculated at 4,206,200,000 marks (\$105,996,000), of which 4,203,300,000 marks were ordinary revenues. The balance was to be effected by a transfer of 26,100,000 marks from the cash reserve, as against a balance for 1928 composed of 161,500,000 marks from the cash reserve and 117,600,000 marks from a foreign loan.

The 1929 proposals totaled practically the same as the 1928 budget, which was 4,233,100,000 marks. A notable improvement, however, was the increase of 265,200,000 marks in proposed ordinary income. Practically all categories of ordinary revenue show increases over the 1928 budget. An expected increase in the tax on automobiles was calculated to raise revenues from that source by 25,000,000 marks, to a total of 30,000,000 marks, all to be used for highway improvement. An increase of 22,500,000 marks in ordinary expenditure is offset by a similar decrease in the extraordinary accounts and represents largely a transfer of certain items. The proposed budget allows 1,007,500,000 marks for the Ministry of Communications—54,700,000 more than for 1928. Of this increase, 24,500,000 marks were to go for construction and upkeep of highways and bridges, the total appropriation for which was 126,000,000 marks; 25,400,000 marks were to go to the railways; and 2,600,000 to posts and telegraphs. Proposed extraordinary expenditures for communications amounted to 272,300,000 marks, a reduction of 32,600,000 marks. Of this amount, 100,000,000 marks were for new railway buildings, 79,000,000 for rolling stock, 13,000,000 for

extension of the telephone system, and 18,000,000 for grants for upkeep of highways. At the end of October, 1927, the total foreign debt was 2,236,029,000 marks and the internal debt, 492,716,000 marks.

COMMUNICATIONS. The State Railways of Finland constitute the only important railway system in that country. Their length at the end of 1927 totaled 6358 kilometers (195 kilometers double track) of 1.524-meter gauge, of which 1571 kilometers were branches and sidings. Operating revenues amounted to 836,181,015 marks, of which 259,660,953 marks were from passenger and 554,100,631 from freight. Other revenues, such as telegraphs, rents, etc., amounted to 22,419,431 marks. Operating expenses were 679,947,094 marks. Rolling stock in operation at the close of the year consisted of 547 locomotives, 19,484 freight cars, and 1301 passenger cars. All rolling stock receives close attention and was in good condition. For the five-year period, 1926-1930, the Diet passed a scheme of construction, which when completed will cover 840 kilometers of new railways. Of these plans for new construction, an appreciable portion already has been carried out. During 1928, work on the continuation of the railway from Tornio (Tornea) to Karunki was finally completed by the construction of the Karunki-Kauliranta line (51 kilometers) and its inauguration on Aug. 26, 1928. This railway which reaches almost to the Arctic Circle runs through the beautiful valley of the Tornio River. Traffic on this part of the railway is served by the port railway built to Roytta, the outer port of Tornio. Another important railway opened to traffic in 1923 was the Joensuu-Outokumpu line (50 kilometers), which joins the State's rich copper-mine districts to the railways of the country. Of other railways, the sections Nurmes-Kiehima (125 kilometers) and Oulu (Uleaborg) Vaala (92 kilometers) on the Nurmes Oulu Railway were opened to traffic in 1928, as well as the section Viipuri-Avrappaa (50 Kilometers) on the Viipuri-Valkjärvi Railway.

GOVERNMENT. According to the constitutional law of July 17, 1919, Finland is a republic. Executive power is vested in a president elected for six years by the votes of the citizens and in a ministry appointed by him but responsible to the diet; legislative power in a diet consisting of 200 members chosen by direct and proportional representative election, all citizens who have reached their 24th year possessing the right to vote. President of the Republic in 1928, Dr. Lauri Relander, elected Feb. 16, 1925. The Council of State, appointed on Dec. 17, 1927, was as follows: Prime Minister, Dr. Juho Sunila; Foreign Affairs, H. J. Procopé; Finance, Juho Niukkanen; Interior, Matti Aura; Defense, Jalo Lahdensuo; Justice, T. H. Malinen; Education, Rev. Antti Kukkonen; Communications, Dr. Emil Hynninen; Commerce and Industries, Pekka V. Heikkinen; Social Affairs, Kalle A. Lohi; Minister without Portfolio, Dr. K. T. Jutila.

HISTORY. During the year, Finland had trouble enforcing the prohibition law which had been on the statute books for a decade. Severe measures were enacted by the Government to curtail the consumption of liquor, which was stated to be greater than before the prohibition act was passed. The familiar phases of prohibition, such as doctors' prescriptions, the search

of private premises without warrants, and the obtaining of evidence against violators of the law by private citizens, and the destruction of fittings in "speakeasies" were dealt with in Finnish legislation to attempt to get rigid enforcement. Certain quarters of the Finnish press restated that old truth that a law which is unpopular with the people can never be enforced.

On December 13 the Agrarian Ministry of Dr. Sunila resigned when it failed, by one vote, to receive a vote of confidence. The vote was taken because a postmaster was allegedly appointed for political reasons and because the civic guard in a small town had raised its flag on a building in defiance of the city council—an act which the Government had ignored. On December 22, Dr. Oskari Mantere, of the Progressive party, became the head of the following cabinet: H. J. Procopé, non-partisan, remaining as Foreign Minister; A. Kotonen, non-partisan, Justice; T. M. Kivimäki, Interior; A. K. Cajander, Defense; U. Brander, Agriculture, with K. E. Linpa as his Assistant Minister; H. M. J. Relander, non-partisan, Finance; L. Ingman, Coalition, Education; J. Castren, Coalition, Communication; K. Jarvinen, Coalition, Commerce; and N. A. Manio, Social Affairs. The party affiliation of non-progressives only is given above.

FIRE INSURANCE. See INSURANCE; FIRE PROTECTION.

FIRE PROTECTION. The statistics for fire losses in the United States and Canada showed a slight improvement during 1928, as compared with the figures for 1927 and 1926, and a considerable improvement as compared with the record of each of the years since 1919, being the lowest in ten years. Inasmuch as the industrially created values increased each year by great sums and the aggregate value of property exposed to possible fire damage was vastly greater than it was in 1919, the encouraging features of the situation may be noted.

The 1928 fire loss as compiled from the daily loss records of the *Journal of Commerce* (New York) with proper adjustment for the small and unreported fires, reached a total of \$301,267,560, as compared with \$320,595,000 the previous year and \$393,011,500 in 1926. During the latter half of 1928 the fire record receded to figures much below the normal for some years past.

The monthly record of fire losses for the past three years given in the subjoined table from the *Journal of Commerce* affords a picture of the rather startling improvement that had developed since the fire-loss peak was reached in the years 1922 to 1926. The three-year monthly table of fire losses is as follows:

	1926	1927	1928
January ..	\$41,118,750	\$37,910,000	\$43,260,800
February ..	30,939,750	26,285,000	41,105,400
March	42,854,600	26,807,600	30,377,000
April	52,408,400	39,720,000	25,980,600
May	32,764,200	20,713,000	23,202,000
June	28,676,000	25,481,200	11,123,000
July	31,723,400	24,248,600	17,106,400
August	27,833,400	24,299,800	17,728,600
September ..	19,300,000	21,875,000	17,182,800
October	14,877,000	22,326,600	22,414,160
November ..	26,724,400	18,992,200	20,587,800
December ..	43,757,600	31,935,400	31,204,000
Total ...	\$393,011,500	\$320,595,600	\$301,267,560

While these figures were stated to be commendable for the reduction shown, they were

in no wise justifiable, and represented an economic waste of national resources that constituted a serious drain even upon a wealthy nation.

Figures on a somewhat different basis are annually announced by the Committee on Statistics and Origin of Fires of the National Board of Fire Underwriters and are given herewith for a period of years.

FIRE LOSSES BY YEARS

1927	\$472,933,969	1913	\$203,763,550
1926	561,980,751	1912	206,433,900
1925	559,418,184	1911	217,004,575
1924	549,062,124	1910	214,003,300
1923	535,372,782	1909	188,705,150
1922	506,541,001	1908	217,885,850
1921	485,406,012	1907	215,084,709
1920	447,836,877	1906	518,611,800
1919	320,540,399	1905	165,221,650
1918	353,878,876	1904	229,198,050
1917	289,535,050	1903	145,302,155
1916	258,377,952	1902	161,078,040
1915	172,033,200	1901	165,817,810
1914	221,439,350	1900	160,929,805

These figures represent the actual reported loss to which is added 25 per cent for unreported damage and destruction.

The very welcome decrease in fire losses in the United States in 1928 and 1927 resulted not only from improvements in building construction and stricter local requirements, the results of which were beginning to be felt, but also from better municipal and industrial house-keeping, in the maintenance of cities and buildings in a condition where the fire risk was materially reduced. In addition, the National Chamber of Commerce had been carrying on an important campaign throughout the United States, while the National Fire Protection Association had maintained a field engineering survey staff visiting cities where the per capita loss had been over \$4. The work of these organizations aroused local interest and secured improvements particularly on the prevention side, but in many cases the need for improved fire departments and water supplies was a serious handicap, particularly as many cities had reached their tax limits and extensions or improvements in fire or water service were beyond their means. In many cases lack of pension systems for the personnel of the fire department required the retaining of superannuated firemen who were neither physically nor mentally able to deal with the conditions developing at a serious fire.

In an interesting analysis made by the Actuarial Bureau of the National Board of Fire Underwriters for the year 1927, it was stated that the fire loss in that year had been reduced to \$472,933,969 from \$561,980,751 in 1926. These returns were based on actual returns on losses for 1927 amounting to \$378,347,175, and \$449,584,601 for 1926 to which as usual 25 per cent was added for unreported losses. While this indicated an improvement, it was really a very serious question, and an examination of the conditions revealed the fact that as a result of types of building construction permitted, almost every city was at the menace of possible conflagrations that might involve a fire damage of many million dollars. Unquestionably, there had been an improvement in this field, yet thousands of structures were erected each year that were unsafe from the standpoint of fire. The second great risk was the general carelessness of the people of the United States, and the

third was the inadequate fire protection in many localities which might involve insufficient water supply, low pressure, untrained or inadequate personnel, lack of hose, obsolete or inadequate apparatus, or in rural districts the utter absence of fire protection.

The Actuarial Bureau in its analysis called attention to the fact that figures recorded a saving of \$9,120,696 in fire losses from lightning over 1926, the figures for the two years being \$9,084,630 and \$18,205,326. Next in order came exposure (including conflagrations) with a reduction of \$8,991,807, the figures for the two years being \$45,082,747 and \$54,074,554, respectively. Stoves, furnaces, boilers, and their pipes decreased from \$21,977,114 in 1926 to \$17,986,432 in 1927, or a reduction of \$3,990,682. Defective chimneys and flues in 1927 caused losses of \$19,523,904, or a decrease of \$3,587,714 from \$23,111,618 in 1926. Sparks on roofs as a cause of fire decreased from \$14,172,947 in 1926 to \$11,256,303 in 1927, or a reduction of \$2,916,644. Sparks from combustion accounted for \$4,121,148 fire loss in 1927 as against \$6,343,519 in 1926, a reduction of \$2,222,371. There was a decrease in fire loss from petroleum and its products, which in 1926 accounted for fire losses totaling \$14,978,599 and \$12,691,718 in 1927. Spontaneous combustion was responsible for \$13,640,804 fire loss in 1927 as against \$15,498,812 in 1926, a saving of \$1,858,018.

REPORTED FIRE LOSSES—1927

West Virginia	5,484,186
Wisconsin	7,052,585
Wyoming	450,609
United States total	\$378,347,175

The totals of fire losses on the basis of individual States were as given in the preceding table.

Summarized on the basis of causes, totals were reached as follows:

STRICTLY PREVENTABLE CAUSES

	1927	1926
Defective chimneys and flues	\$19,523,904	\$23,111,618
Fireworks, firecrackers, etc.	893,663	718,942
Gas, natural and artificial	3,100,828	2,327,353
Hot ashes and coals, open fires	5,171,491	6,851,460
Ignition of hot grease, tar, wax, asphalt, etc.	1,699,298	1,880,240
Matches—smoking	29,345,929	30,160,233
Open lights	3,578,701	3,142,172
Petroleum and its products	12,691,718	14,978,599
Rubbish and litter	1,085,454	1,809,136
Sparks on roofs	11,256,303	14,172,947
Steam and hot-water pipes	184,931	395,640
Stoves, furnaces, boilers, and their pipes	17,986,432	21,977,114

PARTLY PREVENTABLE CAUSES

Electricity	12,360,557	13,783,303
Explosions	4,725,857	2,565,596
Exposure (including conflagrations)	45,082,747	54,074,554
Sparks from machinery	5,812,466	8,324,071
Incendiarism	2,403,615	2,202,492

Miscellaneous known causes	3,408,359	4,191,737
Sparks from combustion	4,121,148	6,343,519
Spontaneous combustion	13,640,804	15,498,812

UNKNOWN CAUSES

Unknown causes (probably largely preventable)	\$171,038,429	\$202,369,737
---	---------------	---------------

The Fire Waste Council of the United States Chamber of Commerce referring to the estimated losses by fire in 1927 of some 10,000 lives, called attention to the fact that of the deaths from fire 30 per cent were in the country and 70 per cent in the city. Of the injuries from fire 16 per cent were in the country and 84 per cent in the city. Of the deaths from fire, 31 per cent were children under 10 years of age and of the injuries, 13 per cent fall in the same class. Of the deaths by fire, 67 per cent occurred in dwellings as did 46 per cent of the injuries; 29 per cent of the deaths and 16 per cent of the injuries resulted from fires ignited by open flames. Defective heating devices were responsible for 16 per cent of the deaths and 11 per cent of the injuries. Improper use of inflammable liquids produced 23 per cent of the deaths and 26 per cent of the injuries.

FALL RIVER CONFLAGRATION. This most serious conflagration of the year started in the old Pocasset Mills in the early evening of Feb. 2, 1928, and destroyed some six blocks of the business centre of Fall River, Mass., with a loss estimated at over \$6,000,000. Notwithstanding the efforts of the city fire department, a high wind and near zero temperature soon placed the fire out of control and it raged for hours passing unchecked through buildings of inferior construction. Twenty-two cities and towns within a radius of 50 miles sent aid in men and apparatus, contributing 41 machines and 348 men, coming over the road in from 12 to 90 minutes, the last-named figure being required for three motor pumping engines from Boston. Good work on the part of the firemen served to prevent even greater damage.

Another serious fire of the year which caused the death of 38 people was on April 13, 1928,

when a gasoline explosion occurred in a garage at West Plains, Mo. The majority of fatalities were in a dance hall over the garage.

FISK UNIVERSITY. A coeducational institution for colored people at Nashville, Tenn.; founded in 1866. It consists of a liberal arts college, a music school, and a graduate department. The total enrollment of 503 for the autumn of 1928-29 included 206 men and 297 women. Enrollment in the music school was 82. The faculty numbered 35 and there were 24 administrative officers and assistants. The library contained approximately 21,000 volumes. The productive funds for 1927-28 amounted to \$1,289,678, and the income to \$395,930. Thomas Elsa Jones, Ph.D., was president; Ambrose Caliver, A.M., dean; and Jesse F. Beals, treasurer.

FITCHETT, WILLIAM HENRY. Australian editor and author, died at Melbourne, Victoria, May 25. He was born in Lincolnshire, England, went with his parents to Australia, and was educated at Melbourne University. He became a Wesleyan minister, and rose to the presidency of the general conference of the Methodist Church of Australasia. He was also principal of the Methodist Ladies' College, Hawthorn, Melbourne. He wrote many books, principally on religion and English and Australian history, and was best known to English readers as the author of *Deeds That Won the Empire*. He edited the *Australian Review of Reviews*, *Life* (a monthly magazine which he founded), *The Southern Cross*, and the *Melbourne Daily Telegraph*.

FIXED NITROGEN PRODUCTS. See **FERTILIZERS**.

FLAX. The flaxseed production in 1928 of 10 countries reporting to the International Institute of Agriculture, Rome, was estimated at 43,700,000 bushels as against 53,754,000 bushels in 1927, representing a reduction of 19.6 per cent. The 1928 production was also 13.1 per cent below the average production for the five years 1922-1926. The yields of the more important producing countries outside the United States were estimated as follows: India, 14,040,000 bushels; Canada, 3,499,000 bushels; Poland, 3,080,000 bushels; and Lithuania, 1,377,000 bushels. Argentina and the United Socialist Soviet Republics, the principal flaxseed producing countries, together with Uruguay, reported an increase in area over that of the preceding year. In the crop year 1927-28, Argentina produced 79,446,000 bushels and Uruguay 1,954,000 bushels.

According to estimates published by the U. S. Department of Agriculture, the flaxseed production of the United States in 1928 was 19,321,000 bushels on 2,721,000 acres, as compared with a yield of 25,847,000 bushels on 2,837,000 acres in 1927. The average yield per acre in 1928 was 7.1 bushels, or 2 bushels under that of the preceding year. The average farm price on Dec. 1, 1928, was \$2.01 per bushel or 15 cents above the corresponding price the year before. On this basis the total value of the crop in 1928 was \$38,857,000, while in 1927 it was \$48,079,000.

Of nine States reporting flaxseed production in 1928, the yields of the four producing the bulk

of the crop were as follows: North Dakota, 8,115,000 bushels; Minnesota, 5,518,000 bushels; South Dakota, 3,410,000 bushels; and Montana, 1,666,000 bushels. The average yields in these States were 7.1, 7.6, 5.8, and 8.5 bushels per acre, respectively. During the fiscal year ended June 30, 1928, the United States exported 589,173,000 pounds of linseed oil cake, 17,131,000 pounds of linseed oil-cake meal, and 2,221,000 pounds of linseed oil; and imported 18,112,000 bushels of flaxseed and 346,000 pounds of linseed oil.

Flax fibre production in ten European countries, exclusive of the United Socialist Soviet Republics, according to estimates received by the International Institute of Agriculture, Rome, indicated an increase in yield in 1928 of over 7 per cent above the yield of 1927 and of nearly 21 per cent above the average yield for the five years 1922-26. The yields of the principal fibre-producing countries were reported as follows: Poland, 164,106,000 pounds; Belgium, 81,342,000 pounds; Lithuania, including hemp fibres, 77,162,000 pounds; Latvia, also including hemp fibres, 33,510,000 pounds; The Netherlands, 30,865,000 pounds; and Czechoslovakia, 24,465,000 pounds. France in 1927 produced 45,579,000 pounds, Northern Ireland, 10,976,000 pounds; and the United Socialist Soviet Republics, which produce the greater part of the world's supply, 754,865,000 pounds. During the fiscal year ended June 30, 1928, the United States imported 6000 tons of manufactured flax to meet its fibre requirements.

FLETCHER, FRANK FRIDAY. American naval officer, died at New York, November 28. He was born at Oskaloosa, Iowa, Nov. 23, 1855, and was graduated from the United States Naval Academy in 1875. Rising through the successive grades, he was commissioned captain in 1908, rear admiral in October, 1911, and admiral in March, 1915. His various commands include, the torpedo boat, *Cushing*, the gunboats, *Kanawha* and *Eagle*, the cruiser, *Raleigh*, and the battleship, *Vermont*, and at one time he commanded the Newport torpedo station. He was appointed aide for the division on material to Secretary of the Navy George von L. Meyer, in 1910. Admiral Fletcher was placed at the head of the Third division of the Atlantic Fleet in 1913, subsequently commanding the Second and First divisions. It was he who, being in charge of the naval force on the west coast of Mexico from February, 1913, until April, 1914, seized and occupied Vera Cruz on Apr. 21, 1914, after President Huerta's refusal to salute the American flag. Admiral Fletcher was appointed commander-in-chief of the Atlantic Fleet in September, 1914. During the World War he served on the war industries board of the council of national defense, 1917, and also on the general board of the navy and the joint army-and-navy board. In 1925 he was appointed to President Coolidge's air craft board. As a result of his experience in active service, Admiral Fletcher invented a number of firing mechanisms, including a gun mount, and a rapid breech-closer. He was awarded the medal of honor for distinguished conduct in battle, and also the Distinguished Service Medal. He retired from active service, Nov. 23, 1919.

FLONZALEY QUARTET. See **MUSIC**.

FLOOD, WILLIAM HENRY GRATTAN. An Irish organist and musicologist, died at Enniscorthy,

Wexford, August 6. He was born at Lismore, Nov. 1, 1859. Chiefly self-taught in music, he began his career as organist in Dublin, in 1877. The following year, after a few lessons from Sir R. Stewart, he became organist of the Pro-Cathedral in Belfast. In 1882 he was called to Thurles Cathedral, and also became professor of music at the Jesuit College in Tullabeg. From 1890-94 he was professor of music and classical languages at St. Wilfred's College, Staffordshire. In 1895 he was elected organist of the Cathedral at Enniscorthy, a position which he filled with distinction until his death. He wrote *History of Irish Music* (1895), *Story of the Harp* (1905), *Story of the Bagpipe* (1911), *Memoir of W. V. Wallace* (1912), and also *John Field, Inventor of the Nocturne* (1920).

FLOODS. The year 1928, as was expected, witnessed the prompt proposal of measures of relief for the two great areas subjected to flood in 1927. The Mississippi plans were actually under way with an appropriation of \$325,000,000. At the close of the year, an ingenious scheme was submitted for meeting the Vermont problem which promised a large measure of security from a repetition of this disaster. Few remarkable floods were experienced during the year, perhaps the most notable being the London experience which exceeded by 11 inches any flood in the 265 years of such records.

MISSISSIPPI RIVER FLOOD CONTROL. Following the disastrous flood of 1927, plans were proposed both by the Mississippi River Commission and by the Chief of Engineers of the Army. As far as physical characteristics were concerned, the reports differed but little, whereas in estimate of cost the former was \$775,000,000 while the latter was only \$296,400,000. The principal differences were in allowance for higher and more extensive levees, etc., and in an estimate for damages for private property taken for the work and for which the Army Engineers made no allowance.

Throughout the year Mississippi Flood Control continued to be discussed by engineers and others. Engineers in general confined their statements to the need for careful consideration of the problem rather than any quick acceptance of plans, and to urging civilian engineering representation on the flood commission, instead of leaving the matter entirely in the hands of government and military engineers. There was also much discussion as to whether the work should be paid for by the Federal Government or by the States immediately concerned.

The Mississippi problem was probably not only the greatest engineering work ever faced by any nation, involving as it does 31 States and 20,000 square miles of territory, but it was an extremely difficult and complicated problem. While the levees already built had prevented much of the former inundations due to ordinary floods, the flood of 1927, the greatest on record, made it clear that they do not provide a sufficient channel, a large enough cross-section, to carry off the highest floods. Some twenty major crevasses or breaks in the levees occurred during the 1927 flood and many square miles were inundated.

Widening the main river channel to peak load capacity is out of the question financially, due to the fact that to move the levees back a few miles would involve taking the most valuable

river lands and would also require great and costly works. Such a plan would leave normal flow to clog with silt and deposit a channel which would be seldom full. Storage reservoirs may offer a means of reducing the peak-flood discharge of some of the five tributaries of the great river, but all plans so far proposed are based on providing what may be termed flood relief channels outside the present channel as defined by existing banks or levees. In this way normal floods will be kept within present channel lines while floods requiring additional channel section will be spilled into relief channels. The need for careful studies to determine flood possibilities from various combinations of floods from the tributaries of the river, economic considerations as regards the conditions in the various territories to be benefited, and the selection of locations so as to conserve the areas of greatest economic value make the problem very complicated and in addition there is always present the question of the reduction of the capacity of the channel in the course of time by silting, exact data on which are lacking. It would appear that the main plan must, as already noted, involve deliberately restoring the natural floodway of the Tensas and Atchafalaya rivers as a means of flood relief.

Final action was taken when President Coolidge signed the Jones-Reid Bill on May 15, providing for flood relief and carrying an appropriation of \$325,000,000. The work will be prosecuted by the Mississippi River Commission under the direction of the Secretary of War and Chief of Engineers. While in general the plan proposed by the Chief of Engineers was adopted, a special committee consisting of the Chief of Engineers, the President of the Mississippi River Commission, and a civilian engineer, was appointed to consider the different reports and to recommend action to the President, who was given authority to decide the matter. The work includes the section from the Head of the Passes at the delta to Cape Girardeau, Missouri. The bill stated that the States having spent large sums in providing previous levee constructions which failed, the cost of the new work would be met by the Federal Government. Thus a new era of Federal activity in the field of flood prevention was inaugurated.

While General Jadwin was Chief of Engineers and C. W. Sturtevant was appointed as civilian engineer to the board of review, the president of the Mississippi River Commission, Colonel Potter, who was, of course, thoroughly familiar with the plans of that commission, was abruptly retired on June 11, and Col. T. H. Jackson of the Engineer Corps was appointed to succeed him. This action aroused much unfavorable comment. Gen. Potter's advice was considered of vital importance, but his sudden death on August 6 ended the controversy.

VERMONT FLOOD RELIEF. In order to prevent a recurrence of the Vermont Flood of 1927 (see 1927 YEAR BOOK), causing the loss of 84 lives and over \$30,000,000 damage, it was proposed to construct storage reservoirs which will serve the dual purpose of power storage and flood retention. A committee appointed by the governor in March, 1928, submitted plans for five water-sheds—the White, Winoski, Lamaille, Missisquoi, and Passumpsic—and recommends that the study of this plan be continued to cover all rivers within the State.

Briefly, the commission pointed out that the financial situation in Vermont was such that reservoirs for flood retention alone, such as were used in the Miami works in Ohio, are economically impossible. On the other hand estimates are given showing that reservoirs for power purposes can be built to supply, for the five rivers mentioned, some 280,000 horse power—far beyond any present market needs. The experience on the Deerfield River in 1927 showed that such reservoirs, usually at low level in the fall when floods occur and hence capable of storing considerable flood flow, were a very effective means of reducing flood discharge. The removal of a number of encroachments which obstruct river channels also was recommended and it was especially noted that the reservoirs must be under competent control and operation as spring floods are not infrequent and, should a flood occur with reservoirs full, the effect of storage in reducing the maximum flood rate would be lost.

LONDON FLOOD. A tidal wave or bore in the Thames Estuary was generally accepted as the cause of a flood which broke over the Thames Embankment at London and did considerable damage as well as caused some loss of life on January 6-7, 1928. This was the first time such a bore had ever been recorded at London and was the highest water level ever recorded. A barrage across the Thames below the city, which would have prevented such a disaster, was dismissed in 1906 as impractical and some additions to the embankment probably would be made.

THE SACRAMENTO VALLEY FLOOD OF MARCH, 1928. Heavy rains during March 23-27 over the watersheds of the Sacramento River and its tributaries, especially the American River Basin, resulted in rapid rises of the rivers of the region, followed by widespread floods. On the 25th the unprecedented stage of 40 feet was reported from the junction of the middle and north forks of the American, while at Folsom the American crested at 26.8 feet, equalling the record of March, 1907; North Sacramento became inundated on March 25, and on the 26th the river at Sacramento crested only one-tenth foot below the highest stage ever recorded since the great floods of 1862; by the 26th, large areas of cultivated land in the Sacramento Valley were under water.

The floods in the Sacramento River and in some of the Feather-Yuba sections did not equal those of March, 1907, and January, 1909; and those in the Mokelumne-Cosumnes were far less serious than the San Joaquin Valley floods of 1911; but the American rose higher than since 1862. All streams had fallen to safe stages by March 29.

The floods would have been far more destructive than they were except that there was no snow in the mountains save at extreme altitudes, and even there it was less than normal; in fact, this was the first destructive flood known to occur in the central valleys of California to which snow water did not largely contribute. The damage at North Sacramento was over \$100,000; the levees protecting Sacramento held, and no overflow took place there. The total damage caused by these floods is estimated to have been nearly \$740,000.

OTHER FLOODS OF 1928. As a result of the unusually heavy rainfall in June east of the

100th meridian, floods occurred over most of the eastern United States except New England and the Middle Atlantic States; they were mostly moderate, but the aggregate damage was large, particularly to prospective crops, while those in Missouri, Arkansas, and Oklahoma were quite severe, especially on the St. Francis River.

The rise of 1928 in the Mississippi River reached its maximum in July, with stages at several points exceeding previous records for so late in the season. Owing to the advanced state of crops, losses from overflow were very high, the total reported (in all likelihood incomplete) amounting to \$7,820,000. This included losses in the St. Francis Basin, parallel to the Mississippi in northeastern Arkansas, where the flood, already high from the rains of June, was considerably augmented by backwater from the Mississippi.

Heavy rains over the eastern and southeastern United States in August and September, occasioned by tropical storms, led to a number of remarkably severe floods, with high stages and great destruction, particularly in the Carolinas and in Georgia. The flood in the Altamaha system of Georgia was especially severe; on August 17, the Savannah River at Augusta, Ga.; reached the highest stage of record; and records were similarly broken during September at Elizabethtown, N. C., and at Conway, Mars Bluff, and Kingstree, S. C. The total damage reported reached nearly \$8,500,000.

Severe floods, particularly damaging to crops, occurred on two occasions in Kansas during 1928—the first, following the heavy rains of late July and early August, in the Smoky Hill, Solomon, and Saline basins; and the second as part of the more extensive mid-west floods of November. In the latter, the States of Missouri and Arkansas also suffered to some extent, though not so heavily as Kansas. The November rises resulted in losses of between two and three million dollars—principally in bridges, highways, and matured crops and eight lives were lost in Kansas.

In addition, the usual number of minor floods took place during the year.

LOSSES BY FLOOD IN THE UNITED STATES—1928

<i>Drainage</i>	<i>Reported losses ^a</i>	<i>Lives</i>
Atlantic	\$10,459,688	5
Gulf (except Mississippi River)	2,532,000	5
Mississippi (except Ohio River)	20,507,525	8
Ohio	9,579,150	4
Great Lakes	2,500	
Pacific	1,132,351	1
Total	\$44,167,214	23

^a Probably about 75 per cent of actual.

FLORIDA. POPULATION. A State census was taken in 1925. The result showed a total population of 1,263,549, compared with 968,470 by the fourteenth United States census of 1920, an increase of 295,079 in the five-year period. The estimated population of the State on July 1, 1928, was 1,411,000. The capital is Tallahassee.

AGRICULTURE. The following table gives the acreage, production, and value of the principal crops in 1927 and 1928:

Crop	Year	Acreage	Prod. bu.	Value
Corn	1928	607,000	7,491,000	\$7,891,000
	1927	573,000	7,449,000	7,226,000
Potatoes	1928	31,000	3,875,000	5,812,000
	1927	29,000	3,045,000	5,633,000
Sweet potatoes	1928	28,000	2,464,000	2,834,000
	1927	29,000	2,668,000	2,268,000
Cotton	1928	101,000	20,000 ^a	1,790,000
	1927	67,000	17,000 ^a	1,624,000
Tobacco	1928	12,000	9,221,000 ^b	2,687,000
	1927	8,800	8,228,000 ^b	2,865,000
Hay	1928	92,000	67,000 ^c	1,261,000
	1927	99,000	67,000 ^c	1,209,000
Peanuts	1928	44,000	25,300,000 ^d	1,068,000

Oranges	1928	12,000,000 ^d	25,800,000
	1927	8,200,000 ^d	32,800,000
Grapefruit	1928	8,000,000 ^d	20,400,000
	1927	7,200,000 ^d	22,320,000

^a bales, ^b pounds, ^c tons, ^d boxes.

MINERAL PRODUCTION. The output of phosphate rock, forming somewhat less than one-half of the entire mineral production of the State, was slightly less in 1926 than in the year previous, being 2,708,207 long tons in 1926, as against 2,929,964 in 1925; in value, \$8,683,508 for 1926 and for 1925 \$8,789,070. Florida continued to produce much the greater part of the phosphate rock of domestic origin. Stone production rose again sharply to 6,785,430 short tons in 1926, from 4,026,790 in 1925; in value, to \$7,411,506 for 1926, from \$4,687,107 for 1925. Sand and gravel were produced in 1926 to a total of \$1,483,757. Production of clay and clay products increased. Among the minor minerals titanium ores and zircon were actively produced. The mineral production of the State totaled, for 1926, \$19,700,522; for 1925, \$16,625,699.

FINANCE. Expenditures in the year ended June 30, 1927, as reported by the United States Department of Commerce, were: for maintenance and operation of governmental departments, \$14,210,985 (of which \$1,372,698 was aid to local education); for interest on debt, \$566,149; for permanent improvements, \$23,041,662; total, \$37,818,796 (of which \$22,252,223 was for highways, \$2,696,272 being for maintenance and \$19,555,951 for construction). Revenues were \$27,390,541. From property and special taxes, 20.9 per cent was derived; from departmental earnings and payments for officials' services, 7.9 per cent; from sale of licenses and from gasoline taxes, 57.7 per cent. Property valuation was \$786,054,528; State taxes levied thereon were \$5,926,584. Net State debt was nil, but the State was under contingent liability of \$10,250,000 for debts of the Everglades drainage district.

TRANSPORTATION. The total mileage of railroad line under operation on Jan. 1, 1928, was 5707.97. There were built in 1928, 25.40 miles of additional first track.

EDUCATION. A constitutional amendment, proposed in 1927, to abolish the limitation of millage tax rates for school purposes was brought before the voters of the State on Nov. 6, 1928, for their approval, and in accordance with the vote, the maximum tax limit as applying to the special-tax school districts was removed. A report on the educational survey of the State made in 1927-28 was published late in the year. The school-age population of the State, for the academic year 1926-27, was given as 469,416. There were enrolled in the public schools in that year 370,729 pupils; 332,396 being in elementary and 38,333 in high-school grades. Ex-

penditures for public school education in the State totaled \$37,918,357.92. Salaries of teachers averaged \$123.60 a month.

CHARITIES AND CORRECTIONS. Institutions of the State devoted to the care or custody of persons were not under centralized control of a single State administrative body in 1928. They included a prison farm, State hospital, industrial schools for boys and for girls, respectively, a farm colony for the feeble-minded and epileptic, and a school for the deaf and the blind. The Farm Colony for the Epileptic and Feeble-Minded had on Jan. 1, 1928, 311 patients, their number being 22.4 to the 100,000 of the estimated population of the State.

POLITICAL AND OTHER EVENTS. The Tamiami Trail, a hard-surfaced motor highway 30 feet broad running through the Everglades from Tampa to Miami, was formally opened April 25, as a toll-free thoroughfare. In traversing the Everglades, where serious road-building difficulties were overcome, it opened up a large body of previously inaccessible marsh land to drainage and agricultural development. Its opening completed a belt of highway encircling the entire State. The Overseas Highway, a road between Miami and Key West, was opened on March 3. Pensacola became the terminus of a railroad route from Kansas City opened by the St. Louis and San Francisco system in June. Experiments with the cultivation of sugar cane, conducted by the Dahlberg interests at Clewiston on the south shore of Lake Okeechobee for three years, were reported in March to have produced satisfactory yields of a cane higher in sucrose content than that of Louisiana or of Cuba, the yield running as high as 60 or 80 tons of cane to the acre. Some 7000 acres were reported as under preparation for additional planting. The Florida Supreme Court in February declared invalid an act of the legislature of 1927 providing for an issue of bonds for the State purchase of the Connors Highway across the Everglades. Governor Martin's plan to finance drainage of the Everglades by the issue of \$20,000,000 of bonds to be issued under an act of 1927 by the Everglades Drainage District was upheld on March 27, by the State Supreme Court, but other litigation against the plan developed, and the proposed issue of bonds was postponed. The correction of the situation left by the cessation of the real estate speculations of 1926 continued during the year. A temporary default on certain of the obligations of the City of Lake Worth was reported in February. Banks with an important total of deposits closed at West Palm Beach in June; a large building association closed at Miami in January, involving three banks in that city. A memorial tablet to Pedro Mendez, offered by the State of Florida, was dedicated at Aviles, Spain, in July.

The West Indian hurricane of September 12-14 passed into southern Florida, where it occasioned the most severe calamity of the year within the continental United States, in respect of loss of life. The waters of Lake Okeechobee were swept over neighboring settled lowland, notably in the vicinity of Pelican Bay. Estimates of the local Red Cross organization placed the total hurricane mortality in the State at about 2300; the greater number of the victims were drowned in the Okeechobee area. Damage to the growing citrus crops was severe. In other

respects the material damage done was less than that occasioned by the hurricane of 1926. The American Red Cross administered relief in the stricken region.

ELECTION. The State rendered a majority of considerable proportions in the popular election of November 6 for the Republican National candidates, Hoover and Curtis. The popular presidential vote as officially reported was: Hoover (Rep.), 144,168; Smith (Dem.), 101,764. Florida in consequence named six Republican electors, this being the first occasion since 1876 on which the State had elected a block of Republican electors. Several members of the State delegation at the Democratic National Convention bolted the party nominee, Gov. Alfred E. Smith and campaigned against him. Organizations of what were known as Hoover Democrats were active in the State in the campaign, urging the defeat of Smith and the support of the Democratic State ticket. Doyle E. Carlton, the Democratic nominee, was elected governor, leading his opponent, the Republican candidate, William J. Howey, by a somewhat greater plurality than that for Hoover. United States Senator Park Trammell, Democrat, was reelected, and four Democrats were sent to the House of Representatives, three being the incumbents and the fourth, Mrs. Ruth Bryan Owen, daughter of William Jennings Bryan. Howey, the Republican candidate for Governor, obtained votes enough to win his party the right, which it had not previously held under the State election law, to hold a primary election in the next following governorship year.

OFFICERS. Governor, John W. Martin; Secretary of State, H. Clay Crawford; Treasurer, W. V. Knott; Attorney-General, Fred H. Davis; Comptroller, Ernest Amos; Superintendent of Public Instruction, W. S. Cawthon; Commissioner of Agriculture, Nathan Mayo.

JUDICIARY. Supreme Court: W. H. Ellis, Chief Justice; Associate Justices, James B. Whitfield, Armstead Brown, Glenn Terrell, Rivers H. Buford, L. W. Strum.

FLORIDA, UNIVERSITY OF. A State institution of higher education for men, at Gainesville, Florida; founded in 1905. In the autumn of 1928 the total registration totaled 2155, distributed as follows: Arts and sciences, 586; commerce and journalism, 373; engineering and architecture, 341; teachers, 315; law, 252; agriculture, 151; graduate, 82; and pharmacy, 62. The summer school session of 1928 had a registration of 1683 men and women. The faculty in the autumn of 1928 numbered 150 (exclusive of student assistants and research men). The financial condition was as follows: Operat-

ing and maintenance, \$789,122; and annual endowment, \$10,000. The library contained 59,122 volumes. A dormitory with 179 rooms was under construction at a cost of \$150,000. John James Tigert, LL.D., United States Commissioner of Education, resigned on September 1, 1928, to become president of the University of Florida, to succeed Albert Alexander Murphree, LL.D., who died suddenly in December, 1927.

FOLGER, WILLIAM MAYHEW. Rear admiral, United States Navy, retired, died at Cornish, N. H., July 23. He was born at Massillon, Ohio, May 19, 1844, and was graduated from the United States Naval Academy in 1864. He saw service in the closing months of the Civil War, in the Union navy. After serving in the various lower grades he became captain in 1898 and rear admiral in 1904. His commands included the *Quinnebaug* (1887-88), the *Yorktown* (1894-95), the *New Orleans* (1898-99), and the *Kearsarge* (1900-01). He was inspector of ordnance at the Washington Navy Yard, 1888-90, chief of the Bureau of Ordnance, with the rank of commodore, 1890-93, and lighthouse inspector, 1896-98 and 1901-04. He also commanded the Philippine squadron in 1898, and until 1905 the cruiser squadron of the Asiatic fleet. He commanded the Asiatic fleet at the time of his retirement in 1905.

FOOD AND NUTRITION. FOOD PRICES.

United States. The index number for wholesale prices of food reported by the Bureau of Labor Statistics, U. S. Department of Labor (*Mo. Labor Rev.*, vol. 27, p. 236) was 106.9 for September and 102.3 for October, 1928, an appreciable increase over the corresponding figures of 96.5 and 100 for 1927 (1926 = 100). *Bradstreet's* food index number based on the wholesale prices per pound of 31 articles for food was \$3.29 for the week ended December 22, as compared with \$3.30 for the preceding week, and \$3.38 for the week ended Dec. 24, 1927. Combined retail food prices as shown by the Bureau of Labor Statistics' logarithmic curve of monthly prices of 43 articles of food were slightly lower than for corresponding periods of 1927 through July. The August and September figures were higher and the October value practically the same as the corresponding 1927 figures. Of the

individual food items, increases of 1 per cent or more on October 15 as compared with October 15, 1927, were shown for 17, and decreases for 19, of the individual food items. Increases in the retail prices of the five cuts of beef included in the list varied from 15 per cent for sirloin steak and rib roast to 32 per cent for plate beef. In contrast with this, there was a 9 per cent decrease in pork chops and 3 per cent in bacon. Other items showing a considerable increase were oranges, 11, onions, 22, and navy beans, 30, per cent. The principal decrease was one of 27 per cent in potatoes.

OTHER COUNTRIES. The general trend of retail food prices throughout the world may be seen from the accompanying table compiled from data reported in the *Federal Reserve Bulletin* of December, 1928 (p. 859). The index numbers, shown on the preceding page, which have been constructed by the various foreign statistical offices, are based on the prices of a number of articles of food weighed according to different standards, but unless otherwise noted referable to the original pre-war basis of 100.

NUTRITION INVESTIGATIONS. Factors affecting basal metabolism. The nutrition laboratory of the Carnegie Institution, Boston, continuing its extensive programme of metabolism research, published during the year a number of important papers. Supplementing normal basal metabolism data published in 1919, Benedict (*Am. J. Physiol.*, vol. 85, p. 607) reported additional data for 27 men from 21 to 89 years of age and 33 women from 18 to 58 years of age. The data showed lower averages for both men and women than those of the earlier series. The greatest discrepancies from the various standards were found in individuals of unusual configuration, suggesting the need for great care in the interpretation of basal metabolism findings for determining medical or surgical treatment in subjects of unusual shape or size. The metabolism of the oldest male subject, a well-known surgeon in excellent physical and mental health, was much higher than the predictions for his age, suggesting a relationship between extraordinary physical well-being and super-normal metabolism. In another paper, Benedict (*Am. J. Physiol.*, vol. 85, p. 650) reported basal metabolism data for four subjects over periods of many years, showing a gradual decrease in metabolism with advancing age.

Monthly observations for over a year by Gustafson and Benedict (*Am. J. Physiol.*, vol. 86, p. 43) of the basal metabolism of a group of Wellesley College students showed a tendency toward low values in winter, followed by a rise to higher levels during the spring and summer. The month to month variations in the same subjects were considerable.

The possible effect upon basal metabolism of a summer vacation was investigated by Benedict and Finn (*Am. J. Physiol.*, vol. 85, p. 665) through basal metabolism determinations on members of the staff of the nutrition laboratory before and after the summer vacation of one month. Contrary to what might be expected, there was no appreciable difference in metabolism before or after vacation in all but two of the 20 individuals studied.

A greatly simplified form of portable respiration apparatus was developed by Benedict (*Bos-*

ton Med. Surg. J. vol. 197, p. 1161) for use in an extensive investigation of racial metabolism in various parts of the world. With the use of this type of apparatus, Steggerda and Benedict (*Am. J. Physiol.*, vol. 85, p. 621) found the basal metabolism of brown and black subjects in Jamaica, British West Indies, to be very close to, although slightly below, the prediction standards for white subjects of corresponding age, weight, and height in temperate zones, thus suggesting the probability that the climate and diet in this place has no appreciable effect upon heat production.

A more extensive series of measurements on male Mayas, workers in the archaeological excavations at Chichen Itzá, Yucatan, and on white members of the expedition before, during, and after a short stay at Yucatan, was reported by Williams and Benedict (*Am. J. Physiol.*, vol. 85, p. 634). The measurements on the white subjects showed that the subtropical climate had not affected their metabolism. The average basal metabolism of the native subjects was 5.2 per cent above the standards for white subjects. The high values were considered of particular significance inasmuch as there had been a tendency to associate definitely low metabolism of various races with racial inferiority. This would appear unwarranted inasmuch as the civilization of the Mayas is low in comparison with that of Orientals whose basal metabolism is low.

NUTRITION AND GROWTH OF CHILDREN. A comparison by Orr (*Brit. Med. J.* No. 3499, p. 140) of the relative value of whole milk, separated milk, and crackers as supplementary school lunches as shown by the growth records for 7 months of groups of children from 5 to 14 years old in seven cities and large towns in Scotland and Ireland showed no benefit from the crackers, but marked increase in growth and noticeable improvement in the general condition of the children in the groups receiving either whole milk or separated milk. The beneficial results with separated milk were considered of special interest.

A study by Davies (*Mass. Agr. Expt. Sta. Bull.*, 241) of the dietary habits and nutritional status of elementary rural-school children in two sections of Massachusetts revealed the fact that the teeth of the children in the dairy-farming section where the milk consumption was relatively high were in much better condition than of those in the cranberry-growing section where the milk consumption was low but the consumption of fresh fruit and vegetables higher than in the other section.

The careful supervision of the diet of diabetic children in connection with insulin therapy afforded the opportunity to study the growth and nutritive condition of children under favorable dietary management. A study by Boyd and Nelson at the State University of Iowa College of Medicine (*Am. J. Diseases Children*, vol. 35, p. 753) of the height and weight gains for periods of from 3 months to 4½ years of 32 diabetic children showed the growth response of these children to be greater than that of the so-called superior groups of non-diabetic children under less careful dietary supervision. Moreover, Boyd and Drain (*J. Am. Med. Assoc.* vol. 90, p. 1867)

found that all of the 28 children who had been under dietary treatment for 6 months or more showed arrested caries, although before the dietary treatment began the caries was definitely progressive. These findings were considered of significance in indicating the dependence of dental caries in children on recent dietary inadequacies and the possibility of checking or preventing caries by adequate diets such as followed in the dietary control of diabetes.

As a part of a long-continued investigation at the Nelson Morris Memorial Institute for Medical Research of the Michael Reese Hospital, Chicago, to determine whether occasional failures to gain in special nutrition work with undernourished children are due to metabolic abnormalities, Wang, Kaucher, and Frank (*Am. J. Diseases Children*, vol. 35, p. 856) compared the calcium metabolism of 10 normal and 50 undernourished children from 4 to 13 years of age, but found no appreciable differences between the groups. A similar comparison by Wang, Hawks, and Hays (*Am. J. Diseases Children*, vol. 35, p. 968) of the protein metabolism of normal and undernourished children led to the conclusion that the undernourished child is able to absorb and store nitrogen at a rate equal to or greater than the normal child of the same weight and that consequently the protein requirement for such children should be calculated in terms of the standard weight for age of the child rather than its actual weight.

NUTRITIONAL ANÆMIAS. At the Wisconsin Agricultural Experiment Station, the important discovery was made that, for the proper functioning of iron in hemoglobin formation and the prevention or cure of secondary anemia, traces of copper are necessary. Earlier studies by Hart *et al.* (*J. Biol. Chem.*, vol. 65, p. 67) had shown that, in rabbits rendered anemic by a whole-milk diet, an inorganic source of iron such as ferric oxide was incapable of curing the anemia by itself, but was very effective when supplemented by fresh cabbage or corn meal or iron-free extracts of these materials. This suggested the possibility that some factor other than iron is needed for hemoglobin formation. As all of the known factors except vitamin E could be ruled out, lettuce, a good source of this vitamin, was tested (*J. Biol. Chem.*, vol. 72, p. 299) with favorable results. However, the ash of lettuce was equally effective, showing that the unknown factor must be inorganic. The clue to its identity was found in the observation (*J. Biol. Chem.*, vol. 77, p. 797) that extracts of the ashed material had a slight bluish tinge suggesting copper.

Following this clue, the Wisconsin workers were able to cure nutritional anemia in rats by the simple addition to the whole-milk diet on which the anemia had been induced, of 0.5 mg. daily of iron as ferric chloride and as small an amount as 0.05 mg. of copper as copper sulphate. This discovery received unfortunate newspaper publicity and copper was widely heralded as the cure for any kind of anemia in spite of the fact that no claim was made for it except as a supplement to iron in the type of experimental anemia caused by an exclusive milk diet. Whipple and co-workers, using dogs in which severe anemia had been produced by repeated bleedings, also reported favorable results in the feeding of inorganic ash of various food materials including liver, kidney, and apri-

cots (*J. Biol. Chem.*, vol. 79, p. 563), all of which contain both copper and iron, but in the use of copper and iron salts (*J. Biol. Chem.*, vol. 79, p. 577) did not invariably get better results with the combination of the two than with iron alone. They were of the opinion that in the type of anemia with which they were working a group of substances was responsible for the increased hemoglobin production.

Additional evidence of the specificity of liver and liver extracts in the treatment of pernicious anemia was presented in a symposium on anemias at the annual meeting of the American Medical Association at Minneapolis, Minn., June 13, 1928. Middleton (*J. Amer. Med. Assoc.*, vol. 91, p. 859) reporting on the treatment of 40 cases of secondary anemia with Minot-Murphy liver diet, stated that although 14 responded favorably, it was demonstrated that the response was not due to the specific factor in the liver. Solutions of iron and copper salts in amounts equivalent to what would be contained in a 24-hour dosage of liver extract were without effect in two cases of pernicious anemia. Middleton urged that the indiscriminate use of liver for all types of anemia be discouraged in order to conserve the supply for patients with pernicious anemia.

VITAMINS. Vitamin A and infection. Studies reported from various laboratories strengthened the opinion that the absence of vitamin A leads to the breaking down of epithelial tissues throughout the body, with a resulting decrease in resistance to infection. The characteristic eye infection long thought to be the chief pathological symptom of vitamin A deficiency was shown by Green and Mellanby (*Brit. Med. J.*, 1928, No. 3537, p. 691) to be of less frequent occurrence in rats than abscesses at the base of the tongue, while pyogenic infections of the alimentary tract, kidney, and bladder and stones in the bladder were of frequent occurrence. They suggested that the term "anti-infective" might well be applied to vitamin A, lack of which in their opinion may be the cause of some of the common inflammatory and suppurative processes found in man.

Vitamins F (B_1) and G (B_2). No uniformity was reached during the year concerning the nomenclature of the two separate vitamins now known to be present in what was formerly called vitamin B. British scientists applied the term B_1 to the antineuritic vitamin, and B_2 to the relatively heat-stable vitamin sometimes known as the antipellagra vitamin. In the United States an increasing tendency was shown to use F and G for these two factors, respectively. Salmon, Guarrant, and Hays continued their attempts to obtain pure fractions of each of these (*J. Biol. Chem.*, vol. 73, p. 787) and with the help of these fractions made an elaborate study of the etiology of experimental pellagra in rats (*J. Infect. Diseases*, vol. 43, p. 426). They were able not only to demonstrate in rats on a diet lacking only the heat-stable vitamin G a condition resembling human pellagra in the bilateral symmetry of the skin lesions but also to isolate from the external and internal lesions a microorganism which, while nonpathogenic under ordinary conditions, produced the characteristic pellagra-like condition when fed in massive doses. The protective factor brought about a rapid cure in these animals and was also able to inhibit the growth of the organism in culture

medium. This would suggest that the pellagra-like condition in rats is not the result of a dietary deficiency alone, but that in the absence of the protective factor the body loses its resistance to a comparatively nonpathogenic organism. Findlay (*J. Path. Bact.*, vol. 31, p. 353) and Chick and Roscoe (*Biochem. J.*, vol. 22, p. 790) also described a pellagra-like condition induced in rats by diets deficient in the heat-stable factor of vitamin B.

Vitamin D. Interest in irradiation and the use of irradiated ergosterol in the prevention and cure of rickets continued. Hess and Lewis (*J. Am. Med. Assoc.*, vol. 91, p. 783) reported unflinching success in the cure of rickets with irradiated ergosterol and suggested that its action on calcium metabolism may be of the nature of a stimulant for the parathyroid gland. In their opinion there had not been sufficient clinical evidence to define the proper dosage, but the doses that were reported to be harmful were at least 10,000 times the normal curative dose.

That window glass capable of transmitting the effective light rays may not be a practical means to employ for the prevention and cure of rickets was shown by Coblenz (*Trans. Illum. Engin. Soc.*, vol. 23, p. 247) and Clark (*Science*, vol. 68, p. 165). The former, reporting data obtained at the U. S. Bureau of Standards on the transmissibility of various light sources, expressed the opinion that the installation of special glass in private homes and offices was an unwarranted expense. Clark stated that any child going out for recess or any stenographer going out to lunch would get more ultra-violet radiation than could be obtained all day behind a window of ultra-violet transmitting glass.

BIBLIOGRAPHY. Important books of the year were: W. H. Eddy, *Nutrition* (Baltimore); M. Fishbein et al., *Your Weight and How to Control It* (New York); L. F. Cooper, E. M. Barber, and H. S. Mitchell, *Nutrition in Health and Disease for Nurses* (Philadelphia); E. G. Halliday and I. T. Noble, *How and Whys of Cooking* (Chicago); G. Lusk, *The Elements of the Science of Nutrition* (4th ed., Philadelphia); and C. O. Swanson, *Wheat Flour and Diet* (New York).

FOOT AND MOUTH DISEASE. See VETERINARY MEDICINE.

FOOTBALL. Football again in 1928 gave most convincing proof that it was preëminent among college sports. It was estimated that some 35,000,000 persons attended the various college and school games throughout the United States, the enthusiasm being of the same high calibre in every section. More than 88,000 witnessed the battle between the United States Military Academy and Stanford University at the Yankee Stadium, New York City, on December 1. Nearly 90,000 saw the contest between Stanford and the University of California on the Pacific coast. Crowds of 70,000 and 80,000 were fairly common at games played by the various Conference colleges of the Mid-West. The big games of the South and Southwest drew from 35,000 to 40,000 spectators. Probably \$60,000,000 was realized in gate receipts during the season.

The selection of a championship college eleven is, of course, an impossibility as the schedule of each is so arranged that one, or at the most two games, afford the season's goal. In other words, certain rivals are "pointed" for by the coaches and trainers. There is no doubt, how-

ever, that the University of Southern California had one of the most perfect gridiron machines in the college world. The "Trojans," as they were called, played through an exceptionally severe schedule without suffering defeat, the only blot on their record having been a scoreless tie with the University of California. Among the Eastern elevens of note were United States Military Academy, New York University, Carnegie Institute of Technology, Pennsylvania, Boston College, and Villanova. In the South, Georgia Institute of Technology and Tennessee held sway, while in the Southwest, Texas University and Southern Methodist stood out. Illinois won the mid-West Conference for the second year in succession and rated, along with Wisconsin, as an eleven of unusual strength.

A summary of the games played by the leading colleges follows:

Southern California 40, Utah Aggies 12; Southern California 19, Oregon State 0; Southern California 19, St. Mary's 6; Southern California 0, California 0; Southern California 19, Occidental 0; Southern California 10, Stanford 0; Southern California 78, Arizona 7; Southern California 27, Washington State 13; Southern California 28, Idaho 7; Southern California 27, Notre Dame 14.

U. S. Military Academy (Army) 35, Boston University 0; Army 14, Southern Methodist 13; Army 44, Providence 0; Army 15, Harvard 0; Army 18, Yale 6; Army 88, De Pauw 12; Army 6, Notre Dame 12; Army 32, Carleton 7; Army 13, Nebraska 3; Army 0, Stanford 26.

New York University 21, Niagara 0; New York University 26, West Virginia Wesleyan 7; New York University 34, Fordham 7; New York University 48, Rutgers 0; New York University 47, Colgate 6; New York University 2, Georgetown 7; New York University 71, Alfred 0; New York University 27, Missouri 6; New York University 27, Carnegie Tech. 13; New York University 13, Oregon State 25.

Carnegie Tech. 32, Westminster 6; Carnegie Tech. 65; Ashland 0; Carnegie Tech. 45, Thiel 13; Carnegie Tech. 19, Washington and Jefferson 0; Carnegie Tech. 6, Pittsburgh 0; Carnegie Tech. 13, Georgetown 0; Carnegie Tech. 27, Notre Dame 7; Carnegie Tech. 13, New York University 27.

Pennsylvania 34, Ursinus 0; Pennsylvania 46, Franklin and Marshall 0; Pennsylvania 67, Swarthmore 0; Pennsylvania 14, Penn State 0; Pennsylvania 0, Navy 6; Pennsylvania 20, Chicago 13; Pennsylvania 7, Harvard 0; Pennsylvania 20, Chicago 13; Pennsylvania 7, Harvard 0; Pennsylvania 34, Columbia 7; Pennsylvania 49, Cornell 0.

Boston College 38, Catholic University 6; Boston 6, Navy 0; Boston 19, Duke 0; Boston 27, Boston University 0; Boston 60, Manhattan 6; Boston 19, Fordham 7; Boston 24, Canisius 0; Boston 51, Connecticut Aggies 13; Boston 19, Holy Cross 0.

Georgia Tech. 13, Virginia Military Institute 0; Georgia Tech. 12, Tulane 0; Georgia Tech. 13, Notre Dame 0; Georgia Tech. 20, North Carolina 7; Georgia Tech. 32, Oglethorpe 7; Georgia Tech. 19, Vanderbilt 7; Georgia Tech. 33, Alabama 13; Georgia Tech. 51, Auburn 0; Georgia Tech. 20, Georgia University 6.

Tennessee 41, Maryville 0; Tennessee 41, Centre 7; Tennessee 13, Mississippi 12; Tennessee 15, Alabama 13; Tennessee 26, Washington and Lee 7; Tennessee 57, Carson-Newman 0; Tennessee 37, Sewanee 0; Tennessee 6, Vanderbilt 0; Tennessee 0, Kentucky 0; Tennessee 13, Florida 12.

Texas 32, St. Edward's 0; Texas 12, Texas Tech. 0; Texas 12, Vanderbilt 13; Texas 20, Arkansas 7; Texas 13, Rice 6; Texas 2, Southern Methodist 6; Texas 6, Baylor 0; Texas 6, Texas Christian 0; Texas 19, Texas Aggies 0.

Southern Methodist 33, Denton Normal 0; Southern Methodist 31, Howard Payne 0; Southern Methodist 13, Army 14; Southern Methodist 6, Simmons 0; Southern Methodist 53, Rice 13; Southern Methodist 60, Trinity 7; Southern Methodist 6, Texas 2; Southern Methodist 19, Texas Aggies 19; Southern Methodist 0, Baylor 2; Southern Methodist 6, Texas Christian 15.

Illinois 33, Bradley 6; Illinois 31, Coe 0; Illinois 13, Indiana 7; Illinois 6, Northwestern 0; Illinois 0, Michigan 3; Illinois 14, Butler 0; Illinois 40, Chicago 0; Illinois 8, Ohio State 0.

Wisconsin 22, Notre Dame 0; Wisconsin 13, North Dakota Aggies 0; Wisconsin 19, Purdue 19; Wisconsin 7, Michigan 0; Wisconsin 25, Chicago 0; Wisconsin

15, Alabama 0; Wisconsin 13, Iowa 0; Wisconsin 0, Minnesota 6.

California 22, Santa Clara 0; California 7, St. Mary's 0; California 13, Washington State 3; California 0, Southern California 0; California 13, Oregon 0; California 6, Washington 0; California 60, Nevada 0; California 13, Stanford 13.

Stanford 26, Oregon 12; Stanford 45, Southern California (S. B.) 7; Stanford 47, Idaho 0; Stanford 47, Fresno State 0; Stanford 0, Southern California 10; Stanford 31, Santa Clara 0; Stanford 12, Washington 0; Stanford 13, California 13; Stanford 26, U. S. Military Academy (Army) 0.

Professional football in the United States showed a somewhat larger attendance in 1928 than in previous years, but was still far from being a success financially. The championship was won by the Providence eleven with 8 victories, 1 defeat, and 2 ties. The other teams finished as follows: Frankford won 11, lost 3, tied 2; Detroit won 7, lost 2, tied 3; Green Bay won 6, lost 4, tied 3; Chicago Bears won 7, lost 5, tied 1; Giants won 4, lost 7, tied 2; Yankees won 2, lost 8; Chicago Cardinals won 1, lost 5; Dayton won 0 lost 7.

See SOCCER.

FORD, JAMES LAUREN. American author, editor, and critic, died at Bay Shore, N. Y., February 26. He was born at St. Louis, Mo., July 25, 1854, and received an academic education at Stockbridge, Mass. He moved early to New York City, where he held editorial positions on newspapers and periodicals, acting as editor, dramatic critic, literary critic, or special writer. He was a member of the editorial staff of the New York *Herald* (before its consolidation with the New York *Tribune*) for thirty years. He devoted much of his time and attention to the theatre, and was the author or adapter of two successful plays. His humorous writings were, for the most part, in the form of satirical comments on current tendencies and affections in American literature, drama, and life. His name was associated with the age that produced such American humorists as Marshall P. Wilder, Bill Nye, and John Kendrick Bangs. His writings included: *The Literary Shop and Other Tales* (1894; 3d ed., 1899); *Hypnotic Tales* (1894); *The Third Alarm* (1893; new ed., 1908); *Bohemia Invaded* (1895); *Dr. Dodd's School*; *Dolly Dillenback* (1895); *Cupid and the Footlights* (1899); *The Story of DuBarry* (1902); *The Brazen Calf* (1903); *The Wooing of Folly* (1906); *Waitful Watching* (1916); *Forty-Odd Years in the Literary Shop* (1921) and *Hot Corn Ike* (1923). He also edited, with his sister, Mary K. Ford, *Every Day in the Year* (1902; new ed., 1914), a rhymed epitome of world history.

FORDHAM UNIVERSITY. A Roman Catholic institution for higher education at Fordham, New York City; founded in 1841. It is the largest Catholic educational institution in America, and is under the Society of Jesus. The enrollment for 1928-29 totaled 7859 students, including 1269 in the teachers' college and 506 in the graduate school, and a distribution among the other colleges as follows: Law, 1465; pre-law, 175; college, 1336; business administration, 583; pharmacy, 464; social service, 137; preparatory school, 527. The registration for the summer school of 1928 was 1397. There were 212 faculty members. The endowment fund on June 30, 1928, amounted to \$113,040. There were 100,000 volumes in the library. A new faculty building was completed in November, 1928, which would accommodate 70;

and reconstruction work was done on the University Chapel to increase the seating capacity from 350 to 1200. President, the Rev. William J. Duane, S.J., Ph.D.

FOREIGN EXCHANGE. See FINANCIAL REVIEW.

FOREST DISEASES. See BOTANY.

FOREST FIRES. See FORESTRY.

FORESTRY. Marked by no outstanding event or no unusual conditions, the 1928 forestry year was normal and witnessed satisfactory progress in many directions. Commercial forest interests manifested a spirit of willingness to cooperate fully in the rational utilization and preservation of the forests. The United States Congress passed two highly significant measures—the McSweeney-McNary Law for the support and expansion of research activities, and the McNary-Woodruff Law, looking to increased purchase of forest land for the National forests. Forest fires exacted no abnormal tolls in 1928 and with improved roads and better fire-fighting organization and equipment, the future was conceded hopeful. State and Federal forest nurseries continued to produce increasing numbers of young forest trees for reforestation purposes. With replanting of idle forest lands and with a programme of adequate fire protection, leading foresters proclaimed that the United States can always be largely self-supporting in respect to lumber production.

THE NATIONAL FORESTS. The general interest in increasing the nationally owned forests was effectively crystallized in the important McNary-Woodruff Law, approved by President Coolidge on April 30, 1928, and laying down a financial programme for enlarged purchases of land for national forest purposes and protection of head waters of important rivers. The gross area of the national forests on June 30, 1928, was 184,403,819 acres, of which 24,922,963 was privately owned. The net area was thus 159,480,856 acres, a gain of 680,431 acres during the year. The cash receipts from the national forests during the same period amounted to well over five million dollars, the largest item of which was derived from the sale of timber. A considerable investment in the way of new roads and trails was justified both in the light of making the national forests accessible to the people and in facilitating fire protection. Efforts were continued in consolidating scattered areas, and in exchanging public property for privately owned areas located within the national forests, with a view to simplifying the management of the forests. An important purchase of 23,123 acres in the White Mountains of New Hampshire saved an exceptionally beautiful area from destructive lumbering and added and perpetuated it to public use as a recreational centre.

LUMBER PRODUCTION. Indications of a slight increase in total lumber production in 1928, as compared with that of 1927, was reported in late December, 1928, by the National Lumber Manufacturers Association, of Washington, D. C. This was especially significant in view of the improved manufacturing practices in the various lumber industries, which in themselves have exerted measurable savings in raw materials. Many of the larger lumber companies were planning to replant their various holdings with a view to sustained production. *The Forest Worker*, published by the United States Forest Serv-

ice, reported that one large company, founded in 1888, had marked its fortieth anniversary by adopting plans for keeping its forest lands continuously productive. Sustained production will promote a degree of stability that the lumber business has never enjoyed, making abandoned lumbering towns a relic of the past.

FORESTRY RESEARCH. From the viewpoint of the promotion of forestry research, 1928 was an outstanding year. The McSweeney-McNary Law, approved by President Coolidge on May 22, established and outlined a ten-year programme for forest research, and thus paved the way for an orderly and increasingly effective attack on the large number of important problems. The Secretary of Agriculture, Dr. William M. Jardine, described the McSweeney-McNary Act as "the most important piece of fundamental forestry legislation enacted since the Clarke-McNary Law of 1924." Under its provision the completion and maintenance of a series of 14 forest experiment stations was authorized. Most of these stations were already in operation and were beginning to yield constructive results. In accordance with the policy of locating these new forestry stations near established educational institutions, the recently authorized Allegheny Station was located at Philadelphia where it will work in coöperation with the University of Pennsylvania.

Significant of the spirit of the times, certain privately endowed institutions were actively engaged in forestry research. The Eddy Tree Breeding Station recently established at Placerville, Calif., undertook the breeding of forest trees with a view to developing faster-growing varieties. The New York Botanical Garden coöperated in experiments to develop, by plant breeding, fast-growing forms of poplar as sources of pulpwood. Various large educational institutions, such as Yale and Harvard universities, continued to make substantial contributions to forestry research.

The conservation and economical utilization of lumber and lumber products continued to receive serious consideration. The Forest Products Laboratory of the United States Forest Service developed two devices for quick determination of the moisture content of lumber, thus enabling rapid grading to a uniform degree of dryness. Pulpwood studies showed that aspen, birch, and maple may be cooked together and utilized in manufacturing strong pulps for cheaper paper and board. Furthermore, it was found that much of the sawmill and manufacturing waste may be utilized in preparing pulp.

FORESTRY EDUCATION. The American Forestry Association, assisted by the State forestry organizations of Florida, Georgia, and Mississippi, embarked on an ambitious educational programme to arouse public interest in the preservation and upbuilding of the pine forests of the South which are an important source of naval stores. This project, placed under the direction of W. C. McCormick, a forester with extended Southern experience, is hoped to convince the rural people of the wastefulness of annually burning the woodlands, a practice which not only prevents reproduction but also lowers the yield of the surviving trees.

Pursuing its policy of developing the School of Forestry to maximum usefulness, Yale University decided to grant the degree of doctor of philosophy in forestry. Practical forestry train-

ing received a decided impetus in the completion of a permanent new building at the New York State Ranger School at Wanakena, N. Y. This school, founded in 1913, as a branch of the New York College of Forestry, at Syracuse University, and the first of its kind in the United States, is devoted to the training of field personnel.

FOREST FIRES. According to the *Report of the Forester*, of the United States Department of Agriculture, for the year ended June 30, 1928, the 1928 fire season was unusually satisfactory. Rains in the northern Rocky Mountains and the northern Pacific States materially lessened the customary summer drought period. California again suffered severe losses, despite an earnest effort on the part of Federal and local agencies to keep fires in check. The importance of forest protection was recognized by the establishment of a national forest protection board composed of representatives of the Forest Service, National Park Service, Bureau of Indian Affairs, General Land Office, the Biological Survey, the Weather Bureau, the Bureau of Entomology, and the Bureau of Plant Industry. Coördination of effort has already begun to yield results. Of various modern devices used to report forest fires, the radio was tested to some extent during the year, but was found far from satisfactory due to various difficulties, such as the effect of topography on transmission of code and voice, and the absorption of radio energy by trees. The great cost of constructing telephone lines makes the improvement of radio communication highly desirable.

INSECTS AND DISEASES. Insects not only constituted a direct menace to timber but also indirectly caused serious fire hazards by increasing the dead timber. Serious outbreaks of bark beetles occurred in the Beaverhead National Forest in Montana and in the Modoc National Forest in California. The bark beetle was especially destructive to mature marketable timber. Lesser outbreaks of beetles occurred in National forests in Colorado, Arizona, and Oregon. White pine blister rust was observed for the first time in the national forests of northern Idaho, and brought forward the all-important question of abandoning the important pine timber to its fate or making a systematic campaign to remove the wild currants and gooseberries which serve as alternate host. Since there are approximately one and one-half million acres of valuable timber involved, foresters believed that decisive action should be taken to save the forests. Chestnut blight continued its devastating march through the southern Appalachian forests, and since no effective means of combating this disease are known, the chestnut trees appear doomed to speedy extinction. Larch canker, a newly introduced disease described as potentially destructive as chestnut blight, threatens not only the larch but also Douglas fir and perhaps Western yellow pine, and in the opinion of foresters must be controlled.

STATE AND MUNICIPAL FORESTS. That the States, counties, and towns recognized the desirability of community forests was evidenced in the activities of the year. New York State made notable additions to its already sizeable Adirondack and Catskill preserves. Pennsylvania purchased a total area of 172,740 acres—the largest annual increment since 1902. New Jersey, Indiana, Alabama, North Carolina, and Ver-

mont increased their State forest areas either by purchase or gift. The renowned Franconia Notch area in New Hampshire came into public ownership through the combined effort of the State and of 15,000 private contributors. The Town of Warner, New Hampshire, found that its forest of 800 acres was an important asset in profitable winter employment for its citizens. This increasing interest in community forests manifested the changing public attitude. The forests were being accepted in their true light as important assets in the national welfare.

MISCELLANEOUS. The resignation on May 1, of Col. William B. Greeley, chief of the Forest Service of the United States Department of Agriculture, to become Secretary-Manager for the West Coast Lumbermen's Association, was a distinct loss to the cause of National forestry. During the eight years of Colonel Greeley's leadership, great improvement was manifested in the relations between the Forest Service and commercial forestry interests—a condition which promoted the welfare of forestry in general. Colonel Greeley was succeeded by Maj. Robert Y. Stuart, chief of the Branch of Public Relations of the Forest Service.

The National Arboretum, authorized by the United States Congress and to be located within the District of Columbia, was expected to include every species of forest tree that could be grown in the region, and thus to serve as a living herbarium.

Will C. Barnes, assistant forester of the United States Department of Agriculture Forest Service, in charge of range management and popular magazine writer, retired from the Service on July 1, 1928. George H. Collingwood, extension forester of the United States Department of Agriculture, was appointed forester of the American Forestry Association on June 1, 1928, to succeed Shirley W. Allen, who resigned to become extension professor of forestry at the University of Michigan.

"Forest Week," April 22-28, 1928, was set apart by proclamation of President Coolidge. The chief opening address was delivered by Charles Stewart, Canadian Minister of the Interior. "Certified by Centuries of Service" won the \$5000 prize offered by the National Lumber Manufacturers Association of Washington, D. C., for an effective slogan to stimulate the use of wood.

FORESTS. NATIONAL. See **FORESTRY.**

FORMOSA or **TAIWAN.** An island belonging to Japan off the Chinese province of Fukien; formerly belonging to China but ceded to Japan, May 8, 1895. Area, 13,889 square miles; population, according to the census of 1925, 3,994,236, of whom 189,630 were Japanese and 33,258 foreigners. Capital, Taihoku, with a population of 195,555 in 1925. Other large towns are Tainan, Kagi, and Taichu. In 1926 there were 132 primary schools for the instruction of Japanese, with 773 teachers and 24,782 pupils; and for the instruction of the natives there were 523 schools with 5050 teachers and 220,120 pupils.

Formosa produces in commercial quantities nearly every tropical, subtropical, and temperate-zone product. The island supplies all the world's Oolong tea and produces nearly all the world's natural camphor. The sugar industry, however, is the most important. The production of raw sugar amounts to more than 1,000,000,000 pounds annually. The entire output is shipped to

Japan, with the exception of that used in local consumption and an inferior grade shipped to China. The production of tea averages about 21,000,000 pounds annually, of which the United States takes about 10,000,000 pounds. The yield of rice is over 25,000,000 bushels. The indigo, hemp, pineapple, grapefruit, papaya, peanut, bean, and cereal industries are also important producers. Gold, silver, and copper are mined in considerable quantities, and coal and sulphur are exported. The exports in 1927 were valued at 44,592,000 yen and the imports at 65,555,000 yen. The revenues and expenditures have grown enormously under Japanese rule and at the present time amount to about 100,000,000 yen annually. The budget has never shown a deficit. Revenues and expenditures for the fiscal year beginning Apr. 1, 1927, were estimated at 111,599,202 yen. The principal expenditures are for communications and transportation, for the management of the Government's monopolies, for forestry, and for maintenance of various administrative bureaus. The island is under a governor-general, who is supported by a well-organized force of Japanese police. Governor-general in 1928, Mitsunoshin Yamakami.

FRAMPTON, SIR GEORGE JAMES. English sculptor, died at London, May 21. Born in 1860, he studied at the Lambeth schools under W. S. Frith and at the Royal Academy schools, and at the latter won the gold medal and traveling scholarship, which enabled him to work in Paris under Mercié, in 1887. He studied also under the painter, Dagnan-Bouveret. His early pieces in marble and bronze were marked by sound technical ability, and won for him, at the early age of 34, an A.R.A., with full membership in the Royal Academy in 1902. After treating ideal subjects, beginning with "Socrates Teaching" (1884) and ending with "Children of the Wolf" (1892), he declared himself against "white sculpture," and devoted himself to color effects in all manner of material. Among his works of that period were "Mysteriarch," a female bust; a stately statue, "Dame Alice Owen," in bronze and marble; "Lamia," in bejeweled bronze and marble; and a youthful "St. George," mounted on an agate globe and with mother-of-pearl background. He excelled especially in purely decorative work; e.g., the terra-cotta façade of the Junior Constitutional Club, London; the sculptures of the Glasgow Art Gallery, and the remarkable bronze memorial to Charles Mitchell, shipbuilder, at Newcastles. Although primarily devoted to ideal and decorative sculpture, he modeled a number of portrait statues of great originality; among the best known are the colossal bronze Queen Victoria, Calcutta; the Edith Cavell Memorial, London; the statues of Queen Mary for Victoria Memorial Hall, Calcutta, and Government House, Delhi, and the portrait busts of King George and Queen Mary for the Guildhall, London. His "Peter Pan," in Kensington Gardens, has been highly praised. He was one of the most gifted and original sculptors that Great Britain has produced; his figures are highly suggestive of intellect and imagination and

show pathetic gravity of expression, but the designs sometimes lack unity. He was president of the Society of British Sculptors, 1911-12, and was knighted in 1908. He was an honorary associate, Royal Institute of British Architects; an honorary life member, Oxford Union Society; a past master of the Art Workers' Guild, and a member of the Royal Academy of Fine Arts, Milan.

FRANCE. A republic of western Europe, lying between 42°20' and 51°5' N. latitude and 7° 45' and 4°45' W. longitude. Capital, Paris.

AREA AND POPULATION. The area before the War was 207,054 square miles; total area in 1928, 212,659 square miles. The additions obtained under the Peace Treaty, and corresponding to Alsace-Lorraine under the German Empire, comprise the new departments of Bas-Rhin, 1848 square miles; Haut-Rhin, 1354 square miles; and Moselle, 2403 square miles. According to the census of 1926, the population was 40,743,851, but not including the military and naval forces and the crews of merchant ships abroad. The exclusions numbered 178,534 in 1926. The population in 1921 was 39,209,518. The cities with a population of over 200,000 at the census of 1926 were as follows: Paris 2,871,429; Marseilles, 652,196; Lyons, 570,840; Bordeaux, 256,026; and Lille, 201,921.

EDUCATION. Primary education is free and compulsory between the ages of 6 and 13. The latest available statistics (1924-25) showed 3736 public and private infant schools with 366,797 enrolled pupils and 81,026 public and private primary schools with 3,827,765 enrolled pupils. In November, 1926, there were 282 higher elementary schools for boys and 209 for girls. The numbers of pupils were 37,900 boys and 36,680 girls. Secondary education is provided by *lycées* supported by the State, colleges supported by the communes, and free schools supported by individuals and associations. In November, 1926, there were 125 *lycées* with 76,891 pupils and 242 communal colleges for boys in France and Algeria with 40,446 students, and 206 secondary schools for girls with 53,960 pupils. Higher education is supplied by the State universities, special schools under the direction of the State, and various private schools and faculties. No later statistics were available for higher education than those given in the preceding YEAR BOOK, when there were 52,960 students enrolled in the seventeen universities of France on July 31, 1925, distributed among the several faculties as follows: Law, 16,517; medicine, 9791; sciences, 11,466; letters, 10,229; pharmacy, 2500; schools of medicine and pharmacy, 2186; and theology, 271.

Other institutions dependent upon the Ministry of Public Education include: Collège de France; Museum of Natural History (which gives instruction in the sciences); Practical School of Higher Instruction, with its seat at the Sorbonne, offering courses in history, philosophy, and science; École des Beaux Arts; and various others. Dependent upon the other ministries are various institutions of technical instruction, including schools of commerce, agriculture, mines, forestry, military and naval science, etc., and finally, there are numerous technical schools of a lower grade dependent upon the Ministry of Public Instruction.

AGRICULTURE, ETC. The following table from the *Commerce Year Book* for 1928 gives the acre-

age and production of the principal crops during 1926 and 1927:

CROPS: AREA AND PRODUCTION

Crop	Area (thousands of acres)		Production (thousands of units—bushels except as indicated)	
	1926	1927	1926	1927
Wheat	13,972	13,209	231,766	284,353
Rye	1,958	1,970	30,076	36,799
Barley	1,706	1,754	45,856	55,572
Oats	8,677	8,542	364,122	372,539
Potatoes	3,611	3,895	409,190	629,960
Sugar beets ..	563	545	4,860 ^a	5,573 ^a
Grapevines ...	3,344	3,393	1,077,499 ^b	1,300,399 ^b

^a Unit, metric ton; ^b unit, gallon of wine.

According to the same source, about 56,184,000 acres were devoted to crops in France in 1925, representing 26.4 per cent of the total land area; 27,699,000 acres were used for permanent meadow and pasture; 5,919,000, for trees; shrubs, and bushes; 25,567,000 were covered by woods and forests; and 11,741,000 acres were waste and uncultivated land. On Dec. 31, 1926, there were 14,482,000 cattle, 5,777,000 swine, 10,775,000 sheep, 1,388,000 goats, 2,894,000 horses, 185,000 mules, and 264,000 asses. The value of the principal crops in 1926 was as follows: Wheat, \$374,812,000; oats, \$192,312,000; potatoes, \$265,022,000; and grape wines, \$262,255,000.

MINING. A record coal production slightly higher than in 1926 was attained in 1927. Toward the end of the year production fell off because of lower consumption and competition of foreign coal. Market conditions were bad during a large part of the year; there was a heavy accumulation of stocks, and profits were low. To prevent the shutdown of many mines, government aid for the industry was required in the way of reduced railway rates, purchases of coal by public utilities, and the establishment of an import licensing system. Miners' wages were cut 10 per cent, though the number of workers remained practically the same. In spite of the restrictions, imports of coal were much higher, while exports remained approximately the same. The output of coke increased 8 per cent, while imports declined rather sharply.

MINERAL AND METAL PRODUCTION (THOUSANDS OF METRIC TONS)

	1926	1927
Coal and lignite	51,421	51,780
Coke (metallurgical)	3,768	4,068
Briquets	4,092	3,906
Iron ore	39,469	45,672
Iron pyrites	190	204
Potash (K ₂ O content)	366	372
Bauxite	408	540
Pig iron	9,393	9,298
Steel (ingots and castings)	8,386	8,268
Iron and steel (finished products) ..	5,487

The production of iron ore increased by 16 per cent and exceeded that in 1913. The heavier output was attributable especially to exports, as the domestic consumption remained almost stationary. Exports were more than one-fourth larger than in 1926. Shipments to Germany more than doubled and The Netherlands, Belgium, and Great Britain took considerably larger amounts. The potash production was maintained at practically the same level in 1927, as compared with notable advances made in 1925 and 1926. The relatively poorer showing was generally owing to unfavorable economic conditions. Toward the end of the year a law was adopted

defining the status and operations of the potash mines of Alsace, the administration of which is placed under the control of the Ministry of Public Works. France was again the largest producer of bauxite, the output of which showed a large increase.

MANUFACTURES. The following table from the above-mentioned source gives the manufacturing production for 1925, 1926, and 1927:

MANUFACTURING PRODUCTION

Product	1925	1926	1927
Silk (conditioned at Lyon) . . . 1,000 lbs.	14,471	14,577	12,707
Wool (conditioned at Roubaix-Tourcoing) . . . 1,000 lbs.	184,472	223,864	229,049
Wool (conditioned at Mazamet) . do.	38,281	46,006	58,387
Cotton cloth			
. 1,000 yds.	1,310,693	1,356,064	1,298,103
Artificial silk			
. metric tons	6,500	8,000	13,000
Boots and shoes (estimated)			
. 1,000 pairs	75,000	80,000
Alcohol			
. 1,000 gals.	53,425	39,217
Refined sugar ^a			
. metric tons	750,280	666,055
Vessels launched			
. 1,000 gross tons	76	111	42

^a Data are for seasons ended following year.

COMMERCE. The total value of French imports in 1927 was 52,853,000,000 francs (\$2,073,952,000), as compared with 59,598,000,000 francs (\$1,932,258,000) in 1926. Exports were valued at 55,225,000,000 francs (\$2,162,729,000), as against 59,678,000,000 francs (\$1,935,178,000) during the preceding year. The weights of both imports and exports were much higher. Imports, totaling 49,359,000 metric tons, showed a 9 per cent increase over the 1926 figure, and exports at 38,051,000 metric tons were 17 per cent greater. The lower value in terms of francs resulted evidently from declines in French selling-and-buying prices abroad following the improvement in exchange value of the franc.

The falling off in franc value of imports was attributable largely to the heavy drop in franc value of raw materials, though on a dollar basis there was little change; in tonnage, those imports rose considerably, especially coal. Imports of manufactured articles were lower both in value and volume. Owing largely to insufficient crops in 1926, imports of foodstuffs, particularly wheat, increased considerably in both value and tonnage. Exports of foodstuffs were higher in value, but almost stable in weight. There was practically no change in franc values of raw materials exported during the two years, but their weight increased heavily in 1927. The franc value of manufactured articles declined sharply, though their volume was considerably higher.

That the visible trade balance was so favorable is traceable almost entirely to trade with the French colonies and protectorates. The total exports in 1927 to foreign countries other than colonies and protectorates were valued at 47,060,000,000 francs, while imports from those countries were valued at 46,807,000,000 francs, leaving an export surplus of 253,000,000 francs. The value of exports to the French colonies and protectorates was 8,165,000,000 francs, and of imports 6,046,000,000 francs, producing an ex-

port surplus of 2,119,000,000 francs. As compared with 1926 there was a large drop in the franc value of imports from the colonies and protectorates and also in exports to those countries. The lower value of imports applied practically to all the colonies. The value of exports to Algeria showed a substantial increase in nominal value, but those to the other principal colonies declined.

Imports from the United States, the largest supplier, were valued at 7,051,257,000 francs (\$276,691,000) in 1927 as against 7,913,087,000 francs (\$256,698,000) in 1926. Of this total, 36 per cent was represented by raw cotton. The quantity of cotton imports was slightly higher and their dollar value was also greater, but their franc value declined. Imports of grains were almost four times as much as in 1926, and the franc value rose in about the same ratio. Their value was 17 per cent of the value of total imports in 1927. The increase related principally to wheat and was brought about by a deficient cereal harvest in 1926. There was a big decline in imports of petroleum products on both a value, and a weight, basis. Imports of copper and of steam-driven and other machinery likewise fell off largely in weight and value. Other items showing declines on a weight basis were tobacco, tools and metal products, hides and raw furs, lumber, machine parts, and salted meats. Increases comprised principally coal, coal tar, bitumens and asphalt, sulphur, table fruits, colors, inks and crayons, animal fats, and chemical products.

Total exports in 1927 to the United States, fourth as a buyer, were valued at 3,605,055,000 francs (\$141,462,000) as compared with 3,901,572,000 francs (\$126,516,000) in 1926. Lingerie and clothing made up 13 per cent of the export values. While their weight and their dollar value were much higher than in 1926, the franc value was slightly lower. There was a decline in the weight and value of silk manufactures exported, though these constituted 10 per cent of total exports to the United States. Exports of cotton fabrics were greater in weight and in dollar value, but the franc value showed little change. Other principal items of exports to the United States showing increases in volume were hides and raw furs, manufactures of hides and skins, paper, tools and metal products, glass and crystal, prepared skins, rags, silk and floss-silk yarns, volatile oils, and iron and steel. Principal declines occurred in exports of wool fabrics, table fruits, perfumery, soap, chemical products, and potash.

FINANCE. According to the government proposals, total revenues of the general budget for 1929 would reach 45,280,929,000 francs, against which authorization was asked for appropriations amounting to 45,225,278,000 francs, leaving an indicated surplus of 55,651,000 francs. These totals represent an increase of 2,784,813,000 francs in revenues and 2,780,329,000 francs in expenditures, as compared with the budget estimates for 1928. In addition to the general budget, there were various annexed budgets, which for 1929 as presented, amounted to 6,233,674,000 francs. Of this total, the item "Posts, Telegraphs, and Telephones" represented 3,978,000,000 francs. Each annexed budget included its own independent revenues, which in the estimates correspond exactly with the expenditures authorized, any contribution from the public

treasury being included in the general budget. Consequently, the annexed budgets deserve only passing mention.

REVENUES AND THEIR SOURCES IN THE
FRENCH GENERAL BUDGET FOR 1929
[In millions of francs]

Item	(Estimated) 1928	(Proposed) 1929
Direct and assimilated taxes.....	8,536	9,797
Registry taxes	3,760	3,712
Stamp taxes	1,350	1,893
Taxes on transactions on the bourse	891	847
Tax on securities	3,426	3,525
Luxury tax	21	24
Customs duties	3,677	4,227
Indirect taxes	6,568	6,181
Business turnover tax	8,562	8,509
Sugar and saccharin tax	1,135	1,081
Monopolies	532	557
Public domain	444	444
Reimbursements	2,050	2,181
Sundry receipts	1,186	2,558
Exceptional receipts	342	288
Amounts recoverable in Algeria ..	17	22
Total	42,497	45,281

The following table shows proposed expenditures by categories for 1929, with comparative figures of estimated expenditures in 1928:

EXPENDITURES IN THE FRENCH GENERAL
BUDGET FOR 1929
[In millions of francs]

Ministries	1928 (estimated)	1929 (proposed)
Finance	25,279	25,241
Justice	246	286
Foreign Affairs	236	245
Interior	736	888
War	6,031	6,815
Marine	2,451	2,960
Public Instruction and Fine Arts	2,585	3,091
Commerce and Industry (commerce and industry, aviation and air transports) {	40	46
Labor, Health, and Social Welfare	218	317
Colonies	959	1,284
Agriculture	457	561
Public Works	381	454
Pensions	2,034	2,180
Total	792	907
Total	42,445	45,225

On Dec. 30, 1928, the budget was finally passed by the French Parliament with comparatively slight changes from the estimates presented by the Government. Expenditures were fixed at 45,366,000,000 francs and revenues at 45,430,000,000 francs leaving an estimated favorable surplus of 64,000,000 francs.

In the next column are shown the amount and composition of the public debt on July 31, 1926, and Feb. 29, 1928, the latest date for which such figures were published:

STABILIZATION OF THE FRANC. From a study on French National finance and stabilization published by the U. S. Department of Commerce in November, 1928, the following material is summarized. The committee of experts appointed by Parliament in the early summer of 1926, when the crisis in France was already acute, but before the Poincaré Government took office, pronounced itself in favor of the legal stabilization of the franc at the earliest possible moment. The Poincaré Government, however, realizing the unfor-

tunate position of the "rentiers," or holders of securities yielding a fixed income in francs, wished to avoid stabilization or at least to effect it at a higher level and was unwilling to take such an important step until all the conditions essential to its success had been fulfilled.

FRENCH PUBLIC DEBT ON JULY 31, 1926, AND
FEBRUARY 29, 1928
[In millions of francs]

Allocation	July 31, 1926	Feb. 29, 1928
INTERNAL DEBT		
Perpetual	101,676	101,740
Amortizable	43,644	77,579
Short term	42,262	25,757
Floating	94,197	77,018
Total, internal debt	281,779	282,094
FOREIGN DEBT ^a		
Commercial:		
United States	17,273	17,121
Great Britain	6,122	280
Netherlands	565
Argentina	452	300
Uruguay	197	79
Total, commercial	24,609	17,780
Political:		
United States	74,709	74,443
Great Britain	81,002	86,957
Total, political	155,711	161,400
Total, foreign debt	180,320	179,180

^a The official figures for the foreign debt are given in gold francs at the old parity. In the above table they have been converted into the new franc created by the Law of June 24, 1928, by using the coefficient 4.917.

Before the franc could be stabilized with a certainty that its value in the exchange markets of the world could be maintained, it was necessary that the equilibrium of the budget should be restored, that the Treasury should have at its disposal a balance sufficient to its needs, that the floating debt should be reduced and provision made for the regular amortization of the balance, that the advances to the state by the Bank of France should be greatly reduced if not entirely wiped out, that the circulation should be covered by an adequate metallic reserve, that a sufficient fund of foreign exchange should be accumulated to make it possible to check any speculative attacks on the franc, and that the country's balance of international payments should not be unfavorable.

Finally, in June, 1928, the Bank of France informed M. Poincaré that the increasingly heavy purchases of exchange it had been making for the account of the Government could not be continued without incurring grave risks and that it was unwilling to renew the convention under which these purchases were being made and which expired June 30, 1928. It was a question either of stabilization or of the rapid appreciation of the franc once the protection afforded it by the bank was withdrawn. As the latter would inevitably have been followed by a severe crisis both for the Government and for the public, the stabilization law was presented to Parliament on Saturday, June 23, after the close of the stock exchanges. It was passed by both Houses the following day and made effective June 25.

Until that date, the monetary unit of France was, legally, the franc of 322.58 milli-

grams of gold 0.900 fine, worth 19.3 cents. Actually, the franc had, since December, 1926, been worth approximately four cents. The stabilization law created a new monetary unit, still called the franc, but defined as 65.5 milligrams of gold 0.900 fine, or slightly more than one-fifth the former weight. The gold parity of the franc in terms of the dollar is now approximately 3.92 cents, or 25.52 francs to the dollar, which corresponds very closely to its exchange value at the time the law was promulgated. Because of this last fact there was no reason to anticipate any marked changes in prices and the cost of living.

SHIPPING. The merchant marine of France at the end of June 30, 1927, consisted of 1752 vessels of 3,469,980 gross tons.

ENTRANCES AND CLEARANCES OF VESSELS IN FOREIGN TRADE

	Entrances		Clearances	
	1926	1927	1926	1927
Number of vessels with cargo	24,149	27,503	22,637	24,781

RAILWAYS. The railway system is made up of six private lines and one state line, statistics of which are given in the following table. In addition, in 1926, there were 12,603 miles of local railroads with gross receipts of 337,537,000 francs (\$10,936,000).

STATISTICS OF PRINCIPAL RAILWAYS

	1926	State, 1926	Private, 1926

^a Including miscellaneous receipts not shown separately.

Gross receipts of the French railways were slightly higher in 1927 than in the preceding year, while operating expenses rose to such an extent that the net result was a deficit, as compared with a considerable surplus in 1926. Moreover, the small increase in receipts resulted from higher rates, as traffic fell off by 13 per cent for freight and 12 per cent for passengers. Daily car loadings averaged 60,369 as against 64,147 in 1926. Competition from automobile trucks was severe because of the high cost of railway

transportation. The deficit of the principal French railway companies in 1927 was estimated roughly at 850,000,000 francs against the surplus of 540,000,000 francs for 1926.

Taxes paid by the five major private railways of France in 1927 amounted to 2,569,000,000 francs, which were equivalent to 6 per cent of the French National budget. The largest of these railway taxpayers was the Paris-Lyons-Mediterranean which was assessed 958,000,000 francs, while the Paris-Orleans was second, paying 500,000 francs. According to the taxation scheme in force the Government collects 10 per cent on freight receipts and a graduated tax on the sale of passenger tickets, running as high as 60 per cent on first-class-de-luxe fares and averaging 32.5 per cent on combined passenger receipts. The Orleans and the Southern roads reported respective deficits of 84,000,000 francs and 74,000,000 francs after tax payments. Prior to the War the government tax on railway receipts was limited to 12 per cent on gross passenger revenue only.

As reported in the *Railway Age* (New York) in November, a new international railway link was established on November 1, with the completion of the Nice-Coni line, about 63 miles in length, joining the French and Italian cities and affording a short-line transportation route across the border between the two countries. Negotiations had been under way between the two governments for the building of the road since 1904, but the War and post-war circumstances prevented its completion until 1928. The new link just completed connects Nice with Viveola, Italy, passing through the Alpine Mountains and traversing some of the roughest country in the world. Due to this latter fact, it was necessary to construct 45 tunnels aggregating about 14¾ miles, the longest of which is 3¾ miles. There are also many bridges and viaducts made necessary by valleys and ravines. The nature of the country presented a number of engineering problems. One of the most serious of these difficulties was the nature of the soil which over a wide area of the line is of chalky substance, tending to cause landslides and necessitating the building of strong retaining walls, foundations, and deep drainages. A large deposit of sulphate of lime presented chemical difficulties resulting in the use of specially mixed cement for all masonry work. Thus the cost of the work on the final link reached an average of approximately \$442,000 per mile and a total expenditure of some \$17,639,150 was involved in the project. It was expected that the whole route will eventually be electrified.

For an account of the completion of the Franco-Spanish Trans-Pyrenean Railway, consult the paragraphs on *Railways* under the article, SPAIN.

ARMY. The French Army is divided into two forces, the metropolitan and the colonial, both under the War Ministry. There are three divisions of the metropolitan forces—the active army, reserves, and territorial army. The active metropolitan army on a peace basis in 1927 numbered 438,187, including an air force establishment of 32,886. Enlistment for the metropolitan army is regulated by the Law of April 1, 1923, and is on a compulsory basis, but liberal exemptions are allowed. Service in the active army is for 1½ years, although it is planned to reduce this to one year in 1930. Starting in

1927, service began at the age of 21. The colonial army is distinct from the metropolitan army and is made up partly of white troops and partly of colored troops. In 1927, the white troops of the colonial establishment numbered 59,000, the Foreign Legion troops numbered 10,000, and the colored troops, 180,000, making with the metropolitan army and gendarmerie, a total peace establishment of 717,483. The gendarmerie, a police force recruited from the army but concerned with civil functions, numbered 22,996 in 1927, about half of whom are mounted. The reserves and territorial army are divided into units corresponding to those of the active metropolitan army. See MILITARY PROGRESS.

NAVY. For an account of naval conditions in France, see NAVAL PROGRESS.

GOVERNMENT. According to the French constitution, the President is the executive, assisted by a cabinet responsible to the Chamber. The legislative power is vested in a Parliament or National Assembly. The President, elected by an absolute majority of vote for seven years, chooses his own cabinet; ordinarily, but not of necessity, selecting from among the members of of the two chambers. The Senate is made up of 314 members aged not less than forty years, and elected by an electoral college for nine years, one-third retiring every three years; the Chamber of Deputies is made up of 612 members elected by direct popular manhood suffrage for four years.

The President of the Republic in 1927, was Gaston Doumergue, elected June 13, 1924. The Ministry appointed July 24, 1926, was composed as follows: Prime Minister and Minister of Finance, Raymond Poincaré; Deputy Prime Minister and Minister of Justice, Louis Barthou; Interior, Albert Sarraut; War, Paul Painlevé; Marine, Georges Leygues; Foreign Affairs, Aristide Briand; Colonies, Léon Perrier; Public Instruction and Fine Arts, Edouard Herriot; Public Works, André Tardieu; Commerce, Maurice Bokanowski (q.v.); Agriculture, Henri Queuille; Labor, Hygiene, Assistance, and Social Prevision, André Fallières; Pensions, Louis Marin.

HISTORY

THE ELECTIONS. Interest in France during the early part of the year was devoted mainly to the elections which were to be held in April. All shades of political parties, of which there were more than a dozen, represented in the French Parliament were very keenly interested in the outcome and made every effort to assure themselves that their strength would not be weakened. It was quite evident to most observers that when Parliament opened on January 10, the debates would be held with one eye on the effect on the coming election and the other on the matter at hand. The first two weeks of the session were taken up with a discussion of the financial measures of the Poincaré Ministry. The opposition attacked the Government for not bringing about actual stabilization of the franc and insisted that it was about time that the National Union Government which was brought into power in 1926 to win "the battle of the franc" did something of definite value along the lines for which it was not only put in office but kept there. In a speech lasting seven hours, the Premier defended his position and

at the conclusion of the debate won a vote of confidence by 370 to 131.

A move which was bound to be reflected in the actions of the voters was the reduction of the military service from one year and a half to one year. This was popular on all sides and great joy was expressed at its passage although the law was not to go into effect until November, 1930. The issues of the campaign were almost entirely connected in some way or another with the financial measures of the Poincaré régime. Generally speaking, the Socialists were in favor of their capital levy idea, while the followers of Caillaux, the Radical Socialists, demanded stabilization of the franc and the readjustment of the entire tax system of the country. Other internal affairs, such as the religious and educational issues, and questions of foreign policy, were kept in the background to a large extent, although from time to time they cropped out in the platforms of the various political parties or in the speeches of the leaders. The ministry, which was made up of the leaders of most of the parties, would probably rather have their rule as a group continued than throw the fortunes of the country back into the turmoil of the old coalition governments which preceded the selection of Poincaré in 1926.

The election was set for April 22, and the second ballot, if necessary, for April 29. The Parliament adjourned on March 17. In passing, it might be noted that Parliament passed an important piece of social legislation before adjourning, namely, a workers' insurance measure, by the terms of which the Government was to form an insurance fund from 10 per cent of the wages of the worker, 5 per cent from employees and 5 per cent from employers.

The results of the elections held on April 22 and 29 were in accordance with the predictions of the best-informed observers. The Poincaré Ministry was virtually resworn into office with a larger majority than it had before. He could count on approximately 460 members out of 612 and if he cared to could get along without the aid of the Radical Socialists. As a matter of fact there was a distinct swing from the Left to the Right, one indication of such a movement being the reduction in the number of Communist members from 27 to 14. The largest single group in the new Chamber was the Republican-Democratic Union, the followers of Louis Marin, the Nationalist, who elected 162 members. The Radical Socialists returned 110 members and the Socialists, 101. Of the ministers who ran for reelection only André Fallières, Minister of Labor, failed to retain his seat. He was succeeded later by Louis Loucheur. Premier Poincaré, who is a Senator, was not up for reelection.

THE ALSATIAN QUESTION. One of the peculiar results of the election was the successful campaigns of three Alsatian autonomists, Ricklin, Rossé, and Dahlet. Since the return of Alsace from Germany to France, there had been a decided trend in certain quarters of the "redeemed province" for separation from France. This action was not desired particularly because of a preference for Germany but because there was a feeling that Alsace was neither French nor German but was a country by itself. The election of the three autonomists brought the entire separatist movement to a head and into the public press, much to the astonishment of

those people who believed that every waking thought of the Alsatians since 1870 had been reunion with France.

On May 1, only a few days after the election there was held a more or less spectacular trial on the charges of conspiracy of more than a score of agitators for the movement. Two of the defendants were successful candidates in the recent election and the third was a witness. Premier Poincaré had stated on several occasions that France would never consent to a separation of Alsace and Lorraine from France. On the other hand he attempted to mollify the Alsatians by stating that neither he nor his Government had any desire to interfere with the religious customs or the cultural traditions of the provinces. The Alsatians are all true Catholics and were afraid that after annexation France would introduce the separation of the church and state in the provinces and would attempt to close the religious schools. The result of the trial which was severely condemned in all Alsatian quarters was the finding of four of the fifteen defendants who actually stood trial, guilty, and the penalty imposed was one year in prison to be followed by five years in exile. G. E. Ricklin and J. V. Rossé, the two successful candidates for the Chamber of Deputies were two of the four convicted and imprisoned. For the Alsatian side of the problem the reader is referred to the International Relations Section of *The Nation*, vol. 127, No. 3293, published in the fall of 1928. Ricklin and Rossé were later pardoned by President Doumergue but were expelled from the Chamber.

THE NEW CHAMBER. The most important act of the new Parliament was the recognition of the *de facto* stabilization of the franc, by passing the Law of June 24 which made *de jure* stabilization, which had been expected since 1926, a fact. For the details of the law, see above under *Finance*. This was the most important measure of the Parliament which adjourned July 29 until the fall.

CABINET CHANGES. From the time of the elections there was a grave doubt as to whether the Poincaré Ministry could count on the support of all the factions which previously had been held together in the cause of the "battle of the franc." When the franc was finally legally stabilized, it was felt in many quarters that Poincaré had "done his bit" for France and should step aside. It was also felt by some of the component parties that their future lay more in "going it alone" than in tying up with the Nationalist Union group. This was particularly true of the Radical Socialists and the Socialists. The first important measure to be taken up in the fall meeting of Parliament was the question of the 1929 budget. Two phases of the budget were bitterly attacked by the opponents of Poincaré, namely, the provision concerning the disposal of property belonging to religious orders and the use of the money in the "proper" training of missionaries abroad, and, secondly, the military and defense sections of the budget. The Socialists, in particular declared that the military appropriations were far too heavy. A compromise was reached on the question of the religious orders, but the action of the cabinet was condemned by a meeting of the Socialist party and the resignation of four members of the party, Herriot, Sarraut, Queuille, and Perrier, from the cabinet was demanded. On

November 6, these four members handed in their resignations to Premier Poincaré, who in turn, handed in the resignation of the entire cabinet to President Doumergue, on the grounds of his off-asserted policy that the National Union cabinet would stand or fall as a unit.

President Doumergue consulted with the leaders of the various groups and the opinion of the majority seemed to favor the retention of Poincaré without the support of the Socialists. An attempt to recreate the left *bloc* failed and President Doumergue finally turned to Poincaré and requested him to form a new group. His attempts to organize a new government along the lines of the Nationalist Union cabinet failed because the Radical Left refused to cooperate. On Armistice Day, Poincaré announced a new cabinet which failed to give the Radical Left any representation. Poincaré himself failed to take a portfolio on the grounds that he needed his entire time to look after the government in general.

NEW CABINET. The new cabinet was composed as follows: Premier without Portfolio, Raymond Poincaré; Vice Premier and Minister of Justice, Louis Barthou; Foreign Affairs, Aristide Briand; Interior, André Tardieu; Finance, Henri Chéron; War, Paul Painlevé; Public Instruction, Pierre Maraud; Marine, Georges Leygues; Public Works, Pierre Forget; Commerce, Georges Bonafons; Agriculture, Jean Hennessy; Labor, Louis Loucheur; Colonies, André Maginot; Pensions, Louis Antériou; Air, Laurent Eynac. It will be noted, if a comparison is made with the cabinet named in the paragraph above on *Government*, that the four members of the Radical Left, Herriot, Queuille, Perrier, and Sarraut were dropped in the formation of the new cabinet, as was Louis Marin, a member of the Right. It was thought that although he was the virtual leader of the largest *bloc* supporting Poincaré, he was unavailable because of harsh attacks he made on the Left after the fall of the Nationalist Union Ministry. Maurice Bokanowski, (q.v.) a powerful member of the Union cabinet, was killed in an airplane accident on September 2.

The new cabinet, of course, without the support of most of the members of the Left, was compelled to direct the fortunes of the Government with a considerably reduced majority, approximately 320 out of a total of 612 votes. There was one thing in its favor, however, and that was the fact that it was practically solidly behind Poincaré, who was no longer compelled to dicker with the members of the Left to gain support for his measures.

SITUATION AT THE CLOSE OF THE YEAR. Premier Poincaré's new cabinet weathered one or two votes of confidence in the early stages of its career in early November, and then settled down to a discussion of the budget for 1929, parts of which had caused the disruption of the previous cabinet. As noted above under *Finance*, the budget was finally passed at the very end of the year. This achievement, however, was not accomplished without serious clashes in the cabinet itself, especially between the Premier and his Minister of Finance, Henri Chéron. The budget was really the work of the Premier when he held the portfolio of Finance and he did not always agree with the methods used by M. Chéron or the compromises agreed to by him in passing it through the two Houses. It was re-

ported in the press that M. Cheron told the Prime Minister that he did not wish him meddling with the budget which was now in his hands as Finance Minister.

For a short time in the last week of the year, it appeared that internal dissension would break up the cabinet. The two vital points of disagreement between Poincaré and Cheron were the questions of increasing the salaries of parliamentary members and the forbidding of members of either House to join companies in which they were not interested before election. The final result of the matter was that both measures passed over Poincaré's evident, but not expressed, disapproval. The Premier, in the heat of the discussions, threatened to resign, but the year closed without such action being taken and on the last day of the year the French press was unanimous in its opinion that although opposed successfully on these two measures of the budget, he would remain at the helm of the ship of state. As a matter of fact, he, himself so decided at a cabinet meeting held on December 31.

See KELLOGG TREATIES; PEACE AND PEACE MOVEMENTS.

FREAS, THOMAS BRUCE. American chemist and educator, died at New York, March 15. He was born near Newark, Ohio, Nov. 2, 1868. He was graduated from Stanford University in 1896, and received the Ph.D. degree from the University of Chicago in 1911. He was principal of the high school, Hiawatha, Kan., 1896-97; chemist with the Western Electric Co., Chicago, 1897-98; assistant in chemistry and graduate student, University of Chicago, 1898-1903; manager of the Ernest Leitz apparatus house, Chicago, 1903-04; instructor in chemistry, University of Chicago, 1904, and successively assistant professor, associate professor, and professor of chemistry at Columbia University, New York, since 1911. Professor Freas was an authority on the design and management of chemical laboratories and had an international reputation as an inventor and manufacturer of precision apparatus for use in chemical and industrial research. He was president of the Thermo-Electric Instrument Company. He was a fellow of the American Association for the Advancement of Science and a member of several other learned societies.

FREDERICK II, WILLIAM LOUIS LEOPOLD AUGUSTUS. Last Duke of Baden, died at Badenweiler, Germany, August 9. He was born at Karlsruhe, July 9, 1857, the son of Grand Duke Frederick I, and Princess Louise of Prussia, who was an aunt of the former Emperor William II. Having been educated at the universities of Heidelberg and Freiburg, he entered the German army, and was made Commanding General of the Eighth Army Corps, 1897-1901, retiring the following year. He succeeded to the throne of Baden, Sept. 28, 1907, and ruled liberally, without attempting to go beyond his constitutional powers. His government tried to bring about an early settlement of the World War, advocating democratic reforms in the empire, and it was his heir, Prince Max, his brother's son, whom William II chose as Chancellor of the Empire in 1918. The release of republican fervor which animated the German States in 1918 stirred Baden to a revolution, November 10, in spite of the popularity of the reigning Duke, and Grand Duke Frederick II,

whose family had ruled Baden for nine centuries, abdicated with the consent of his heirs, receiving due homage from the provisional Republican Government which took his place.

FRENCH CONGO. See FRENCH EQUATORIAL AFRICA.

FRENCH EQUATORIAL AFRICA. A French possession in Africa on the Atlantic coast between the territories of the Belgian Congo and British Kamerun, comprising the region formerly known as the French Congo. It stretches northward to the Bahr-el-Ghazel and Lake Chad, and is bounded by the Congo and Ubangi rivers in the interior. Area, 975,635 square miles; population, according to the census of 1926, 3,127,707, of whom 2502 were Europeans. The possession comprises the four colonies of Gabun, Middle Congo, Ubangi-Shari, and Chad. The boundary between French Equatorial Africa and the Anglo-Egyptian Sudan was fixed by an agreement signed Feb. 28, 1924.

Equatorial Africa is very rich in natural resources, but for the most part they are undeveloped. There are about 30,000 square miles of tropical forests extending to the Gabon coast containing many species of valuable timber. Palm oil and wild caoutchouc are the principal commercial products. Coffee is raised to some extent. Livestock includes cattle, sheep, camels, horses, asses, and ostriches. Copper, zinc, and lead are to be found. The total imports in 1926 were valued at 170,431,683 francs and the total exports at 94,249,135 francs. In 1928 the general budget for the four colonies balanced at 46,550,000 francs. The revenues are made up of import, export, and excise duties, navigation fees, and certain semi-direct taxes. The colonies are under a governor-general whose headquarters are at Brazzaville, but each colony is locally governed by a lieutenant-governor, aided by an administrative council. Governor-General, in 1928, R. Antonetti, appointed in July, 1924.

FRENCH GUIANA, gè-a'-ná, CAYENNE. A French colony and penal settlement on the northeast coast of South America. Area, about 34,740 square miles; population at the census of 1926, 47,341. Cayenne, a seaport town, is the capital with a population in 1926 of 13,936. The population figures do not include the number in the penal settlement of Maroni, the floating population of miners, French officials, or native tribes. The latest available educational statistics (1926-27) showed a school population of 3600 exclusive of Maroni, which had 215. The extensive forests are rich in timber of commercial importance. Although agriculture is not engaged in on a large scale, the following products are raised: cacao, coffee, gutta-percha, indigo, maize, manioc, rice, sugar cane, and tobacco. The chief occupation is placer mining for gold. Other minerals produced are silver, iron, and phosphates. The total imports in 1926 amounted to 61,973,600 francs and the total exports to 46,105,881 francs. The chief articles of export were gold, rosewood essence, various timbers, phosphates, cacao, balata, and hides. The budget for 1926 provided for revenues of 11,000,000 francs and expenditures of 10,500,000 francs. The colony is under a governor who is aided by a privy council and by a council-general elected by French citizens in Guiana, and is represented in the French Parliament by one deputy.

FRENCH GUINEA. A French colony on the west coast of Africa between Portuguese Guinea and the colony of Sierra Leone. Area, about 92,640 square miles; population, estimated in 1927, 2,133,003, including 2133 Europeans, of whom 1031 were French. Capital, Conakry. The chief products are palm oil, palm nuts, gum, rubber, millet, rice, and coffee; experiments have been made in the cultivation of bananas, pineapples, rubber trees, etc. In 1927 there were 460,000 cattle, 125,000 sheep, 170,000 goats, 2400 horses, and 580 asses. Some gold is found in the colony. The imports in 1926 were valued at 153,543,000 francs and the exports at 75,839,637. The chief exports were rubber, cattle, ground nuts, hides, wax, wool, and palm-kernels. The budget for 1927 amounted to 29,862,979 francs. The colony is under the Governor-General of French West Africa. See **FRENCH WEST AFRICA**.

FRENCH INDIA. The name given to the group of French dependencies in India, of which the chief is Pondichéry. The area of the five colonies is about 196 square miles and the collective population in 1927 was estimated at 284,432. The five dependencies with their estimated populations in that year were as follows: Pondichéry, 184,315; Karikal, 57,192; Chandernagor, 26,595; Mahé, 11,572; and Yanaon, 4758. In 1926 the Government maintained 59 primary schools and three colleges, with 300 teachers and 10,459 pupils. In 1927 the budget balanced at 2,835,350 rupees. The chief crops are paddy, rice, sugar, cotton, manioc, cacao, coffee, and groundnuts. There are at Pondichéry three cotton mills and at Chandernagor one jute mill; the cotton mills have, in all, 1635 looms and 72,060 spindles, employing 8225 persons. The total imports for all the dependencies in 1925 amounted to 44,274,164 francs and the total exports to 51,748,624 francs. French India has 43 miles of railway. The dependencies are under a governor whose headquarters are at Pondichéry, and an elective general council; they send one deputy and one senator to the French Parliament.

FRENCH INDO-CHINA. A region in south-eastern Asia, comprising the French colony of Cochinchina, and the protectorates of Annam, Cambodia, Tonking, and Laos, as well as Kwang-Chau-Wan, which has been leased from China, and the district around Battambang, which was ceded by Siam. Total area, about 274,385 square miles; population in 1927, 19,999,423, of whom 34,443 were Europeans (excluding military forces). The native Annamites constitute about three-fourths of the population. Capital, Hanoi, with a population of approximately 115,000. Other important cities are Cholon, Bindinh, Saigon, Phnom-Penh, Hué, Vien Thiane, and Haifong. The region of which Saigon is the centre is chiefly agricultural, being one of the greatest rice producing areas of the world, but fisheries along the coast and along the lakes are of some importance. Haifong is the centre of a region devoted to agriculture, mining, and manufacture. A third district around the port of Tourane produces chiefly cinnamon, sugar, and tea. In 1923 an irrigation system was completed reclaiming 45,000 acres on which two rice crops a year could be produced.

The mineral resources of French Indo-China include coal, zinc, tin, lignite, antimony, and wolfram. The forest reserves are very important but suffer from inefficient exploitation. The im-

port trade in 1926 was valued at 2,641,945,471 francs and the export trade at 3,033,440,986 francs. The general budget for 1927 balanced at 78,850,000 piastres for revenue and expenditure. At the end of 1927 the total length of railway, line was 1478, about two-thirds of which belonged to the Government. Indo-China is under a governor-general and a superior council which acts through a permanent commission, and at the head of each state is a resident superior, with the exception of Cochinchina, which is directly under the home Government. Governor-general (*ad interim*), M. Monguillot, appointed Jan. 24, 1928.

FRENCH IVORY COAST. See **IVORY COAST**.
FRENCH LANGUAGE. See **PHILOLOGY**, **MODERN**.

FRENCH LITERATURE. The slow return to normal after the wave of abnormality produced by the World War continued. The only striking feature perhaps was the formidable industry of French authors; they used to be satisfied with one, possibly two volumes a year; in 1928 many of them were producing three, four, or even more. It is true that—possibly for business reasons—the length of the books is often reduced; but even so, our remark remains true. More and more, we might add, the bulk of production was in the domain of fiction—especially if one adds to this the fad for interpretative biography which was so prevalent during the year.

Among the topics of discussion of the year, it is well to mention that the affair "Action-Française" (see previous **YEAR BOOKS**) was far from becoming less serious; three important publications were: Monseigneur Baudrillart, *Vocation catholique de la France et Fidélité au Saint-Siège à travers les Ages* (Conférences faites à Notre-Dame de Paris); P. Rémond, *L'Heure d'Obéir*; and trying to be quite impartial, Nicolas Fontaine (pseudonym for a well-known politician), *Saint-Siège, Action Française, et Catholiques intégraux*. The question of plagiarism once more came up; this year in connection with various works of André Maurois; see a good account in the *Saturday Review of Literature* of July 21, 1928. A parallel case to the Goncourt *Journal* publication and to a certain extent connected with it, was that of the Letters of Zola: was their publication contrary to public peace? Minister Herriot, supported by Premier Poincaré, decided in favor of the publication in spite of the Academy Goncourt's protest. Another quarrel, of the same nature, broke out when a man of letters published certain statements about George Sand, which were found most objectionable by the descendants of the famous authoress; see, about the Lauth-Boulinger quarrel, the *Mercure de France*, August 15. The presentation of a play (September 15, Porte St. Martin), *Napoleon IV*, came near creating a diplomatic incident between England and France, Maurice Rostand, the author, having taken as the subject the legend according to which Queen Victoria would have favored a plan to send the descendant of Napoleon III to Africa to be killed, thus freeing Europe from a new Napoleonic threat.

Much was made of the centenary of Taine; it amounted to a real rehabilitation since for some years attacks on him had been plentiful; the *École Normale Supérieure* especially celebrated one of her most distinguished spiritual sons.

The Sorbonne organized a special ceremony to commemorate another "normalien," Edmond About, also for his hundredth anniversary. Jules Verne received from the press his share of honors, for the same reason. Finally the tercentenary of Malherbe was marked by two new editions of his poetical works (*L'ardanchet*, and *Cité des Livres*). Let us recall here the ceremonies in which the City of Paris took possession of the famous Maison d'Hauteville (in the Island of Guernsey) which was converted into a Victor Hugo museum (there were written some of the best known of the poet's works, as *Les Misérables*, and *La légende des siècles*); these took place June 15, 1927, and were followed by the appearance in 1928, of a luxurious publication, richly illustrated, by R. Weiss (Imprimerie nationale).

POETRY. In spite of advancing years, Henri de Régnier remained faithful to the muse; his *Flamma Tenax* is a challenge to our age which seems to stifle poetry: poets need not despair; V. Hugo is praised as the great master. Another veteran is Francis Jammes who in connection with his *Divine Douleur* writes a brilliant manifesto against the modern trend of literature. Maurice Rostand, in *Morbidezza* strikes the note of romanticism and especially reminds of Musset's *Maladie du siècle*: Charles Vildrac published his *Poèmes de l'Abbaye* (a very timely publication since much has been written recently about this group, the best-known representative of which is Duhamel). Jules Romains offers a bouquet of *Les chants de dix années*. Tristan Derème sings in his usual vein, in *L'Enfant perdu* (anacreontic). Marcel Ormay, author of *Cœur gros. Carrefours. Visage retourné*, of the school of "Le Divan" (he is a disciple of Toulet), earns the desirable Prix Catulle Mendès, while Ch. Th. Feret wins the Prix des Vikings with *La Normandie exaltée*. The most coveted prize in poetry, however, the *Prix Moréas* (5000 francs), went to Philippe Chabaniex for his whimsical and graceful *Bouquet d'Ophélie*, with, as very close rivals, Dubech's *Poèmes*, A. Mary's *Poèmes*, and Émile Herriot's *Poésies*. Many poets would no doubt deserve as much as the few following to be remembered, but space is limited: J. L. Aubrun, *Le Lys brisé*; George Day, *Rhapsodie en mauve*; Louis Chollet, *La flamme errante*; Jean Malan, *Vingt poèmes de la nuit*.

THEATRE. Some of the successes of the year were: Lucien Descaves, *Les fautes de l'amour*, in which this old naturalist advocates in a rather old-fashioned realistic drama, sympathy and forgiveness for the "fille-mère"; then, to the surprise of many, Giraudoux's *Siegfried et le Limousin*, the novel of a few years ago (double personality); then, Tolstoi's *Le cadavre vivant*, success due in great part to the talented presentation of the Pitoëff company. Finally the "succès de scandale," Maurice Rostand's *Napoléon IV* which was mentioned above. Moving in the same historical cycle, Sacha Guitry wrote his best success of the year, *Mariette, ou comme on écrit l'histoire*, a love episode of Prince Louis Bonaparte, later Napoleon III. Luc Durtain had a succès d'estime with his *Donneur de sang*, at the Odéon. A play which was interesting at least as far as the idea is concerned, was M. Charmel, *Les trois langages* (Théâtre de l'Œuvre): A nervous woman; in the first act, she always says the opposite of what she thinks—and all goes wrong; in the second act, she says all she

thinks, with the utmost frankness—and all goes wrong; in the third act, she offers a mixture of truth and lying, and this works best. An amusing sketch of Alfred Savoir, *Le cocktail*, is inspired by an American law according to which a man has no right to receive a lady in his hotel room, except if there is a sitting room adjoining the alcove—and then he must leave the door open toward the hall: A young Frenchman receives a former fiancée, and gets into trouble.

This leads us to the plays that claim nothing but to amuse the public and which as usual were rather numerous and good: a few of the best are H. Duvernois, *Eusèbe*; Roger Martin Du Gard, *La Gonfle*; *Farce paysanne*; Marcel Achard, *La vie est belle*; Raoul Praxy, *Le jeu du mari*; Birabeau et Dolley, *La fille et le garçon*, and *Votre sourire*. The play by Ed. Schneider, *Exaltation*, which won the Prix Brieux of 3000 francs against 300 competitors, was presented in Geneva, but not in Paris up to the end of the year (it was published by *L'Illustration*). Let us not forget to mention the remarkable performance of Aristophanes's *Birds* (adapted with Mussolini as the "Duce") at the theatre of La Chimère. New volumes of the *Théâtres complets* of Porto riche and of Roman Coolus came out; also a volume of H. Duvernois, *Comédies en un acte*; and Pierre Hamp, *Monsieur l'Administrateur* and *Madame la Guerre*. Jean Cocteau published an *Antigone*. Two volumes of interest were L. Dubech, *La crise du Théâtre*, and E. Sée, *Le Théâtre français contemporain* (Colin). The Hugo Cromwell had not yet been given at the Comédie Française.

THE NOVEL. The *Grand Prix du Roman* of the French Academy was awarded in June to Mme. Jean Balde (well known especially for her novel *Vigne et maison*) for her new book *Reine d'Arbois*—a not very original theme, but treated with a great elevation of thought. In December the Prix Goncourt went to Maurice Constantin-Weyer, who had already won recognition by several volumes dealing with Canadian life (where he had stayed for some years, just like L. Hémon, the author of *Maria Chapdelaine*); the crowned book, which consists chiefly of description of wild Canada, is called *Un homme se penche sur son passé*. Votes went also to P. E. Cadilhac, *Flambeaux éteints*, Mare Stéphane, *Cœur de Trimard*, René Bizet, *Double vie de Gérard de Nerval*, André Chamson, *Le crime des justes*. The Prix Femina went once more to a woman, Mme. Dominique Dunois (real name, Marguerite Lemesle) for her *Georgette Garou*, a very modern story of the experiences of a brave peasant woman who has no child from her husband to inherit the farm and tries to escape the odium in getting one from another man, and then is tabooed. Votes went also to Ignace Legrand, *La patrie intérieure*—a sombre war book, Drieu de la Rochelle, *Blèche*, André Malraux, *Les conquérants*. The *Prix Renandot* (mock prize because there is no money award connected with it) went to André Obey's *Joueur de Triangle*, depicting the soul of a child with a musical avocation. Votes went also to Martin Maurice, *Amour, terre inconnue*, and to René-Marie Hermant, *Sale coin*.

As opposed to the modern tendency to write short and quick books, one must bow before such attempts to be more substantial and profound as Behaine's *Histoire d'une société*, begun in

1908 and the eighth volume of which, *Avec les yeux de l'esprit*, was published; Roger Martin Du Gard added two volumes to his *Les Thibault* series, namely, *La consultation*, and *La sœur-lina*; and Jules Romains offered the second volume of a trilogy under the name *Le dieu des corps*: *Julienne* was the first volume, the second now is *Dieu des corps*, and the third *Quand le navire* is to come. This year's book was not to be recommended to young people. A fine novel in the good realistic vein is Eugène Montfort's *César Casteldor*: Georges Iman's *Le cœur et les chiffres* could have as motto the phrase "D'un côté des coquins avoués, de l'autre des forbans hypocrites." Gaston Chérau's *A l'ombre du maître* is a rather sad family picture with a tyrannical head; François Fosca's *L'amour forcé* shows once more the harm brought about by slander and gossip; Pierre Bost continued to score, this time with a novel on business life, *Faillite*; and Marcel Rouff in *Joubahan* pointed out the evils of an over-industrialized society. André Maurois left for a while biography for an original novel, *Climats*: a man married first to a woman he loves passionately while she is calm in her affection, then to a woman who loves him passionately while he is moderately moved.

Henry Bordeaux also tried hard to renew his style, first in *Calvaire de Cimiez*, with a Solomon-wise judgment, and then in *Andromède et le monstre*, a woman in the artistic circles of Paris, who is under the spell of a man from whom she cannot free herself (Racinian theme). P. Benoit, in *Azelle* writes about international marriage between a Frenchman and a German woman. Thierry Sandre shows more appreciation of nuances in his *Les yeux fermés*, in which a war nurse marries a war blind man, and her courage does not prevent the feeling of the real sacrifice. Fr. Carco, *Rue Pigalle* and Phil. Soupault in *Dernières nuits* describe the Paris-apache. Duhamel in *La nuit d'orage* gives a curious case of superstition to which a great scholar falls the victim. Mauriac's title, *Destins*, already indicated the trend of his story, and Henri Deberly (the author of *Le supplice de Phédre*) in *Un homme et un autre* describes one of those cases that Porché (see the last YEAR BOOK) wished to banish from literature. Louis Artus, in *Les chiens de Dieu* had a profoundly catholic novel. E. Pérochon, author of *Néne*, Goncourt Prize in 1920, had a delightful book on animal life, for children, *Le livre des quatre Saisons*.

Let us end this list of interesting novels of the year by mere mention of A. Thérive, *Sans âme* (heroism of the oppressed classes); E. Zavier, *La course aux rebelles*; L.-L. Martin, *L'ascension d'Élise Amour*; Ch. Derennes, *Les noces de la banquette* (eighteenth century); and two peasant stories—stories not as popular as they were some years ago: Bouzinac-Cambon, *Le domaine abandonné*, and G. Barbarin, *Le père Pou* (quite a character).

There were three historical novels that cannot be left unmentioned: J. H. Rosny, *jeune, Les Furies*, in which an attempt is made to show William II of Germany carried away by fatal force, "les furies"; L. Dumur, *Dieu protège le Tsar*, the Rasputin affair treated without reticence; and M. Magne, *Poison de Goa*, a picture of Inquisition Spain.

Still quite in vogue were novels dealing with exotic themes. Among the best were: Dorgelés,

La caravane sans chameaux: A Malraux, *Les conquérants* (China); Jacques Heller, *Nord, récits de l'Arctique* (very successful); Panait Istrati kept fascinating the public with his Near East revelation a little in the Gorki style: *Mes Départs*, and *Les chardons de Baragon*. Shall we classify here Ch. Oulmont's *Cœur à corps*, a description of the society of Geneva, seat of the League of Nations?

A few novels of the gay sort: Tristan Bernard needs no praise for *Le voyage imprévu*; the same is true of Dekobra who offers *Minuit*. Less known but just as witty is Lefèvre, in *La Grâce de Lisieux*. A curious satire on Paris and surroundings is René Jouglet's *Voyage à la République de Piles*. See also Jean Maréze, *Apprenti Gigolo*; Henri Falk, *Le Fils improvisé*.

That when women throw overboard the social restraint in art they hardly know where to stop in their desire to out-distance man was once more evident in 1928: Rachilde leads with *Le Prisonnier* (allusion to Bourdet's famous play on Lesbianism in 1926); then comes Mme. Jean-Maxime David with *Premier inceste*; Gabrielle Réval describes Revolutionary Russia in *La tour de feu*; Mme. Claude Isambert in *Le voyage avec l'ombre* shows a woman in revolt, coming back, however, at the end to more rational views of life; Elissa Rhaïs, offers her *Sein blanc*. Quite chaste is Marie LeFranc (the Femina Prize, 1927) who describes her dreaming in Canadian wilderness in *Le Poste sur la Dune*; Mme. Jean Balde, having received the *Grand Prix du Roman* in June, had a new novel ready in the fall, *Aiguillage*. Henriette Charasson offers *Deux petits hommes et leur mère*.

SHORT STORIES. Almost at random may be quoted among the most successful: Kessel, *Nuits de Sibérie*; Paul Morand, *Magie noire* (Negro stories collected in various continents); Claude Farrère, *L'autre côté* (meaning the other side of the grave); Jean Schlumberger, *Yeux de dix-huit ans*; Luc Durtain, *Hollywood dépassé* (American stories); Edmond Jaloux (*Grand Prix de Littérature* in 1928), *La branche morte* (in the style of Estautié); Marcel Boulenger, *Scrupule d'ildeverte* (light); Barbusse, *Faits divers*. And last, but not least, P. Bourget, *Deux nouvelles* (*Confidence de femme* and *Scrupule d'apostat*).

VARIOUS ITEMS. As usual, such books which cannot be refused a place in literature, yet cannot properly be classified in the conventional genres, are mentioned here: Maeterlinck's studies on the more than three dimensions space, *La Vie de l'Espace* (Cf. Richet's *Notre sixième sens*); Duhamel's *Les Sept dernières plaies*, which is a sort of continuation of *Civilisation*; L. Daudet's *Les Disciples d'Emmaüs* (in the series *Courrier des Pays-Bas*); Princesse de Biblesco, in *Noblesse de Robe* has a philosophical treatise on the dress in modern civilization. The brothers Tharaud give reminiscences in *Mes années chez Barrès* (as secretary). Then, there are again several volumes giving impressions of French authors abroad, such as H. Béraud, *Rendez-vous Européens*; P. Morand, *Paris-Tombouctou*; H. de Régner, *L'Altana ou la Vie Vénitienne* (1899-1924); Henriette Célérie, *Épopée marocaine*.

Almost as popular as the novel was the interpretative biography; there was a regular deluge of these volumes in 1928. A few titles may be given. In the collection *Les Grandes évis-*

tences: Bizet, *Double vie de Gérard de Nerval*; Charpentier, *Vie meurtrière d'A. de Musset*; Escholier, *Vie glorieuse de V. Hugo*; Journeval, *Vie orageuse de Mirabeau*; Arnaud, *Vie turbulente de Camille Desmoulins*; André, *Vie harmonieuse de Mistral*, etc.; in the *Collection des vies amoureuses*: Gérard d'Houville, *La belle Hélène*; Reboux, *Mme. Tallien*; Franck-Nohain, *La Fontaine*; Maclair, *Baudelaire*; Royer, *George Sand*, etc.

In other collections, or independently: Lives of musicians: Guy de Pourtalès, *Louis II de Bavière, ou Hamlet roi*; Fauchois, *Beethoven*. Lives of kings: G. Goyau, *Saint Louis*; Maître Henri-Robert, *Louis XVI*; Almérás, *Louis XVII* (believes that the child actually died in the Temple prison). Lives of saints: Fr. Jammes, *Cardinal Lavignerie*; H. Lavedan, *M. Vincent, aumônier des galères*. Lives of all sorts: Ch. Maurras, *Théodore Aubanel*; E. Magne, *Nicolas Poussin, premier peintre du roi*; Delteil, *La Fayette*; R. Chantemesse, *Roman inconnu de la Duchesse d'Avranches*; Dr. Lucian Graux, *Le Docteur illuminé* (Raymond Lulle). Also collective works: L. Madelin, *Les Hommes de la Révolution*; and G. Doutrepont (a Belgian), *Les types populaires de la littérature française* (2 vol.). Also literary autobiographies continued to pour in: H. Béraud, *Gerbe d'or*; Ph. Soupault, *Histoire d'un blanc*; Julien Benda, *Mon premier testament* (showing how emotions dictate opinions); Colette, *La naissance du jour* (after many other volumes of reminiscences); and the eighth and last volume of Jules Renard's *Diary* (giving souvenirs of Moréas, Porto Riche, Barrès, Guitry, Capus, Tristan Bernard, etc.).

HISTORY OF LITERATURE AND CRITICISM. The ninth volume of F. Brunot's *Histoire de la langue française (Révolution et Empire)* came out. The collective study of Doutrepont, *Les types populaires de la littérature française* has been mentioned before. Then, for the mediæval period one may call attention to an adaptation in modern French of the *Roman de la Rose* (by André Mary), and to the fourth and last volume of Langlois, *Vie en France au Moyenâge*; in the sixteenth century, A. Garnier's considerable work in three volumes, *Agrippa d'Aubigné et le parti protestant*. In the seventeenth century, two more volumes of Abbé Bremond's remarkable *Histoire du sentiment religieux en France depuis les guerres de religion*, which deals with literature as well as theology; an excellent volume by an American (a graduate of Smith College), M. E. Storer, *La mode des Contes de Fées, 1685-1700*; and the original *Vie de Racine* by Mauriac. In the eighteenth century: Bertaut, *Égéries du XVIIIe siècle*; J. Legras, *Diderot et l'Encyclopédie*; R. Hubert, *D'Holbach et ses amis*; two new volumes of the important *Correspondance de Rousseau*; A. Schinz, *Pensée religieuse de Rousseau et ses récents interprètes*; F. Gaiiffe, *Mariage de Figaro* in the excellent new collection. *Les grands événements littéraires* (published by Maltère, Amiens). In this collection also appeared several volumes concerning the early nineteenth century; *Le Père Goriot*, *Les Orientales*, and *Madame Bovary*; also earlier *Tartuffe*. The Stendhal edition continued to arouse great interest, P. Valéry giving a preface to the novel *Lucien Leven*; P. Hazard has a *Stendhal* (in collection, *Vies illustres*).

Viatte had a long work on *Les Sources occultes du Romantisme*, and the well-known

Pierre Lasserre had *Des romantiques à nous*. V. Hugo inspired several volumes of importance; not only the charming biography by Raymond Escholier but two *Jeunesse de V. Hugo*, by Lebreton, and by Benoit-Lévy; moreover Lacretelle had the very searching *Vie politique de V. Hugo*. Hélène Altszyler had *Genèse des plans et caractères de Balzac*. V. Giraud had a notable *Taine*; and Henri Tronchon a discriminating *Renan et l'étranger*; while Calman-Lévy published two volumes of *Correspondance de Renan*. Mention may be made here of L. Lemonnier's double and very modern work, *Edgar Poe et la critique française, 1845-75*, and *Les Traducteurs d'E. Poe*. A volume unjustly left unmentioned in 1927 may be mentioned now; it is a very suggestive study of Prof. Leonard Schwartz, Stanford University, that was published in Paris, *Imaginative interpretation of the Far East in modern French Literature 1800-1925*. For the twentieth century: Rachilde, *Jarry ou le surmâle des lettres*; Pierre Quint, *Comment travaillait Proust*, and *Le comique et le mystère chez Proust*; and Ch. Daudet's *Répertoire des personnages d'a la recherche du Temps perdu*. E. Bouvier's little volume, *Initiation à la littérature d'aujourd'hui* was destined to solve many mysteries to many who stand before modern artistic creation as before a closed door. F. Mauriac had *Essai sur le Roman* which aroused some discussion; P. Claudel discusses poetry in *Positions et Propositions*; and Émile Herriot (literary critic of *Le Temps*) an excellent *Art de former une bibliothèque*.

EVENTS. The Grand Prix de Littérature, offered by the Academy went in 1928 to Edmond Jaloux, for *L'ensemble de son oeuvre*. He published *Branche morte* (see above). For other literary prizes, and for commemorations, see above. Among the dead of the year: François de Curel (q.v.), of the Academy; Aulard, the great modern authority on the French Revolution and its literature; Ed. Estève, author of *Byron et le Romantisme française*. Two public meetings of the Academy were held; to receive M. Mâle (June) and Paléologue (December). Gustave Simon, the president of the Fondation V. Hugo and in charge of the publication of the National edition, died in January. Edmond Haraucourt was elected to take his place.

See PHILOLOGY, MODERN.

FRENCH SOMALI (sô-mâlê) COAST or FRENCH SOMALILAND. A French colony in Africa on the Gulf of Aden between Italian Eritrea and British Somaliland. Estimated area, 5790 square miles; estimated population in 1926, 56,059. The port of Djibouti is the seat of the Government. Its population in 1921 was estimated at 8366, of whom 354 were European (190 French). After 1922 the Government introduced a public elementary school system at the capital, supplanting the mission school which had been in operation for 20 years. The budget for 1928 balanced at 13,002,000 francs. The country has practically no industries and very little agriculture. The main sources of wealth are commerce, inland trade, and coast fisheries. The imports in 1926 amounted to 457,751,424 francs and the exports to 401,543,750 francs. The chief exports are ivory, coffee, hides, and skins. The chief imports are cotton goods, butter, coal, and sugar. A large share of the exports of Abyssinia pass through the port of Djibouti, which is connected by a railway 485 miles long with Addis Abeba.

The colony is under a governor assisted by an administrative council.

FRENCH SUDAN. A French colony comprising the valley of the Upper Senegal, some two-thirds of the course of the River Niger, and a large part of the Sahara Desert within the sphere of Algeria. Bounded on the east by the Territory of the Niger; on the west by Mauretania, the Falmé River, and French Guinea; on the south by the Upper Volta and the Ivory Coast; and on the north by the territory of Algeria. Area, estimated at 360,331 square miles; population, estimated in 1926 at 2,634,982. The capital is Bamako, with 15,596 inhabitants. Other important towns and their populations are: Kayes, 9866; Timbuktu, 5485; and Sikasso, 9197. All the chief towns have regional or urban schools. The active crops include groundnuts, millet, corn, cotton, rice, sesame, rubber, and kariti; also many cattle are raised. Native industries are of some importance, including the making of pottery, jewelry, and leather, and weaving. The total imports in 1926 amounted to 85,907,623 francs and the total exports to 6,216,551 francs. The chief imports were cottons, foodstuffs, and metal-work; and the chief exports, groundnuts, cattle, rubber, gum, kapok, skins, and wool. The budget for 1927 provided for 39,600,000 francs. There is a railway connection with the coast over a line 745 miles in length. The colony is under the Governor-General of French West Africa (See FRENCH WEST AFRICA).

FRENCH WEST AFRICA. French West Africa, comprising the Atlantic coast colonies of Mauretania, Senegal, French Guinea, and the Ivory Coast, the colony of Dahomey on the Gulf of Guinea, and the interior colonies of French Sudan, Upper Volta, and the Territory of the Niger, includes the river basin of the Senegal, nearly all the upper and middle Niger Basin, the basin of a large number of rivers emptying into the Gulf of Guinea, and the southern part of the Sahara region. It had an area of 1,247,191 square miles and a population in 1926 of 13,541,611, as compared with a total area of all the French protectorates and mandated territories of 10,255,510 square kilometers and a total population of 55,631,184. So diversified is the native population of French West Africa that official French reports classify the inhabitants under more than 50 groups. Some very extensive areas of this region are practically deserted, while others have a population as high as 60 persons to the square kilometer.

The colonies had the following populations: Senegal, 1,318,287; Guinea, 2,095,988; Ivory Coast, 1,724,545; Dahomey, 979,609; French Sudan, 2,634,982; Upper Volta, 3,240,147; Mauretania, 289,184; Niger, 1,218,717; Dakar and Dependencies, 40,152. The total European population was 15,399, of whom 11,099 were French. The natives in general live by farming and stock-raising. Up to 1928, few useful minerals had been discovered and the output was comparatively small in value. There were in 1926-27, 292 village schools with 24,457 boys and 333 girls, 77 urban schools with 3507 boys and 1223 girls, and eight high schools with 558 pupils for general instruction, and 352 for manual instruction. There were also 144 evening schools for adults with 5790 pupils. The expenditure on education was 11,775,000 francs.

The financial estimates for 1928 placed the entire revenue at 749,730,000 francs, including

214,730,000 francs for the general budget, 350,000,000 francs for the local budgets, and 185,000,000 for the supplementary budget; the total expenditure was estimated at 709,730,000 francs, of which 214,730,000 was for the general budget, 330,000,000 for the local budgets, and 165,000,000 for the supplementary budget.

The imports into the colonies in 1926 amounted to 1,550,729,015 francs, while the exports totaled 1,412,028,809 francs. Imports amounting in value to 792,406,426 francs came from France and of the exports 527,347,423 went to France. The imports into French West Africa are mostly food substances, textiles, mechanical implements, and beverages; the exports from these colonies are chiefly fruits, oils, and oil seeds, as well as rubber, cotton, cocoa, and timber. In 1926, 21,369 vessels of 17,144,123 tons entered and cleared the ports of French West Africa. In the same year there were 1866 miles of railway open to traffic.

A governor-general, assisted by a council, is at the head of the administration of all French West Africa. The seat of government is at Dakar. Each colony is under a lieutenant-governor subordinate to the governor-general. Governor-General in 1928, M. Carde, appointed Feb. 20, 1928.

FRIENDS, RELIGIOUS SOCIETY OF. A mystical religious sect which originated in England in the middle of the seventeenth century. The founder of this religious society was George Fox (1624-1691), who visited America in 1672. The first Yearly Meeting in the United States was held at Newport, Rhode Island, in 1661, and has continued under the name of New England Yearly Meeting. Others established within the next forty years are known as Baltimore, Philadelphia, New York, and North Carolina Yearly Meetings, and these are composed of quarterly and monthly meetings having one or more congregations. In the nineteenth century, others were formed as migration moved westward. The largest body, known as the Orthodox Group, organized what is known as the Five Years' Meeting in 1902, which meets as a delegate body every five years, and in 1928 consisted of twelve yearly meetings, with a membership of approximately 81,000. Its headquarters are at Richmond, Indiana. The work of the various departments, such as Home and Foreign Missions, Peace, Religious Education, etc., was under the direction of executive committees and secretaries of boards. *The American Friend*, a weekly religious journal, is published at headquarters, as is also literature for the Bible schools of the Five Years' Meetings.

The Five Years' Meeting also maintains seven colleges for higher education as follows: Earlham, Richmond, Ind.; Penn. Oskaloosa, Iowa; Guilford College, Guilford, N. C.; Wilmington, Wilmington, Ohio; Whittier, Whittier, Calif.; Friends University, Wichita, Kans.; Nebraska Central, Central City, Nebr. Haverford College, Haverford, Pa., is maintained by Philadelphia Yearly Meeting; and Pacific College, Newberg, Oreg., by Oregon Yearly Meeting, with 3295 members, not a part of the Five Years' Meeting. Another Orthodox body not a part of the Five Years' Meeting is the Ohio Yearly Meeting, with a membership of 5137 in 1928.

The Liberal Branch of the Religious Society of Friends includes seven Yearly Meetings federated in the Friends' General Conference, which

meets in the even numbered years and conducts work in religious education, social service, and advancement of Friends' principles. The separation of 1827 centred around the doctrinal issues of that day and the preaching of Elias Hicks. The General Conference emphasizes the freedom of the individual to follow the voice of God in his own soul rather than any individual or church authority. The membership in 1928 was 16,560, and there were 138 meetings. Publications include the weekly periodical, *Friends' Intelligencer*, and a monthly magazine for children, *The Scattered Seeds*. The society conducts several secondary schools, and Swarthmore College, Swarthmore, Pa., was founded by it.

The tendency, of recent years among the Friends in America, has been more and more toward working together and with English Friends. Among the united undertakings were: The Young Friends' Conference; Woolman School, founded in 1915 as a school for religious and social study; the American Friends' Service Committee, formed in 1917 for war-relief work, and since the War conducting Friends' Centres at home and abroad for international understanding and reconciliation between conflicting nations, races, and other groups. A Conference of all Friends in America was called to meet at Oskaloosa, Iowa, in 1929.

FROST, ARTHUR BURDETT. American illustrator, caricaturist, and author, died at Pasadena, Calif., June 23. He was born at Philadelphia, Pa., in 1851, and at 15 worked as an engraver and afterward as a lithographer; he was, in the main, self-taught. He was employed by the New York *Graphic*, and in 1876 changed to Harper & Brothers, where he was associated with Abbey, Reinhart, and Alexander. Frost's works show thorough draftsmanship, honest, healthy, and delightful humor, and convincing naturalness. His first illustrations for a volume entitled *Out of the Hurly-Burly* (1872) attracted much notice. Other important illustrations were found in Stockton, *Rudder Grange* (1879); Octave Phonet, *Stories of a Western Town* (1893); Bunner, *Stories of a New York House* (1887). Although his work was called typically American, it was well liked in England, especially his illustrations for Lewis Carroll's *Hunting of the Snark*. His drawings of animals and negroes were racy of the American soil. Mr. Frost was also a writer of humor of considerable distinction. His books were: *Stuff and Nonsense* (1888); *Bull Calf and Other Tales* (1892); *The Golfer's Alphabet* (1898); *Sports and Games in the Open* (1899); *Book of Drawings* (1905); *Carlo* (1913).

FROTHINGHAM, frōth'ing'hām, LOUIS ADAMS. Member of Congress from Massachusetts, died August 23, at North Haven, Me. He was born at Jamaica Plain, Mass., July 13, 1871, and was graduated from Harvard College in 1893, and from the Harvard law school three years later. He was admitted to the Massachusetts bar, and during the Spanish-American War, in 1898, served as second lieutenant in the United States Marine Corps. After the War he returned to his law practice in Boston, and in 1901 he was elected to the Massachusetts House of Representatives, serving until 1905, and being speaker in 1904 and 1905. He was defeated as Republican candidate for mayor of Boston in 1905, but in 1908 he was elected lieutenant-governor of Massachusetts. In 1911 Mr. Frothingham was

unsuccessful as Republican nominee for governor. During the early years of the World War he was colonel of the Thirteenth Regiment Massachusetts State Guard, and in 1918 he was commissioned major in the United States Army. He was elected to the United States House of Representatives in 1920, and to succeeding congresses. He served several terms as an overseer of Harvard University, and lectured at that institution on the Government of Massachusetts from 1913 until 1915. He wrote *Brief History of the Constitution and Government of Massachusetts* (1916).

FUEL. In the fall of 1928 three large fuel conferences were held. These were the Second National Fuels Meeting of the American Society of Mechanical Engineers, the London Fuels Conference, and the Second International Conference on Bituminous Coals at Pittsburgh. At each of these meetings, and especially the last two, much attention was given to low-temperature carbonization of coal. While there had been no startling developments in any of the numerous processes during the year, steady progress had been made toward commercialization with some of these. In Great Britain there were 16 plants in operation capable of dealing with ten tons or more daily; with one exception these produced a smokeless domestic fuel. This exception was the Dunston plant at Newcastle-on-Tyne where the low-temperature coke and gas were burned under the boilers of the electric-generation station. The only by-products in this case were tar oils.

In the United States, interest in low-temperature distillation of coal was increasing. Much experimental work was going on and numerous studies were being made. Some of these coal distillation plants were adjuncts to central electric stations and others were independent plants turning out low-temperature coke for domestic use and various by-products. Certain of the existing processes were better suited to the former and certain to the latter. Among the installations in operation were the McEwen-Runge Process at the Lakeside power station in Milwaukee, the McIntire Process at Fairmont, W. Va., the Parr-Laing Process at Urbana, Ill., the Greene-Laucks Process at the Old Ben Coal Corp., Waukegan, Ill., the Wisner (carbocite) Process operated in conjunction with the electric station at Philo, Ohio, and the K. S. G. Plant at New Brunswick, N. J.

With one exception these installations may be said to have reached a semi-commercial stage at the end of the year, although the plant at Philo, where the coke was sold for domestic use and the gas burned under boilers, had met with sufficient success to warrant a second 50-ton unit. The K. S. G. Plant of the International Coal Carbonization Company at New Brunswick, N. J., went into operation. Because of its magnitude in contracting to furnish a billion cubic feet of gas per year to the Public Service Gas & Electric Company, and the proven success of the process in Germany, it was by far the outstanding plant of its kind in the United States. Construction work on a second K. S. G. plant had been started at the end of the year.

This was to be in connection with the Lukens Steel Company at Coatsville, Pa.

See CHEMISTRY, INDUSTRIAL; POWER PLANTS, STEAM.

FULLER, CRYSTAL EASTMAN. American leader in feminist and radical activities, died at Erie, Pa., July 28. She was born at Marlborough, Mass., June 25, 1881. She was a member of the Vassar College class of 1903, studied at Columbia University, 1904, and was graduated from the law school of New York University, 1907. She became connected with the Pittsburgh accident survey of the Russell Sage Foundation, and in 1909 was the only woman member of the New York State employers' liability commission. She was made secretary of the commission and drew up its report in 1911. In the same year she was married to Wallace Benedict, an engineer, and went to Milwaukee, Wis., to live. There she became leader of the Wisconsin woman suffrage workers. Her first marriage was terminated by divorce, and she was married to Walker Fuller, an English concert manager. She returned to New York and was chairman of the New York State branch of the Woman's Peace Party, a pacifist organization, during the World War. She was identified with organizations and movements of advanced radicalism, and in 1919 went to Hungary to convey greetings to the Soviet Government of that country from American sympathizers. With her brother, Max Eastman, she edited *The Liberator*, a paper that ceased publication.

FULLER, LOIE. American dancer, died at Paris, January 2. She was born at Fullersburg, Ill., in 1870. As a child actress she appeared at the Academy of Music, Chicago, and subsequently played a number of characters (including Ustane in *She*) before devoting herself exclusively to her specialty, dancing, in which she attained international fame. Her first original success was achieved in the "serpentine dance," with novel lighting effects produced by the throwing of lights on complicated moving silk draperies. After touring America she went to England, where she established a school of dancing. When she had trained a company she went to France, in which country she passed the greater part of the rest of her life. In 1900 she established her own theatre in Paris. Her two greatest successes were the "serpentine dance," already mentioned, and the "dance of fire." Miss Fuller established a firm place for herself in France as an artist, and she numbered among her friends such men and women as Sarah Bernhardt, Rodin, Flammarion, Catulle Mendes, Jean Lorrain, and the painter, Cheret; the last-named painted a portrait of her which is ranked among his masterpieces. She wrote *Fifteen Years of a Dancer's Life* (1913).

GAIRDNER, WILLIAM HENRY TEMPLE. English churchman and scholar in Arabic, died at Cairo, Egypt, May 22. He was born at Ardrossan, Scotland, July 31, 1873, and was educated at Rossall and at Trinity College, Oxford. Soon after leaving Oxford he became a missionary, and in November, 1899, went to Egypt as a representative of the Church Missionary Society. He had begun the study of Arabic at Oxford, and continued it at Cairo, and became recognized as one of the foremost Arabic

scholars. He founded a language school at Cairo for the service of his fellow missionaries. He wrote, among other works: *The Phonetics of Arabic*; *Egyptian Colloquial Arabic*; *Arabic Syntax*; *Bible Dramas (Joseph and His Brothers; Passover-night; Saul and Stephen; King Hezekiah, a Tragic Drama)*.

GALLIVAN, JAMES AMBROSE. American congressman, representative of the Twelfth Massachusetts District, died at Arlington, Mass., April 3. He was born at Boston, Mass., Oct. 22, 1866, and was educated at the Boston Latin School and Harvard University, graduating from the latter institution in 1888. For some years after his graduation he worked as a newspaper reporter. He entered politics as a member of the Massachusetts House of Representatives, 1895-96, and was a member of the State Senate, 1897-98. From 1901 to 1914 he was street commissioner of Boston, and from 1914 until his death, with the exception of one two-year term, he was a member of the national House of Representatives. He was a Democrat in politics and one of the leaders of his party in his state and the nation. Mr. Gallivan wrote: *The History of the Ancient Codfish* (1895) and *A History of Boston's Streets* (1904).

GAMBIA. A British protectorate and colony in West Africa at the mouth of the Gambia River. Area of Gambia proper, four square miles; population about 10,000. Area of protectorate, 4130 square miles; population in 1921, about 200,000. The capital is Bathurst, on the Island of St. Mary (population, 9227 in 1921). In 1926 there were seven elementary government-aided schools with 1637 pupils enrolled. In 1926 the imports totaled £656,307 and the exports, £904,166. The chief imports were wearing apparel and foodstuffs and the chief exports, ground-nuts, hides, and palm kernels. The public revenue in 1926 was £214,181 and the public expenditure, £213,643. The public debt amounted to £103,601. The tonnage of vessels entered and cleared in the foreign trade in 1926 was 1,252,796 tons, of which 771,022 were British. There are no local railways. The colony is administered by a governor, an executive council, and a nominated legislative council containing an unofficial element. Governor in 1928, Sir John Middleton.

GARBAGE AND REFUSE DISPOSAL.

For new installations incineration as a means of garbage and refuse disposal continued to gain, but established plants for disposal by feeding to hogs and by reduction for recovery of grease and fertilizer were holding their own. A seeming exception to this as regards disposal by feeding to hogs was afforded by the city of Providence, R. I., which put an incinerating plant for garbage and refuse in operation in 1928. There was, however, no systematic plan for disposal by hog feeding at Providence, in the sense that there was at Flint, Mich., and Los Angeles, Calif., as mentioned further on. Instead, hog feeding at Providence was carried on by various owners of hog farms who collected the garbage under the supervision of the Board of Health. This left the rubbish and miscellaneous refuse for separate collection and disposal. In 1927 collection and disposal of both garbage and refuse in Providence was put in the hands of the commissioner of public works and during the summer the construction of an incinerator was begun. The incinerator went into operation

in December, 1927. According to an article in *The American City* for August, 1928, the incinerator had a capacity of 160 tons per 24 hours. It is located about a half-mile from the city hall, giving an average haul of the garbage and refuse of about a mile from the residence portion of the city. The garbage and refuse are collected by trucks on each of which there are two 2-ton containers. At the disposal plant these containers are shifted in a garage to a car on a track and moved to a point beneath the crane. The latter lifts the containers and dumps their contents into the furnace. Ashes from the furnace grates are dumped into cooling pits in the basement and from these are dumped in turn into steel cars which are run on an industrial railway and lifted up to elevated storage bins from which the ashes are said to be taken to city parks for use as fertilizer. Commercial as contrasted with domestic refuse is brought to the incinerator by the proprietors of industrial plants and other business concerns.

A similar incinerator was put in operation in the Borough of Queens, New York City, in 1928, being the ninth incinerator of the same general type constructed in that borough within seven years. In the adjacent borough of Brooklyn contracts were let the latter part of 1928 for three 500-ton incinerators, to be operated by the contractor for the collection and disposal of garbage and refuse for that particular borough. In the borough of Manhattan there were already several large incinerators, each burning the garbage and refuse from adjacent areas. These had been built in line of recommendations of an investigating committee which advised incineration as a means of disposal of the garbage and refuse of the entire city. Near the end of 1928 the Board of Estimate and Apportionment authorized the expenditure of \$5,000,000 additional for four new incinerators. These, together with those already mentioned, will go far toward doing away with the practice of dumping garbage and refuse at sea, resumed a few years previously. Prior to that resumption, for many years the garbage of the larger part of Greater New York had been disposed of by the reduction process, under contract, as noted in earlier issues of the YEAR BOOK.

Chicago put an incinerator of 600 tons capacity in operation during 1928. It consists of six 100-ton furnaces grouped together. It will dispose of garbage and refuse from the northwestern part of the city. A garbage reduction plant, originally built many years ago by a company and latterly taken over by the city, will be relieved of the garbage collected in the part of the city tributary to the new incinerator. New Orleans contracted for three new incinerators during the year of which two will have capacities of 165 tons each and one of 50 tons, in all cases based on a 16-hour operating day. In all three incinerators the garbage and refuse delivered will be removed from the truck bodies by traveling cranes and conveyed for dumping directly into the furnace or else the truck bodies will be stored on the charging floor until a furnace is ready for receiving their contents. New Orleans had had two incinerators in operation for a number of years past.

Two notable examples of garbage disposal by feeding to hogs were reported by the cities of Flint, Mich., and Los Angeles, Calif., where the

method had been practiced for some time. The feeding plant at the Flint disposal plant was owned and operated by the city, while the one receiving the garbage of Los Angeles was owned and operated by a contractor who paid the city for garbage delivered to the loading station and hauled it by rail some 50 miles to a hog ranch. The hog farm owned and operated by the city of Flint is located some 12 miles from the city. The operation of the plant is under the direction of the city engineer. On Nov. 1, 1928, there were about 3500 hogs at the Flint feeding plant.

The contractor for the disposal of the garbage of Los Angeles utilized some 40,000 hogs for the purpose. A ten-year contract warranted the contractor going to considerable expense in fitting up the hog ranch for handling the garbage and the wastes in a thoroughly sanitary manner. One of the chief problems involved at any plant for the disposal of garbage by feeding to hogs is the collection and disposal of the garbage rejected by the hogs and of the manure which the hogs produce, the two together making up a large percentage of the garbage delivered to the plant. Difficulties having been experienced by the Los Angeles contractor in preparing these wastes for use as fertilizers by composting, a system of open-air drying was adopted. This is done on two large areas, each covered with 4 inches of concrete, the two having a combined area of more than four acres. The waste from the hog feeding floors is gathered by scrapers, loaded into trucks, and taken to and spread over the drying floors. At intervals the waste on these floors is turned over by plowing. When dry the wastes are gathered into windrows, loaded into carts, and taken to a screening and grinding plant. The material is first passed by means of a belt to and over a magnetic pulley. The latter holds tin and other metal to the belt until the fertilizer material has fallen off when the metal is delivered into a chute. Vibrating screens separate the finer material from bones and other coarse matter, these latter going to pulverizing hammers or grinders. Material from the grinders is drawn by a vacuum into a blower and delivered to a second vibrating screen finer than the first one. Both the ground material and the finer material that does not require grinding go to storage and are finally used as a fertilizer. Mechanical equipment is a feature of the entire hog-feeding plant (for detailed description of the latest improvements at the Los Angeles disposal plant, see *Engineering News-Record*, May 3, 1928, p. 692).

Some of the garbage-reduction plants are owned and operated by the cities which they serve and some by private contractors. A combination of the two was practiced at Syracuse, N. Y., the city owning the plant and leasing it for operation. A five-year lease expired in 1928 and after city operation for a brief period was renewed for another five years. In the nearby city of Rochester, the reduction plant is both owned and operated by the city. Both the Syracuse and Rochester plants were originally built and for many years operated by a private company, but were subsequently taken over by the city in each case.

Fermentation of garbage under a system in use in a number of Italian cities for some years past, known as the Beccari system, was put in use at Dunedin, Fla., the latter part of 1928. The only other American town to use this process

was Scarsdale, N. Y., where a plant was put in operation a few years ago (see YEAR BOOK for 1923, p. 274). The principal feature of the Beccari process as practiced in Italy was the placing of the garbage in bins or tanks and allowing it to ferment for some thirty days, the residue being available for use as fertilizer. Due perhaps to the differences in both garbage and climate, the plant at first built at Scarsdale did not work satisfactorily. It was closed as a result of a court order, on a nuisance complaint, and for a time the garbage of Scarsdale was burned at an incinerator in a neighboring town. Subsequently the Beccari plant at Scarsdale was rebuilt, with changes said to give satisfactory results.

GARDENING. See HORTICULTURE.

GARDNER, WASHINGTON. American public official, died at Albion, Mich., March 31. He was born in Morrow County, Ohio, Feb. 16, 1845. After enlisting in the Union Army in the Civil War at the age of 16 and receiving a severe wound at the battle of Resaca, he returned home and resumed his studies. He was graduated from Ohio Wesleyan University in 1870 and from the Albany Law School in 1876. He practiced his profession at Grand Rapids, Mich., for one year, and taught at Albion College, 1889-94. He was Secretary of State of Michigan, 1894-99, and a member of the United States House of Representatives, 1899-1911. From 1921 to 1925 he was Commissioner of Pensions. Mr. Gardner was prominent in the affairs of the Grand Army of the Republic and served as commander-in-chief, 1913-14. He was a Republican.

GARY COLLECTION, SALE OF. See ART SALES.

GAS, ILLUMINATING AND FUEL. The manufactured gas industry, in 1928, led the fuel industries of the United States in sales, according to an analysis made public by the American Gas Association. The following table of preliminary estimates prepared and given out by the industries themselves indicates the percentage increase or decrease in fuel sales for 1928 as compared with 1927:

Coke	+2.
Bituminous Coal	+4.8
Anthracite Coal	-5.
Crude Petroleum	+1.
Manufactured Gas	+3.8

The gain in manufactured gas, the Association stated, was in the face of a change from manufactured to natural gas in a considerable part of the country's territory during 1928, including some large cities.

The preliminary estimates of sales of illuminating and fuel gas in 1928, as compiled by the American Gas Association, indicated an increase of 18,000,000 cubic feet, 3.82 per cent, over the previous high total, with sales of 490,000,000,000 cubic feet, distributed as follows: 338,000,000,000 cubic feet for domestic consumption; 147,000,000,000 cubic feet for industrial and commercial uses, and 5,000,000,000 cubic feet for miscellaneous purposes.

During the year 1928, according to the same source, the use of gas for commercial and industrial purposes continued its phenomenal increase, which amounted to 7.75 per cent more than 1927 totals. Customers had reached a total of 11,800,000, an increase of 350,000 for 1928

alone; miles of main had increased to 93,500; operating revenue totaled \$519,000,000, or an increase of \$18,000,000 for the year; while investments had grown to \$3,000,000,000.

Although 1927 was a year dominated by business recession in which the general trend in many of the leading industries was toward a decline in production, the sales of gas for industrial and commercial purposes registered an increase of nearly 8 per cent, while the percentage increase in domestic sales was less than 2 per cent. Coal gas manufactured was increased from 71,000,000,000 to 81,000,000,000 cubic feet or 15 per cent in production; natural gas purchased and mixed with manufactured gas for public use increased by nearly 15 per cent; and coke-oven gas purchased and distributed by manufactured gas companies rose to more than 91,000,000,000 cubic feet, or about 8 per cent more than the output for 1926. A marked change had been taking place in gas production as reflected in the fuel requirements of the industry, in that the use of anthracite coal had been reduced to a negligible amount, showing a 50 per cent decline between 1926 and 1927, while there was some increase in the use of bituminous coal, and a larger increase in the use of coke, especially as generator fuel for water gas and as bench and boiler fuel, exclusive of the coke-oven gas purchased by distributing companies for public use.

This continued expansion and the progress which was occurring in the industry were accompanied by stability, and prospects point to continued growth in new and wider fields, in spite of the fact that in 1928 gas had more than 21,000 separate uses in industry, for research along technical and engineering lines, and also in gas utilization, marketing, and service activities the industry was experiencing new vision and realization of the large potentialities for development in the future.

In Germany, the collieries were promoting a scheme to effect the distribution of gas produced at or near the mines over the greater part of the country. The enterprise, which involved a huge expenditure of capital, was worked out to utilize coke and its by-products, and the operation was arousing considerable interest. An extensive system of mains was laid from the Ruhr and Westphalia toward Hanover, while extensions were to be made later to Berlin and Leipzig. Similar mains were to be laid from Lower Silesia and other coalfields, and if it was found that lignite gas was suitable for the purpose, it would be included in the distribution by a system of mains which would cover practically the whole of Germany. It was stated that the gas would be distributed mainly for industrial purposes, since the municipal gas undertakings refused to associate themselves with the colliery enterprise. The principal main from the Ruhr was of wrought iron and had a diameter of 32 inches, a thickness of a little less than $\frac{3}{8}$ -inch, to resist a pressure of 3 atmospheres. As the distance increases the diameter is diminished and the pressure augmented to 15 atmospheres at Hamm.

GAS AND OIL ENGINES. See INTERNAL COMBUSTION ENGINES.

GAS, NATURAL. The natural-gas industry, which showed a slow but steady increase in 1926, kept pace with the petroleum industry in 1927, reporting a record output, marketed at

reduced prices, according to the United States Bureau of Mines. The total amount of natural gas produced and delivered to consumers in the United States in 1927 amounted to a total of 1,445,428,000 M cubic feet, an increase over 1926 of 132,409,000 M cubic feet, or 10 per cent. Of this amount 296,036,000 M cubic feet were used by domestic consumers in the United States, an increase of but 2 per cent; while 1,149,208,000 M cubic feet represented the total consumption for industrial purposes, an increase of 12 per cent over the previous year. The average consumption per domestic consumer continued to decrease and in 1927 amounted to 74,300 cubic feet, as compared with 77,500 cubic feet in 1926, due no doubt to more efficient use. The price paid for natural gas by domestic consumers continued its steady increase, rising from 58.4 cents in 1926 to 60.8 cents in 1927, the latter price being nearly twice that paid in 1927. Ohio led the States in the number of domestic consumers, followed by California and Pennsylvania, while Indiana and Missouri were the only States which reported a decrease.

The total consumption by industrial users was divided about equally between field use, as for drilling, pumping, etc., and industrial uses, including gas burned in the production of carbon black, and gas used by manufacturing establishments. The increase in consumption of gas for field purposes occurred in Oklahoma and Texas, due to increased activity in drilling in those States; the increased consumption for other industrial purposes occurred principally in Louisiana, where there was a noticeable increase in use as fuel by refiners, and in the Panhandle district and the Gulf-coast district in Texas, for manufacture of carbon black and in industrial plants, respectively. The price of gas for industrial purposes showed little change, as had been the case for 10 years, in contrast to the steady and continued increase in cost to domestic consumers.

The production of natural gas in Canada showed an increase of 11.3 per cent for the year, according to statistics issued by the Dominion Bureau of Statistics. Total output was 21,376,791 M cubic feet, valued at \$8,043,010. Alberta led the four provinces which produced Canada's commercial natural gas, the output being 13,434,621 M cubic feet, followed by Ontario with 7,311,215 M cubic feet, New Brunswick with 630,755 M cubic feet, and Manitoba with 200 M cubic feet ranged from 20 cents in New Brunswick to 59 cents in Ontario and 27 cents in Alberta.

GENERAL EDUCATION BOARD. See **UNIVERSITIES AND COLLEGES.**

GEOGRAPHICAL SOCIETY, AMERICAN. The oldest geographical society in the United States, founded in 1852, "to collect and disseminate geographical information by discussion, lectures, and publications; to establish in the chief city of the United States a place where may be obtained accurate information concerning every part of the globe; and to encourage such exploring expeditions as seem likely to result in valuable discoveries in geography and related sciences."

In 1928 the leading activity of the Society was in the publication field; its *Geographical Review*, a quarterly periodical, was devoted to

original articles dealing with exploration and geographical research and reviews of the most significant geographical books; numerous maps were issued, and other publications consisting of books and pamphlets which fall into six series: *Research Series*, comprising specialized monographs; the *Special Publications*, having a general appeal; the *Library Series*, devoted primarily to collections of the Society; the *Outing Series*, of which two volumes had appeared up to the end of 1928: a *Trampers' Guide to the Palisades Interstate Park* and a *Trampers' Guide to the Vicinity of New York* belong to the fourth series; the fifth series is known as the *Map of Hispanio America Publications* and includes many basic maps of Hispanic America on a scale of 1:1,000,000 which are in conformity with the International Millionth Map of the World; of the sixth series, *Oriental Explorations and Studies*, dealing with the explorations of Prof. Aloisi Musil in northern Arabia, six volumes appeared during 1928.

The Society maintains a specialized geographical library and sponsors six regular lectures annually by distinguished explorers or geographers, for members and their guests. Contributions to the development of geographical science and exploration are recognized in the Society's election to honorary and corresponding memberships and in the bestowal of medals. The President for 1928 was John H. Finley, LL.D.; and the director was Isaiah Bowman, Ph.D. The Society's building is at Broadway and 156th Street, New York.

GEOGRAPHIC SOCIETY, NATIONAL. An organization founded in 1888 "for the increase and diffusion of geographical knowledge." During 1928 it continued its work in the field of research by sending an expedition to the Pavlof Volcano region off the Alaskan Peninsula for the study of the processes of volcanism there and their interrelation with eruptions and seismic disturbances elsewhere. The expedition was headed by Dr. Thomas A. Jaggar, volcanologist in charge of the researches in Hawaii, who, besides gathering much data which promised to aid in the forecasting of eruptions, discovered a number of new cones in the group, found some ice-ash jumbles of a type hitherto unknown, and explored a considerable area. Taken in connection with the work of the several expeditions of the Society to the Mt. Katmai region, under the leadership of Dr. Robert F. Griggs, which resulted in complete reports on the mightiest eruption of modern times and in the discovery of the Valley of Ten Thousand Smokes, the recent expedition brought together the fullest collection of data on Alaskan volcanic activity that exists anywhere. The expedition also found some evidence bearing on the continental-drift theory.

The task of constructing a pre-Columbian calendar for America, in order to link up with the present the eras of the Basket Maker and succeeding civilizations, discovered and studied by the eight expeditions of the Society to the Chaco Canyon country, under the leadership of Dr. Neil M. Judd, of the Smithsonian Institution, went forward steadily during the year. Dr. A. E. Douglass, University of Arizona, continued his search for timbers, beams, and stumps, whose rings were formed between the time of the Basket Makers and the present generation of trees. Since sun-spot cycles and other solar and

weather phenomena have a clear bearing on the prosperity of trees from year to year, with the connecting links established between trees of the present and the timbers of the days of the Bonitans, it would become possible to set up a calendar of events running back perhaps thousands of years in western America.

Work at the Society's solar observatory on Mt. Brukkaros, southwest Africa, was carried forward by the Smithsonian Institution's observers throughout the year. The attack upon the sun's radiation secrets from California, Chile, and Southwest Africa, simultaneously, was making possible an elaborate and accurate radiation history of the sun. The result of the year's observations was the accumulation of increasing evidence tending toward the establishment of the correctness of Dr. Abbot's theory that solar radiation and weather fluctuation are such closely related phenomena that the discovery of the laws of the one will mean the ability to forecast at long range the other.

The problem of the migratory warblers that summer in the United States and enjoy their winter vacations in Venezuela was the subject of an expedition sent to the latter country under the joint auspices of the Society and the Carnegie Museum of Pittsburgh, headed by Ernest G. Holt. Its purposes were to study their distribution among the grass, forest and other belts, attempt to throw new light on the origin and development of the migratory instinct, and trace the origin of many species that inhabit the coastal plain and the Orinoco Valley. This expedition also planned to give incidental attention to the flora and fauna of the country generally.

During 1928 bulletins dealing with the geographical backgrounds of current events were furnished to more than 600 newspapers, and weekly bulletins of timely geographical information were sent to about 35,000 school teachers. The Society also supplied material for press associations, and as a part of its educational work supplied a weekly ready-to-print service to about 1200 daily or weekly papers. Upon request, bulletins relating to the geography of Bible lands and mission fields were sent to about 80 church and Sunday-school periodicals and used by them in schools where Americanization work was in progress.

The chief activity of the Society in the diffusion of geographical knowledge is carried on through its official publication, the *National Geographic Magazine*. At the end of 1928 there was a membership of 1,200,000, representing every civilized nation. Officers for the year were: President and editor, Gilbert Grosvenor; vice president and associate editor, John Oliver LaGorce; treasurer, John Joy Edson; assistant treasurer, Herbert A. Poole; secretary, O. P. Austin; associate secretary, George W. Hutchinson; general counsel, Edwin P. Grosvenor; chairman committee on research, Frederick V. Coville; assistant editors, William Joseph Shorservice, J. R. Hildebrand. Headquarters are in Washington, D. C.

GEOGRAPHY. See EXPLORATIONS.

GEOLOGY. The year's contributions evidenced a general interest in field and laboratory research, also in speculative studies of those problems of earth origin and structure that lie beyond the reach of actual observation or instrumental tests. In this brief review it is only possible to select a few out of the great num-

ber of published articles and treatises for specific mention and to sketch very broadly the trend of study.

SOCIETIES. The fortieth annual session of the Geological Society of America was held at Cleveland, Dec. 29-31, 1927, where also assembled the Palaeontological Society and the Society of Economic Geologists. The subject of the presidential address by Arthur Keith was "Structural Symmetry in North America." The elements of symmetry which have fundamental importance in continental structure were stated to inhere in the arrangement and constitution of the mountain ranges; their origins may be traced back to very early periods of earth history, even to the pre-cambrian. The mountain uplifts and folds, according to Keith, came into existence through lateral pressure exerted from the boundary seas upon the continental margins, which have been the sites of extensive sedimentation. The Appalachian region in the east and the Cordilleran in western North America have been subjected to repeated thrusts, and the folds developed by such pressure were overturned away from the oceans, opposite to its source. Relative permanence of the continental margins throughout the repeated crustal adjustments may be regarded as an insurmountable obstacle to the Wegener hypothesis of continental drift, also in disagreement with it is the apparent increase of intensity of mountain building with the successive geological periods. In the Palaeozoic era crustal disturbances were strongest in the east, those of the Mesozoic and Cenozoic eras in the west. In Ordovician and Devonian times folds were developed in the Arctic region along the coast, but there were no corresponding representatives in the southern region.

The address of William A. Parks, President of the Palaeontological Society, "Some Reflections on Palaeontology," had to do with the mutual relations of palaeontology, biology and geology. Emphasis was placed on the teachings of paleontology in their bearing upon the theory of evolution; the order of appearance of life forms as revealed by the palaeontologist may be said to constitute the chief support for the orderly and progressive development of life. The chain of evidence has not been completed and the gaps in the record cannot be explained away altogether by appeal to the factor of migration. Change of environment must be regarded as an essential element in the mutation of species. Stable conditions lead to fixation of habit and close morphological adjustment; evolution is possible simply because habit can be changed and new tendencies developed. The doctrine of continuous evolution should not be taken in too rigid a sense, as some of the most significant advances in the history of life have occurred abruptly, as instanced by the evolution of the Metazoa from the Protozoa. Geological time is so long that the present manifold forms of life are not particularly remarkable, rather one may wonder that greater changes have not taken place in the stretch of antecedent periods to the beginnings of organic development in the Proterozoic era.

The President of the Society of Economic Geologists, F. L. Ransome, in his address, "Directions of Progress in Economic Geology," called attention to the need for more fundamental data, physical and chemical, about the processes concerned with ore deposition. Experimental

work was suggested as one way to secure the required information. Some of the important problems that challenge attention from the laboratory worker were noted, including the nature and capacity of the solutions which deposit metallic minerals, the behavior of silica in solution, the processes of magmatic differentiation in relation to ores, metasomatic replacement and sulphide enrichment. Geological students should maintain a questioning attitude rather than one of docile acceptance of pre-existing data and theories.

RECENT WORKS. Among the important contributions to regional geology may be mentioned *Geology of Mongolia*, by Berkey and Morrison who participated in the Andrews' expeditions of 1922 and 1923, in which they covered some 5000 miles of practically unexplored lands. The country has unique interest from the fact that it has not been submerged below the sea since Palaeozoic time, and the formations of later age are all of continental type. The development of land life, consequently, has been unbroken almost from the first appearance of air-breathing organisms, a condition favorable to an orderly evolution of types whose discovery may help to fill up some of the gaps in the palaeontological record. The present work lays the foundation for the systematic study of this remarkable region.

The later developments in geophysics are set forth briefly but comprehensively in a German work, *Lehrbuch der Geophysik*, to which the contributors include specialists in each field, like Sieberg for earthquakes, Born for vulcanology and crustal deformations, and Ansel for gravity and isostasy. The editor is Professor Gutenberg.

Another German publication that deserves mention is Sapper's *Vulkankunde*, a well-rounded treatise on the phenomena of volcanic activity and igneous intrusion and their multifarious geological bearings. The chapters on the chemistry of magmas and on magmatic differentiation pertain to a much broader field than is implied in the title of the book.

Among other treatises of recent issue may be mentioned *The Coral Reef Problem*, by W. M. Davis, who had collected first-hand observations of the coral islands of the Pacific, the Australian Barrier Reef, and some of the reefs of the Lesser Antilles, and lends support to Darwin's theory of the upgrowth of coral on sinking platforms, but with certain modifications for changing sea-level and temperature in Glacial times, as postulated by Daly, and for Molengraaf's views of a relatively local and isostatic subsidence in some instances.

Students of isostasy will welcome the work of that title under the authorship of William Bowie, who has been the most assiduous student and exponent of the theory in its application to geological processes.

A popular work, also designed for first students of geology, is *The Earth and its History*, by J. H. Bradley, Jr., a significant feature of which is the chapter dealing with the practical uses of the science. In the same category is *The Earth and its Rhythms*, by Charles Schuchert and Clara M. Le Vene. The latter book is to be commended for its clearness and accuracy, accomplished with sparing use of technical terms.

RELATION OF MOON'S SURFACE TO THE EARTH'S. Some interesting analogies between the physiographic features of the moon and the earth, par-

ticularly those found on the continent of Africa, were pointed out by E. H. L. Schwartz, who stated that giant craters of the lunar type occur widely and are well exemplified by Émil Kussi to the east of Lake Chad, by Geitai Gubib in southwest Africa and by the craters to the north of Lake Eyassi. Pilandsberg illustrates a peculiar lunar form in which concentric cones of cylinder shape are separated by fissures that have emitted various kinds of feldspathoid lavas. The Vredepoort Mountain on the Vaal River is a "cylinder up" thrust into the Witwatersrand beds, closely paralleling the lunar structure called Wargentín. In Africa, the Tertiary upheavals consisted of faults rather than folds, and features like the Rift Valley still stand out clearly despite the results of weathering. The Rift Valley practically duplicates the Alpine Cleft of the moon, and the fault scarps visible in the crater rings of the moon are so sharply defined that Schwartz believes they cannot be older than the Tertiary. Although atmospheric weathering may be excluded as an agency tending to erase the moon's relief, yet the rocks on its surface are subjected to intense strains, sufficient to produce disruption, from the alternate exposure to the sun's rays and to the cold of outer space.

ISOSTASY. The full acceptance of the theory of isostasy by geologists has been retarded by its apparent failure to account for the evidences of crustal shortening and collapse supplied by folded mountain ranges. The adjustments of strata involved in the maintenance of isostatic equilibrium between an area of crustal loading and an area of relief are generally conceived to be of vertical type and do not seem to call for any extensive horizontal component. Yet the geological data obtained by actual studies of mountain folds seem to imply great horizontal compression and shortening. C. O. Swenson considered that the magnitude of these horizontal forces cannot be explained adequately by expansion of the segment under relief from erosion in accordance with the isostatic principle of Bowie. There would appear to be some other process at work in the deformation. R. T. Chamberlin, also, remarked that on the isostatic theory the surface relief of the earth should steadily have diminished with progress of time. The mechanism of adjustment must work toward eventual equilibrium and a crust of uniform density. Lawson has developed the idea of elastic rebound to account for the overlap and folding of the rocks in the northern Rockies, as noted in the YEAR BOOK for 1927.

LABORATORY STUDY OF FOLDING. In an experimental research, Link called attention to some results in the production of arcuate and en échelon folds that may have significance in regard to the origin of these structures in mountainous regions. Various artificial preparations supposed to resemble different kinds of rocks in their response to compression were employed in the experiments. These are directed so as to show the effects of applying pressure differentially in the horizontal plane upon essentially homogeneous materials and again of applying uniform pressure against materials of variable rigidity or competency. Both methods produce results closely resembling natural mountain folds. By applying differential stresses upon incompetent materials an arcuate system of en échelon folds is developed in direction normal to the stress axes, with a general pattern in some

instances that suggests the form of Appalachian folding with its sinuous trend. The salient parts of the system appear to represent loci of greater compression and the recessed parts of smaller deformation. Variation of the materials used to represent sediments also leads to the formation of en échelon folds even without differences in the pressures exerted. A competent clay layer in the shape of an arc set against less rigid material develops an arcuate pattern comparable to the Jura Mountains, for which the origin may be explained by the rigid delta conglomerate (Nagelfüh) placed between the Alps and the Juras. The latter have arisen in response to pressures exerted upon weaker beds transmitted through the strong conglomerate.

MAGMATIC DIFFERENTIATION. Slow cooling and the agency of volatile compounds or mineralizers are the chief factors in the formation of the alkaline igneous rocks, according to C. H. Smyth, Jr., who accepts Daly's view that the alkaline and sub-alkaline rocks spring from a common parent magma of basaltic composition. The assimilation of limestone in the magma seems to be an unnecessary condition. Long-continued undisturbed cooling is most important, for thereby the mineralizers become more and more concentrated into the residual magma which holds the alkaline fraction until consolidation of the whole takes place. Rapid chill and crystallization of the primary magma, on the other hand, produces basic rocks of the basaltic and allied types. Because of its fluidity and low density, the alkaline fraction tends to collect in the top of the magma reservoir and thence works its way upward toward the surface. The alkaline rocks characterize regions of crustal stability like eastern North America and northern Europe, whereas folds and faults, where extensive and deep-seated, interfere with differentiation so that such regions as the Cordilleras and Pacific coast of North America contain mostly rocks of the sub-alkaline and basic groups.

CORAL REEFS. In its preliminary report the committee of Australian scientists who have been engaged in the study of the Great Barrier Reef summarizes some of the general features that have been brought to light thus far. The reef structure is a development chiefly of post-Glacial time. The continental shelf on which it rests came into existence by subsidence and on the submerged areas the coral organisms began to grow upward and outward. During the Glacial age a lowering of the sea-level took place by withdrawal of the waters in forming ice, and the lowered ocean produced plunging cliffs around some of the islands, such as the eastern members of the Cumberland and Northumberland groups and the Keppel Islands. There is no evidence, however, to show that the major reef zone is built on a rock shelf abraded around the continental margin by the lowered ocean. The fluctuations of sea-level in Glacial time are regarded more as complicating incidents than of controlling importance in the evolution of the reefs. The progress of the corals upward has not been counterbalanced by subsidence *pari passu* of the platform, as is inferred by some previous investigators and implied in the Darwinian theory of reef formation.

GLACIERS. By means of suitable instruments set in the solid ice of glaciers, R. T. Chamberlin observed that movement is not continuous

like a viscous liquid but takes place by a series of jumps indicative of recurrent stresses followed by sudden relief. Inasmuch as the capacity for storing up stresses is the property of an elastic solid, it follows that the material of glaciers is so organized as to have the rigidity somewhat of a rock although not to the same extent. Four general types of movement are evident in a glacier. The most important, measured by its results for the whole mass, is an idiomolecular exchange between granules of the ice, the individual granules rotating and changing position to accommodate themselves to the stress. Parallel structure and foliation in the ice arise from a second type, the solid stressing of aggregates of granules and movement along planes. A third type consists of intermittent slips along thrust planes, involving larger masses than the preceding. The fourth is represented by the sliding of the glacier *en masse* on its rock bed.

ABUNDANCE OF THE SIBERIAN MAMMOTH. In the two hundred and fifty years of Russian settlement, Siberia has yielded at least 50,000 mammoth skeletons, and the general average of 200 animals a year was maintained at the present time, according to I. P. Tolmachoff. There are 37 recorded discoveries of soft parts of the mammoth, besides two of the rhinoceros. The climate when these animals flourished could not have been much different than that of the present; if it had been warmer the flesh and ivory would not have been so well preserved. The animals seem to have been well adapted to their surroundings, as indicated by their wide distribution and the excellent physical condition of the specimens which have been preserved whole or nearly so. Their extinction can hardly be laid to changes of environment or defects of organization or extermination by man. Tolmachoff explains it as the result of extreme specialization, with a gradual racial decline. He states that the stores of fossil ivory will probably serve industrial needs long after elephant ivory has disappeared from trade.

MINERAL DEPOSITS. THE YEAR BOOK for 1927 made note of the remarkable progress recently shown in the adaptation and use of geophysical methods of prospecting. The development of a new field of applied geology seems to be in prospect, in fact the use of these methods has already attained a prominent place in the technique of locating and defining structures favorable to the occurrence of oil, as also of detecting the presence of hidden bodies of ores. Descriptions of the instruments and methods employed are given in numerous current publications of the technical press, particularly in the papers of the American Institute of Mining and Metallurgical Engineers contributed to the New York and Boston meetings of the society in 1928.

The subject can only be touched on in this place and it suffices to state that the methods applicable are divisible into four groups in accordance with the physical principles involved. These are (1) magnetic, (2) electrical, (3) gravitational, (4) seismic. The magnetic method, which makes use of the magnetic anomalies occurring in vicinity of certain kinds of ores, has been employed for some time, but the others are essentially new. The seismic and gravitational methods seem to be particularly adapted to tracing the variations of structure in the sedimentary rocks, and accordingly are being extensively adopted by oil companies for explora-

tion in fields where the surface conditions afford little clew to the stratigraphic arrangement in depth. It is not to be understood that the new technique is a complete substitute for geological field study, rather it is an adjunct to such study which is required both to select areas suitable for exploration and to interpret its results.

I. W. Jones brought under critical review the use of carbon ratios in coals, that is, the proportions of fixed to volatile carbon, as an indicator of the distribution of oil and gas deposits. In western Canada, coals occur with carbon ratios of 55 or 60 per cent, approximately the same as shown by the eastern Appalachian carboniferous coals, although the latter have undergone much greater dynamic metamorphism. The carbon ratios do not accord with the ranks of coal in that region, and it is likely that the variations in fixed carbon content may arise in part from original differences in composition of the coal-forming plants. Consequently, high fixed carbon does not necessarily imply the absence of oil and gas accumulations.

GEOPHYSICS. See GEOLOGY.

GEORGETOWN UNIVERSITY. A Roman Catholic institution of higher education for men, at Washington, D. C., founded in 1789. In the autumn of 1928 there were 2509 students enrolled, with a distribution as follows: Arts and sciences, 981; medical, 468; dental, 124; law, 461; and foreign service, 475. The faculty numbered about 350. The Riggs Memorial Library contained 162,476 volumes; the Hirst Library, 9,123; and individual libraries maintained by the professional schools, many additional volumes. During the year numerous improvements were made on the campus. President, the Rev. W. Coleman Nevils, S.J., Ph.D., D.D.

GEORGE WASHINGTON UNIVERSITY. A coeducational institution of higher learning in Washington, D. C., founded in 1821. The enrollment for the first term of the year 1928-29 was 5308, divided as follows: Columbian College, 2600; graduate school of letters and sciences, 335; school of medicine, 290; law school, 686; school of engineering, 402; school of pharmacy, 59; school of education, 673; school of government, 72; division of library science, 101; division of fine arts, 90. The summer session for 1928 had a total enrollment of 1416. The faculty numbered 346. The endowment fund amounted to \$1,081,546, from which the income for the year was \$42,417. The total income from all sources was \$921,367. The total number of volumes in the University library, including the law and medical libraries, was 80,000. In the autumn of 1928 the school of government was opened, offering a general course in government and a foreign service course. President, Cloyd Heck Marvin, Ph.D., LL.D.

GEORGIA. POPULATION. According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 2,895,832. The estimated population on July 1, 1928, was 3,203,000. The capital is Atlanta.

AGRICULTURE. The table in the next column gives the acreage, production, and value of the principal crops in 1927 and 1928.

MINERAL PRODUCTION. Clay products, stone, and raw clay again made up the great bulk of the yearly mineral production. Coal, while still produced, was on a minor and decreasing scale. There was considerable output, on the other

Crop	Year	Acreage	Prod. bu.	Value
Cotton	1928	3,719,000	1,020,000*	\$92,820,000
	1927	3,413,000	1,100,000*	106,700,000
Corn	1928	3,620,000	38,010,000	39,910,000
	1927	3,393,000	54,502,000	44,147,000
Tobacco	1928	122,300	84,387,000	11,175,000
	1927	81,500	59,088,000	11,440,000
Hay	1928	811,000	521,000*	8,077,000
	1927	825,000	582,000*	9,481,000
Peanuts	1928	350,000	189,000,000	8,316,000
	1927	304,000	220,400,000	8,596,000
Oats	1928	265,000	5,800,000	4,505,000
	1927	442,000	9,282,000	6,962,000
Potatoes	1928	22,000	1,682,000	1,934,000
	1927	17,000	1,804,000	2,152,000
Sweet potatoes	1928	119,000	10,234,000	8,699,000
	1927	132,000	10,560,000	7,920,000
Peaches	1928	10,000,000	8,100,000
	1927	5,943,000	8,023,000
Wheat	1928	94,000	1,034,000	1,727,000
	1927	125,000	1,150,000	1,782,000

* bales, * pounds, * tons.

hand, in 1926, among a list of lesser products which included baryte (total for 1926, \$532,706), bauxite (108,650), fuller's earth (of which Georgia was the leading producer), lime, mica, talc, manganese, and manganese ores. The total of clay products was \$5,957,486 for 1926; for 1925, \$6,369,227. Stone rose to a production of \$5,470,561 for 1926, as against \$4,971,493 for 1925; in quantity, 820,570 short tons for 1926; for 1925, 734,140. There were slight yields of gold and silver. The total value of the State's mineral products was \$17,479,967 for 1926; for 1925, \$16,503,741.

FINANCE. State expenditures in the year end-December 31, 1927, as reported by the United States Department of Commerce, were: for maintenance and operation of governmental departments, \$19,859,437 (of which \$8,191,503 was aid to local education); for interest on debt, \$308,832; for conducting public service enterprises, \$6321; for permanent improvements, \$13,255,537; total, 33,430,127 (of which \$15,138,307 was for highways, \$2,365,501 being for maintenance and \$12,772,806 for construction). Revenues were \$29,262,206. Of this the property and special taxes provided 24.3 per cent; departmental earnings and charges for officials' services, 8.1 per cent; sales of licenses and a tax on gasoline, 42.0 per cent. Property valuation was \$1,275,197,929; State taxation thereon, \$6,375,990. Net State debt was \$9,249,316 on December 31, 1927.

TRANSPORTATION. The total number of miles of railroad line under operation on Jan. 1, 1928, was 6835.40. There were built in 1928, 5.24 miles of additional second track.

EDUCATION. The operation of the \$1,000,000 State equalization fund was reported by a writer in the *Journal of the National Education Association* as having begun to show results in the direction of increased efficiency in the working of the rural schools. There were enrolled in the public schools in the academic year 1926-27, 692,907 pupils. Of these, 614,386 were in elementary schools and 73,999 in high schools. Salaries of teachers averaged: white, \$758.13; Negro, \$289.84; all teachers, \$648.46.

CHARITIES AND CORRECTIONS. The chief of the State charitable and correctional institutions operating in 1928 were the State Training School for Boys, Confederate Soldiers' Home, State Sanitarium, Training School for Mental Defectives, Academy for the Blind, and School for the Deaf. The State Sanitarium (mental) had 4936 patients as inmates on Jan. 1, 1928. There had

been admitted in the year previous, 965. The Training School for Mental Defectives had 91 inmates on January 1, and had admitted 29 in the year preceding.

POLITICAL AND OTHER EVENTS. Chairman Holder, of the State highway department, stated in July that the highway board had either completed or had under construction four paved highways reaching from border to border of the State. The Coastal Highway, extending from Savannah to the St. Mary's River, was opened July 11. The road running to the Alabama line at West Point was likewise completed in the early part of the year. The suicide of a postmaster at Douglas, involved in money difficulties, and a declaration left by him to the effect that he had been driven to the wall by contributions levied upon him by persons connected with the Republican State organization, led to the institution of a Federal Senate inquiry into the subject of levies exacted by political party organizations in the South in return for grants of Federal patronage (See UNITED STATES, *Congress*). A peach standardization law of the State went into effect, placing in a select class all peaches of two inches or more in diameter.

The State Tax Commissioner, in a document of April 30, urged the enactment of a State personal income-tax law modeled on that of Virginia, as the basis of State revenue. It was announced in May that Italian interests had undertaken the establishment of a rayon plant to cost ultimately about \$10,000,000, at Rome, Ga. Floods in southern Georgia drove several thousand inhabitants from their homes late in April. The relief statue of Lee on Stone Mountain was unveiled April 9. Experiment in the commercial growth of bamboo was made near Savannah.

At Atlanta, work was begun on the foundations of a new city hall, at Washington and Mitchell streets, to cost about \$1,278,000. The construction of a number of viaducts to eliminate grade crossings within the city was carried on. The Nashville, Chattanooga & St. Louis Railroad negotiated with the State public service commission on the demand that the railroad build a new passenger station in the city. The city council on May 7 passed an ordinance to withdraw from the city bond commission the power to veto bond issues. Proposal of a referendum on abandoning the city's system of junior high schools was vetoed April 4 by Mayor Ragsdale.

ELECTION. In the election of November 6 the voters of the State gave a majority, substantial although much below normal, for the Democratic Presidential candidate, Gov. Smith. The vote was: Smith, 129,602; Hoover, Republican, 99,369. The Republican popular vote was more than treble that cast for Coolidge in 1924, but the total Democratic vote of the State was also, though by comparison slightly, increased. In Georgia as in other normally Democratic States, there was waged an organized opposition to Governor Smith within the membership of his own party, on personal grounds and particularly on the avowed score of his stand on Prohibition. The effect of religious antagonism was also asserted, although less measurable. Against efforts to induce voters to knife Governor Smith was invoked Rule Two of the State Democratic organization, as implying in those who had voted in

the party primaries a pledge of obligation to support the party nominees in the general election. Governor L. G. Hardman, Democrat, was reelected. All twelve of the State's delegation in the United States House of Representatives were reelected; all were Democrats.

OFFICERS. Governor, L. G. Hardman; Secretary of State, Geo. H. Carswell; Attorney-General, George M. Napier; Treasurer, W. J. Speer; Auditor, S. J. State; Comptroller-General, W. A. Wright; Superintendent of Education, M. L. Duggan (appointed to fill unexpired term of Fort E. Land, deceased); Commissioner of Agriculture, Eugene Talmadge; Commissioner of Commerce and Labor, H. M. Stanley.

JUDICIARY. Supreme Court: Chief Justice, Richard B. Russell; Associate Justices, Marcus W. Beck, Samuel C. Atkinson, H. Warner Hill, S. Price Gilbert, James K. Hines.

GEORGIA (GEORGIAN SOCIALIST SOVIET REPUBLIC). One of the three Transcaucasian republics that emerged after the Russian Revolution of 1917. After 1918 it was an independent republic; since 1921 it has been known as the Georgian Socialist Soviet Republic, and with Armenia and Azerbaijan, forms the Transcaucasian Federal Republic which is affiliated with the Union of Soviet Socialist Republics (see RUSSIA). Georgia is situated in Transcaucasia between the Black and Caspian seas and is bounded on the north by the Caucasus, on the east by the Republic of Azerbaijan, and on the south and southwest by Armenia and Turkish territory. Capital, Tiflis. Area, 39,000 square miles; population, according to the census of 1926, 2,660,963. The chief cities with their populations are Tiflis, 283,000; Kutais, 85,151; Sukhum, 61,974; and Poti, 20,741. At the end of 1925 there were 211,210 pupils attending the public schools, including 1600 students in the higher educational institutions.

The chief pursuit is agriculture, which engages about 90 per cent of the people. The methods are very primitive. The large estates have been divided among the peasants, the minimum allowance for any one family being about 17 acres. Corn, vine growing, and the raising of fruits are the principal agricultural pursuits. Silk production and beekeeping are long-established activities. The chief mineral production is that of manganese, around Tchiaturi, where the greatest deposits of this mineral in the world are found. The industry was virtually ruined during the World War, but is gradually resuming its pre-war production. Other mineral deposits are coal, naphtha, copper ore, lead, and iron ore. All the basic industries were nationalized by the Soviet Government. The railways, which are all state owned, total 570 miles.

GEORGIA SCHOOL OF TECHNOLOGY. A State institution of higher education at Atlanta, Ga.; founded in 1888. For the autumn of 1928 the total number of collegiate day students was 2144. The registration for the summer school of the year was 544, and the number of members of the faculty in the autumn of 1928 was 157. The endowment of the institution amounted to \$200,000, and the income from the appropriations and fees was \$553,000. The library contained 23,000 volumes. President, Marion Luther Brittain, LL.D.

GEORGIA, UNIVERSITY OF. A State institution of higher education for men and women at Athens, Ga.; chartered in 1785 and opened in

1801. In the autumn of 1928 there were 1738 enrolled, and there was an attendance of 2667 students in the summer session. The faculty for 1928-29 numbered 102 members. The productive funds of the University amounted to \$425,000, and the income for the year from the State and other sources was \$400,000. The library contained 63,000 volumes. During the year a commerce and journalism building was completed at a cost of \$215,000. President, Charles M. Snelling, Sc.D.

GERMAN COLONIES. During the World War all the overseas possessions of Germany in Africa, the Pacific Ocean, and the Far East were captured by the Allies. In Africa they included German East Africa, German Southwest Africa, Kamerun, and Togo. All of these were divided between Great Britain and France, Southwest Africa being annexed to the Union of South Africa. In the Pacific were New Guinea, including Kaiser Wilhelmsland, Bismarck Archipelago, German Solomon Islands, Nauru, Caroline Islands, Marshall Islands, Marianne or Ladronne Islands (with the exception of Guam), and German Samoa. In the Far East there was only the German possession of Kiaochow. The total area of the German colonies was estimated at 1,140,117 square miles and the total population was estimated at 13,258,000. See principal titles mentioned above, also TANGANYIKA TERRITORY, and KENYA COLONY.

GERMAN EVANGELICAL SYNOD OF NORTH AMERICA. See EVANGELICAL SYNOD OF NORTH AMERICA.

GERMANIC LANGUAGE AND LITERATURE. See PHILOLOGY, MODERN.

GERMAN LITERATURE. There were some indications in the German book-world of 1928 that the chaotic state of literary production since the War was yielding to a saner outlook upon life and an acceptance of the great change in the economic and social conditions of the people in the German Republic. Writers of the older generation had reappeared on the book market and their works did not show a perceptible decline of their creative faculties. Fiction dominated, as it has always done. Drama was not represented by any outstanding work, and poetry seemed to be less favored than before; but biography and literary studies were presented by a great number of writers of varying merit.

FICTION. Among the authors of pre-war reputation Walter von Molo has written a very unusual book: *Die Legende vom Herrn*, a life of Christ in the form of fiction. Arthur Schnitzler's *Therese* limns the character of the heroine and tells her pathetic story in the author's usual pessimistic vein. Max Dreyer seems definitely to have deserted drama; his latest book is the novel *Das Himmelbett von Hilgenloh*. Wilhelm Schmidthohn's *Mein Freund Dei* is a charming story of an interrupted tour of the world. Wilhelm Hegeler has woven a story about Goya: *Goya und die Bucklige*. Wilhelm Wiegand's *Fahrt zur Liebsinsel*, Karl Hans Strobl's *Zwei Saltzenbrod*, Arthur Brausewetter's *Halbseele*, Franz Adam Beyerlein's story of East Prussia, *Der Brückenkopf*, Alfred Brust's *Jutt und Jule*, Stefan Grossmann's *Chefredakteur Roth führt Krieg*, Willy Seidel's *Der neue Daniel*, and Korfiz Holm's *Herr ist Trumpf* maintain the old standard of their work. Jacob

Wassermann, who seems to have won a certain following among American readers, has published *Der Fall Maurizius*.

A striking individuality among German women writers, Helene Böhlau has returned to the milieu which first made her famous, old Weimar, in *Die kleine Goethemutter*. Short stories have come from Isolde Kurz whose *Stunde des Unsichtbaren* touches the realm of occultism, Rainer Maria Rilke: *Erzählungen und Skizzen aus der Frühzeit*, Irene Forbes-Mosse: *Don Juan's Töchter*, Herbert Eulenburg: *Casanova's letzte Abenteuer*, Jacob Schaffner: *Föhnwind*, suggesting his native Switzerland, Hermann Stehr: *Abendrot* and others. Among the writers who have come into prominence since the War, perhaps none is better known than Franz Werfel, whose *Abiturientag* deals with the problems of the adolescent now so much favored in fiction and drama. Another book of that kind is Hans Carossa's *Vervandlungen einer Jugend*. Even so popular a novelist as Rudolf Stratz deals with these problems in *Der Unbekannte*. A constructive contribution to this literature of adolescence is Willy Speyer's *Der Kampf der Tertia* which pictures an ideal boys' school.

As a master work of modern thought in the old form of fiction has been hailed Bruno Frank's *Politische Novelle*. Hermann Unger's *Die Klasse* tells the tragedy of a teacher's life. A charming story of childhood is Eduard Reinacher's *In den Kinderschuhen*. Felix Riemkasten's *Alle Tage Gloria* is a delightful record of a child's first three years by a happy father. Wilhelm Vershofen's *Svennenbrügge* is a book of tales of the northern heath; Georg Edward's *Passatwind*, of the West Indies. Annette Kolb, a writer of Franco-German descent is the author of the novel *Daphne Herbst*. Hans Friedrich Blunck's *Gewalt über das Feuer* is "a myth of God and man." Oscar Maria Fontana, a Viennese of Dalmatian descent, cultivates the south-Slavic material with such success that the city of Vienna awarded him a prize for his novel *Gefangene der Erde*. Wolfgang C. Ludwig Stein has written a delightfully humorous work in the form of a diary, with the curious title, *Des Freiherrn Knote von Knöteringshausen Europäischer Karneval oder der Typhonische Stern*. A posthumous book by Hermann Sudermann, *Purzelchen*, a tale of youth, reflects the genial humor of his age. Arnold Zweig's *Pont und Anna*, although full of possibilities, fails of attaining the power of his *Sergeant Grischa* by a deplorable tendency to play with style.

The holiday season brought a number of new works by older authors like Ernst Zahn, whose *Tochter Dodais* is a song of the woman's soul, ardent, yet reverent in spirit; Jakob Schaffner: *Der Mensch Krone*, Georg von Ompeda, whose *Sonntagskind* is a charming autobiographical story of his youth, Heinrich Mann, whose *Du-genie oder die Kriegszeit* is a story of the 1870 period, and Fedor von Zobeltitz, whose novel *Der Mann im feurigen Ofen* does not show any decline in the septuagenarian author. Among the younger men, Hanns Johst published a volume of retrospective *Bekenntnisse*, Otto Flake outlined in *Freund aller Welt* the leading type of a new public conscience, and Hans Franck in his stories, *Recht ist Unrecht*, struck the familiar analytical note. Gerhart Hauptmann's latest novel, *Wanda* is conceived in the spirit of al-

truism which distinguishes many of his works, but is hardly of wide appeal.

DRAMA. Since the time of Grillparzer, who inspired by Calderon wrote his *Der Traum ein Leben*, sixteenth and seventeenth century Spanish drama has attracted the attention of German dramatists. Hugo von Hofmannsthal's *Der Turm* is directly based upon Calderon's *La vida es sueno*, but injected into the theme his modern destructive psychology. Another poet, Alfred Wolfenstein in his *Celestina*, has gone back to the tragi-comedy, *De Rojas Celestina*, by the sixteenth century playwright, Calisto y Melibán. F. Walther Ilger's *Gräfin Dubarry* is a tragi-comedy suggesting the dawn of the coming revolution in a picture of the dying rococo. Edwin Guido Kolbenheyer's *Heroische Leidenschaften* presents the tragedy of Giordano Bruno. Ernst Lissauer has gone into an even remoter past in his play *Das Weib des Jephtha*. Gerhard Menzel's *Toboggan* is a *danse macabre* in nine scenes, being the story of a man supposed to be dead and unable to find his way back to the world of the living. Eugen Ortner's *Meyer Helmbrecht* is the tragedy of a peasant boy who sets out to become a knight. Hermann Bahr has published a "dramatic dialogue," *Himmel auf Erden*. Lion Feuchtwanger, who is known in America through translations of his fiction, has written three plays on Anglo-Saxon themes: *Angelsächsische Stücke*. Walter Bähr's one-act plays *Dreikland der Liebe* are, like most of the works of the younger men, products of a cool, analytical mind and lack the warmth of real blood. Ernst Lissauer, so far known only as a poet, essayist, and writer on music, has written a Biblical drama, *Das Weib des Jephtha*, which was very favorably received.

The latest premières of the year were Hermann Ungar's *Der rote General*, a play in which a modern theme was treated in the most approved old manner, and Ernst Fischer's *Lenin*, a drama curious through its dualism, being at once a tragedy and the song of songs of revolution.

POETRY. Anton Wildgans has for some years been rising to fame. His *Kirbisch, oder der Gendarm, die Schande, und das Glück* is in spite of its awkward title a strong work. Hans Heinrich Ehrler's sensitive personality is evident from his poems *Gesicht und Antlitz*. Paul Wertheimer's *Der Triumph des Eros* made Ernst Lissauer remark that it dealt more with "sexus" than "Eros." E. Kurt Fischer's *Masuren* conveys the atmosphere of its East Prussian milieu. Ruth Schaumann, poet-artist, has published two books, *Der Rebenhag* and *Die Rose*. Rudolf Borchardt's *Die Schöpfung der Liebe* is a book of love lyrics of a finer character than most verse of its kind. Readers who had known Max Dauthendey since his first appearance in the nineties welcomed his *Ausgewählte Lie der aus neun Büchern*. Isolde Kurz, the gifted poet and novelist, has published *Der Ruf des Pan*, two poems of life and death. The collected works of Christian Wagner, a poet who rose from the ranks of the people, and two new books by Frieda Schanz sounded echoes of the poetry of the early nineties.

BIOGRAPHY. The Tolstoy centenary brought forth several works of merit, among them René Fülöp-Miller's *Der unbekannte Tolstoy*, officially sanctioned by the family, which contains three hundred pages by Tolstoy himself, fragments of an unfinished novel, some short stories and other works. Philip Witkop's *Tolstoy* is a simple record

of his life and works with many illustrations. Paul Birukoff's *Vater und Tochter* presents the correspondence between Tolstoy and his daughter Marie. Emil Ludwig's much disputed book on Christ, *Der Menschensohn*, is known in America through a translation. Friedrich Gundolf's *Paracelsus* presents the supposed prototype of Goethe's *Faust* as "the most original and perhaps most powerful German soul of the Reformation." Franz Strunz has written a record of the life and work of Wiclif's Bohemian disciple: *Jan Huss*. Friedrich von Oppeln-Bronikowski's *David Ferdinand Korff* traces the influence of this poet and magnetist upon the romantic movement. Hans von Müller's book on *E. T. A. Hoffmann und Jean Paul*, dealing with the same period, shows the mutual relation of these men and that to the women of their circle, among them the poet, Wilhelmina von Chezy. Erwin Rieger pays deserved tribute to the life and work of *Stefan Zweig*. Heinrich Spiero has written a life of the poet *Gustav Falke*.

A posthumous book by Carl Hauptmann deals with his friendships: *Leben mit Freunden*. Arthur Holitscher's autobiographical *Mein Leben in dieser Zeit* is called the life story of a rebel. Rudolf Presber's *Aus der Jugendzeit* is another autobiography. Walter Ziersch, in a book on *Ludwig Thomas*, calls the pathetic story of his marriage the tragedy of a pine and a palm trying to live in the same soil. Eugen Bagger's *Franz Josef* is a study of the last Austrian emperor's personality. Among the books on Eleonora Duse that have recently been published, E. A. Reinhardt's *Das Leben der Eleonora Duse* is distinguished for his interpretation of her racial personality. Elga Kern has published the first volume of a history of the women who have fought for the rights of her sex: *Führende Frauen Europas*. Herbert Schiller has edited a second volume of the *Briefe an Cotta*. Karl Bahn's *Marianne Willemer* is a contribution to Goethe biography.

HISTORY. An important work is Jacob Burckhardt's *Kultur der Renaissance in Italien*. Interesting is Wolfgang Stammler's *Vonder Mystik zum Barock* which attempts to give a historical survey of the dissolution, fermentation, and beginning clarification of ideas from 1400 to 1600. Franz Pagel has written a pictorial history of Germany: *Deutsche Geschichte in Bildern*. Karl Theodor Strasser writes on *Wikinger und Normannen*.

LITERATURE. Paul Weiglin's *Die dramatische Kunst und Literatur in Deutschland* covers German drama from mediæval plays to the present. Julius Bab's *Das Theater der Gegenwart* reviews the German stage since 1870. Rudolf Tyrolt's *Theater und Schauspieler* is based on the author's close connection with stars of the German stage. Emil Ermatinger's *Krisen und Probleme der neuen deutschen Dichtung* is valuable. Erich Mühsam offers a collection of his critical writings: *Sammlung 1898-1928*. Lou Andreas Salome has written an appreciation of *Rainer Maria Rilke*, Wilhelm Bohn, of *Hölderlin*, Hans Sittenberger, of *Schubert*, Rudolf Gottschalk, of *Spitteler*, Heinrich Schmitt's *Erneuerung des Epos* is a philosophical study of Spitteler's *Olympischer Frühling*. Heinrich Straumann's *Justinus Kerner und der Okkultismus in der deutschen Romantik* is interesting. Curt Sigmund Gutkind's *Frauenbriefe aus der italienischen Renaissance* are of more historical than literary value. Alfred Stern

has written *Der Einfluss der französischen Revolution auf das deutsche Geistesleben*.

PHILOSOPHY, RELIGION, ETC. Friedrich Adolf Voigt has written *Sören Kierkegaard im Kampfe mit der Romantik, der Theologie und der Kirche*, and August Vetter in *Frömmigkeit als Leidenschaft* offers an interpretation of Kierkegaard. Hans Günther's *Jung Stilling* is a contribution to the psychology of German fiction. Franz Spunda's *Griechische Mönche* is a study of Greek Catholicism. Books on Plato were written by Paul Friedländer: *Platon*, and Julius Stengel: *Platon als Erzieher*. Bruno Dressler's *Geschichte der englischen Erziehung* is the first attempt at a history of English pedagogy. Erwin Rieger has compiled a book of selections from Blaise Pascal. Arnold Zweig's *Juden auf der deutschen Bühne* reviews the work of Otto Brahm, Max Reinhardt, and others. Alfred Götz's *Frau von Staël in Deutschland 1803* is a selection of her letters supplementing her book, *L'Allemagne*. The novelist, Georg Herrmann, offers reflections on life and the world in *Die Zeitlupe*; Walter Bloem philosophizes in *Weltgeschichte: ein Buch von heutiger und kommender Menschheit*. An interesting study is Rudolf Kassner's *Narziss oder Mythos und Einbildungskraft*. Hermann Oncken has written on *Politik Kriegsführung*. Ernst Jackh's *Deutschland das Herz Europas* deals with the national foundations of international politics. Alexander von Gleichen-Russwurm in *Die Lust der Welt* reviews the beautiful women of history from Lais of Corinth to the Dame aux Camelias. Martin Buber's *Die chassidischen Bücher* is a key to the understanding of Hebrew philosophy. P. Köhler's *Von der Nibelungen versunkenem Hort* and Hermann Schneider's *Germanische Heldensagen* are contributions to German folklore. Felix Günther's *Schubert's Lied* is an æsthetic study. A few books of travel deserve mention: Ph. C. Visser's *Zwischen Karakorum und Hindukusch*, Bernhard Kellermann's *Auf Persiens Karavananstrasse*, and Schröder-Viborg's book on *Süd-Amerika*. Translations are innumerable.

NECROLOGY. Among the notable German men of letters dying during the year and discussed under their own heads or in the NECROLOGY are; Erich Schlaikjer, actor, dramatist, essayist, died February 11; Hans von Gumppenberg, poet, dramatist, editor, died March 29; Hans Barth, poet and novelist, died March 15; Carl Bleibtreu, poet, novelist, dramatist, and essayist, died January 30; Heinrich Federer, poet and essayist, died April 29; Christian Schmitt, Alsatian poet, died April 28; Arthur Seidl, music critic, died April 13; Ida Boy-Ed, novelist, died May 13; Victor Auburtin, novelist, died June 29; Hermann Sudermann, dramatist and novelist, died November 31. Willie Bruno, the most gifted representative of the nature-cult and philosophy which found in Wilhelm Bölsche a more scientific protagonist, died September 14. His verse and his fiction occupy a place of their own in modern German literature, and he will also be remembered for his active share in the foundation of the *Freie Volksbühne*, which inaugurated a new era in German drama. Heinrich Gassert, author of epics and lyrics, best known through his original college songs, died September 6. Marie Stritt, like Anita Augspurg, for some time an esteemed actress, before becoming an outstanding figure in the Suffrage movement of Germany, died September 18.

See PHILOLOGY, MODERN.

GERMAN NEW GUINEA. This name was applied to all the German territories in the western Pacific (see GERMAN COLONIES). They were distributed by the Treaty of Versailles as follows: Those north of the Equator, viz., the Caroline, Marshall, Palau, and Ladrone Islands, to Japan, under mandate; those south of the Equator, viz., the Bismarck Archipelago, the German Solomon Islands, and former German possessions on the Island of New Guinea, to Australia, under mandate of the League of Nations. All German possessions grouped under the name of German New Guinea were formerly administered from Rabaul, the capital, in the north-eastern part of New Guinea.

GERMANY. A federal republic of Central Europe, constituted after the abdication of Emperor William II on Nov. 9, 1918; and organized under the constitution of July 31, 1919, by the National Assembly at Weimar, elected in January of that year; formerly the German Empire; bounded on the north by the Baltic Sea, Denmark, and the North Sea; on the west by the North Sea, the Netherlands, Belgium, Luxembourg, and France; on the east by Austria, Czechoslovakia, and Poland; and on the south by Switzerland, Austria, and Czechoslovakia. The German Empire consisted of 25 Federal States and the Imperial Reichsland; the Federal Republic consists of 18 republics. The capital is Berlin.

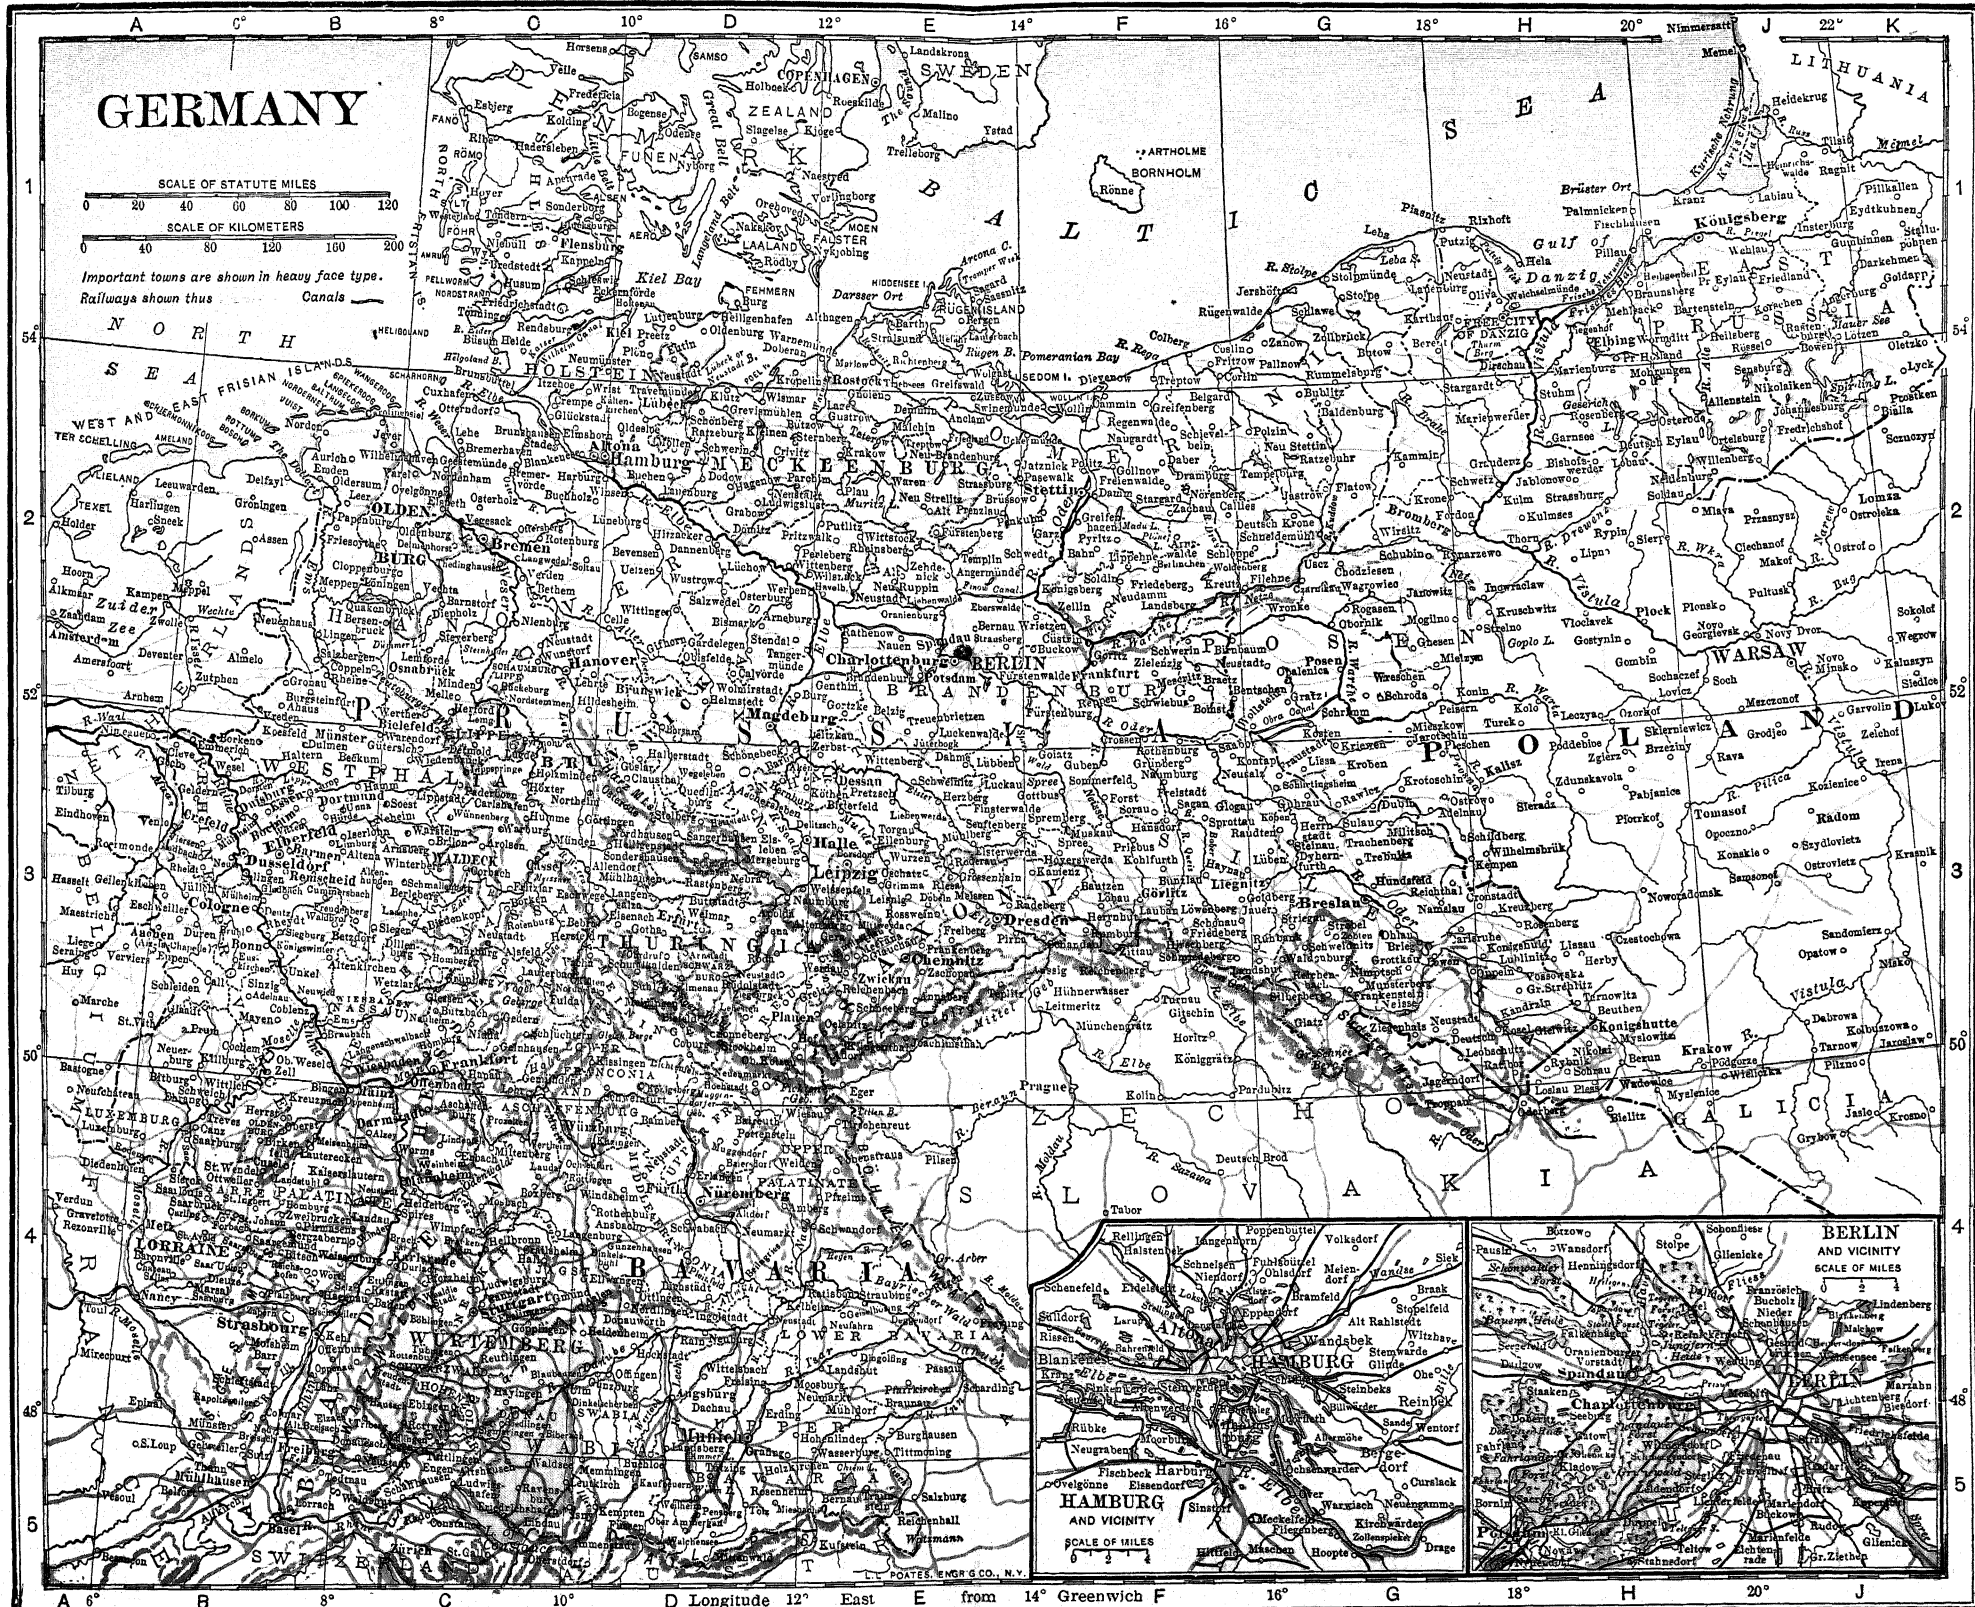

AREA AND POPULATION. At the census of Oct. 8, 1919, the area of the Republic, including the Saar Valley, was 182,213 square miles and the population, 59,852,682, of whom 28,496,419 were males and 31,356,263 females. The accompanying table from the *Statesman's Year Book* for 1928 gives area and population according to the census of June 16, 1925.

States of the Empire	Area English sq. miles	Population June 16, 1925	Pop. per sq. mile 1925
Prussia *	112,628	38,120,173	338
Bavaria *	29,343	7,379,594	251
Württemberg	7,532	2,580,285	342
Baden	5,819	2,312,462	397
Saxony	5,789	4,992,320	863

Prussian Saar District ^b	574	671,748	1,170
Saarpalz ^b	164	98,252	599
Saar District (altogether)	738	770,000	1,043
German Republic (with Saar District) ^b	181,714	63,180,619	347

* Excluding the Saar.

^b The figures for the population of the Saar District, in which the census of 1925 could not be taken, are estimates.

In 1926 the movement of population was: Births, 1,269,419; deaths, 775,878; marriages, 483,198; divorces, 35,451. In 1927, 60,789 German nationals emigrated from the country as compared with 65,280 in 1926. In 1925, 51,145 emigrated to the United States. The cities with more than 500,000 inhabitants at the census of 1925 were: Berlin (including suburbs), 4,024,-

165; Hamburg, 1,079,126; Cologne, 700,222; Munich, 680,704; Leipzig, 679,159; Dresden, 619,157; and Breslau, 557,139.

EDUCATION. Primary instruction is compulsory throughout Germany between the ages of six and 14. According to a school census taken in 1926-27 there were in that year 52,320 public elementary schools with 180,273 teachers (137,124 males and 43,149 females), and 6,629,779 pupils (3,340,804 boys and 3,288,975 girls). The latest figures for private schools of a similar nature were those for 1922 when there were 675 schools with 35,584 pupils (14,986 boys and 20,598 girls). The latest figures for secondary schools are also those of the school census of 1922 when there were for boys, 515 Gymnasias, with 10,051 teachers and 152,367 pupils; Real-gymnasias, 322, with 6678 teachers and 115,615 pupils; Ober-realschulen and Realschulen, 506, with 9404 teachers and 184,175 pupils; for girls, high schools, 824, with 14,852 teachers and 299,285 pupils. There are ten fully equipped technical schools, with the power of granting degrees. These had a teaching staff of 2274 and a student body of 21,683.

The universities, with the number of students in 1926, are as follows: Berlin, 8038; Bonn, 3510; Breslau, 2717; Cologne, 4748; Erlangen, 1330; Frankfurt, 2723; Freiburg, 3147; Gießen, 1327; Göttingen, 2580; Greifswald, 1055; Halle, 1770; Hamburg, 1969; Heidelberg, 2558; Jena, 1972; Kiel, 1820; Königsberg, 1666; Leipzig, 4639; Marburg, 2275; Munich, 6987; Münster, 2532; Rostock, 966; Tübingen, 2679; and Würzburg, 2013. The teaching staff in all of these universities numbered 7234. The 65,021 students were divided among the several faculties as follows: Theology, 3810; jurisprudence, 26,060; medicine and dentistry, 10,100; philosophy, 12,591; mathematics and natural science, 12,094; auxiliary science, 366.

PRODUCTION, INDUSTRIES, ETC. Almost all crops increased in 1927 as compared with the relatively low figures of 1926, yields per acre for most crops differing but little from the five-year period 1921-25. In June, 1927, there were 51,391,290 acres of arable land, 20,005,337 acres of grass, meadows, and pastures, and 201,585 acres of vineyards. The following table from the *Commerce Year Book* for 1928 shows the area and production of the principal crops in 1927:

Crop	Area *	Production ^b
		1927
Wheat	4,321	120,521
Rye	11,610	269,030
Barley	3,653	125,754
Oats	8,589	437,251
Spelt	308	5,070
Potatoes	6,918	1,379,707
Sugar beets	1,073	10,854 *
Fodder beets	1,747	24,389 *
Hay, alfalfa, and clover	18,781	35,407 *

* Thousands of acres; ^b thousands of units—bushels except as indicated; * unit, metric ton.

In 1927 the area devoted to vines was 181,872 acres and the wine yield 31,407,618 gallons; tobacco, 22,835 acres, 14,410,304 kilos in 1926. The sugar production in 1927-28 was 1,662,000 tons. On Dec. 31, 1927, there were 17,982,000 cattle, 22,880,000 swine, 4,080,000 sheep, 3,218,000 goats and 3,805,000 horses.

The 1927 production of minerals in Germany was considerably stimulated by the after effects of the British coal strike as well as by

the country's progressive industrial recovery. The impetus to production contrasted with a low level of output in the first half of 1926, thus accounting for an increase even over the figures for the year of the strike. The entire German pre-war production, of course, was considerably higher in some cases in the larger territory. The post-war territorial partitions chiefly affected the Alsace-Lorraine minette (iron ore) deposits, Pechelbronn petroleum and potash, and Upper Silesian zinc and lead deposits ceded to Poland after the Geneva decision in 1922. Production increases may be observed in the accompanying table, which compares the 1927 figures with those for 1926 and 1913 in the present area.

GERMAN PRODUCTION OF MINERALS

Item	1913 ^a	1926	1927
	Metric tons	Metric tons	Metric tons
Coal	140,753,200	145,295,700	153,599,400

^a Within present borders.

According to the industrial census of June 16, 1925, there were 1,842,913 industrial establishments in Germany, employing 12,482,442 working people, of whom 9,609,629 were males. The industries employing more than 1,000,000 workers were: Engineering, textiles, timber, foodstuffs, clothing, and building.

According to official figures for 1927, there were 674 strikes, which affected 6924 plants; the number of strikers totaled 187,687, as compared with 57,608 in the previous year; lost working days numbered 2,442,694, as against 891,606 in 1926. The number of lockouts was 96, affecting 1918 plants; the number of workers affected was 213,611, and the number of working days lost was 2,176,142. Wage disagreements were the principal source of labor difficulties, and they occurred principally in the textile, mining, and tobacco industries. Disagreements about working time played a considerable part in the machinery and ceramic industries.

COMMERCE. Germany's foreign trade in 1927 was noteworthy for its greatly increased total turnover and the very considerable excess of imports over exports; whereas in 1926 the total trade amounted to 19,734,600,000 marks, that of 1927 aggregated 24,361,800,000 marks. The 1927 deficit, however, reached the figure of 3,924,600,000 marks, whereas in the previous year trade was very nearly balanced. Nevertheless the character of the trade in 1927 may be said to have

been much more normal and healthy than in any other post-war year. It is true, of course, that imports exceeded those of 1926 by, roughly, 4,192,000,000 marks, but such a condition reflected the high degree of activity which characterized practically every line of German industry throughout the year. In addition the 1925 stocks which had contributed so largely to the reduction of the 1926 deficit were exhausted, and, of course, new purchases had to be made abroad.

The import value in 1927 was not only the highest of any post-war year but also the highest ever attained in German trade, even when allowance is made for the increase in prices since 1913. On the basis of the 1913 level, for instance, the imports of 1927 would aggregate 11,400,000,000 marks, which still exceeds the 1913 total of 10,769,700,000 marks. Exports participated also in the general growth of trade in 1927, although, naturally, not to the same extent as imports; they did, however, exceed those of 1926 by 435,300,000 marks and thus reached a record high level for post-war years, with a total of 10,218,800,000 marks. Another and possibly even more encouraging feature with regard to the 1927 figure was that, if it were converted on the basis of 1913 prices, it would amount roughly to 7,600,000,000 marks, or 75 per cent of pre-war exports. This ratio would naturally be higher if it were not for the territorial losses suffered by Germany in 1919.

The high import excess and the greatly increased volume were conditioned in part by the influx of foreign capital as represented by foreign loans contracted during 1927. Then again, the year was for the country as a whole, and for industry in particular, one of general economic progress. This may be seen in the heavy gain in raw-material imports, which also reached a record figure. A rise in the imports of finished goods was also noticeable, but this reflected not only the more prosperous condition of the country but also the general industrial activity, for a large part of these imports included goods which were destined for reexport after undergoing finishing operations.

Despite the fact that imports of foodstuffs were proportionately lower to total imports than in 1926, they showed an absolute gain of approximately 772,000,000 marks. This condition may be traced in part to the fact that relatively unfavorable crops of 1926 and the retarded crops of 1927 necessitated increased purchases from abroad, and in part to the greater consumption of certain foodstuffs. With respect to exports, losses were registered both in foodstuffs and raw materials; the losses in the latter group were, of course, due to restricted sales of coal, whereas these had been exceptionally high in the previous year as a result of the British strike.

During 1927, 11 articles accounted for 78 per cent of the total German imports from the United States. They were: Cotton, 668,800,000 marks; copper, 228,700,000; wheat, 184,600,000; mineral oils, 127,900,000; lard and oleomargarine, 125,500,000; barley, 98,100,000; fruit, 49,900,000; lumber, 39,100,000; rye, 35,700,000; motor vehicles and motor cycles, 35,700,000; resin, shellac, and rubber, 22,700,000. While imports of foodstuffs were practically the same as in 1926, raw materials showed an increase of 360,000,000 marks, in which cotton, mineral oils, and copper took part. The small gain in

German exports to the United States were distributed principally among hides for fur preparation and coal tar and oils. Total imports from the United States were valued at 2,072,900,000 marks in 1927 and total exports to the United States at 776,200,000 marks.

FINANCE. The actual revenues of the Government for the fiscal year 1926-27 (ending March 31) exceeded the estimates to such an extent as to make a surplus of nearly 200,000,000 marks. The estimated budget for 1927-28 was balanced at 8,657,320,000 marks but was expected to show a surplus. According to official figures made public in the spring, the German Government receipts from taxes, customs, and other sources for the fiscal year ended Mar. 31, 1928, amounted to 8,490,395,000 marks, as compared with an estimated 8,460,500,000 marks. The income tax brought in 2,784,300,000 marks as against an estimate of 2,775,000,000; the turn over tax, amounting to 877,600,000 marks, was slightly below the estimated figure of 890,000,000. Similarly, customs returns were slightly below the estimates, aggregating 1,250,900,000 marks as against 1,255,000,000 marks.

The budget for 1928-29 which was not adopted before the close of the year was expected to balance at approximately 10,000,000,000 marks. The increase was largely due to the extra reparations payments demanded from the regular budget during the year. As the year closed it appeared that there would be considerable opposition to the Government's proposals, with the possibility that a temporary budget would have to be adopted because of hostility to the proposals of Finance Minister Hilferding.

Germany's total borrowing in 1927, both long- and short-term, amounted to 1,509,860,000 marks, a decrease of nearly 11 per cent from the high record of 1926 and an increase of 16 per cent over the amount for 1925. Of the 1927 total, 1,383,860,000 marks, or 92 per cent, represented long-term loans. The outstanding feature of the 1927 borrowing was the large increase in long term loans to private enterprises, which were 75 per cent of the total as compared with 46 per cent in 1926, and amounted to 1,038,240,000 marks, an increase of nearly 44 per cent over 1926. There was a corresponding decrease in long-term loans to public bodies and public enterprises, the 1927 total of 331,760,000 marks being less than half that for 1926. The only short-term loans in 1927 were to public bodies and amounted to 126,000,000 marks, compared to a total of 117,600,000 marks in 1926, of which 79,800,000 represented loans to public bodies in that year. Since the Dawes loan of 1924, and up to the end of 1927, German foreign borrowing amounted to 4,544,990,000 marks. Long term loans accounted for 4,250,990,000 marks, or nearly 94 per cent of the total. Of these long-term loans, 56 per cent went to private enterprises, 26 per cent to public bodies, 16 per cent to public enterprises, and 2 per cent to church corporations.

The short-term loans totaled 294,000,000 marks, of which 77 per cent went to public bodies, 17 per cent to private enterprises, and 6 per cent to public enterprises. Although the United States supplied 2,957,880,000 marks, or nearly 70 per cent, of the total long-term loans from 1924 through 1927, its proportion in the yearly total decreased from 74 per cent in 1925 to 64 per cent in 1927.

RAILWAYS. The Government railroads are managed and administered by the German Railways Co., but remain the property of the State. In addition to the State Railways there were 2277 miles of normal-gauge line in 1926, which belonged to private companies. The State Railways showed a great gain in freight traffic in 1927 as compared with preceding years. Tons of freight carried increased by nearly one-fourth over 1926, and ton-mileage by about the same proportion.

^a Including miscellaneous receipts not shown separately.

At the end of the year it was reported that the German Government Railways were becoming rather alarmed over the competition given by automotive vehicles. The railway company estimated that in 1927 this competition cut down the revenues by 250,000,000 marks out of a total income of 5,000,000,000 marks. The estimate of revenue losses for 1928, on account of long-distance transportation of passengers and freight by automotive vehicles, was 400,000,000 marks. The railways certainly felt the fact that the goods which bear the highest freight rates were those which were most transported over long distances by trucks. The railways were in doubt whether to reduce rates in competition with trucks or to set up their own system of automotive transportation in competition with private companies.

SHIPPING. For the year ended June 30, 1927, the merchant marine of Germany consisted of 1990 vessels of 3,363,046 gross tons. In 1926, 69,494 vessels (with freight) of 30,178,212 tons and 16,735 vessels (in ballast) of 7,603,838 tons entered the ports of Germany and 68,257 vessels (with freight) of 30,041,598 tons and 20,242 vessels (in ballast) of 7,412,122 tons cleared.

For ARMY and NAVY see under MILITARY PROGRESS and NAVAL PROGRESS.

GOVERNMENT. Under the constitution of the republic adopted July 31, 1919, and promulgated Aug. 11, 1919, executive power is vested in the president elected by the people for seven years, and in a ministry appointed by him and responsible to the Reichstag or Parliament. Legislative power is vested in the Reichstag, consisting of 493 members, who are elected by universal, equal, direct, secret franchise of male and female voters, on the principle of proportional representation; and in a federal council, the Reichsrat, consisting of 68 members (Prussia, 27, Bavaria, 11, Saxony, 7, Württemberg, 4, Baden, 3, other states, 16). The consent of the Reichsrat is required to all bills before their introduction into the Reichstag, but the latter body may pass a bill over the heads of the former by a two-thirds vote.

The president in 1928 was Paul von Hindenburg, elected Apr. 26, 1925; assumed office,

May 12, 1925. The cabinet was composed as follows: Chancellor and Minister for the Occupied Provinces, Dr. Wilhelm Marx (Centre party); Foreign Affairs, Dr. Gustav Stresemann (German People's party); Home Affairs, Dr. Von Keudell (German National People's party); Finance, Dr. Köhler (Centre); Defense, Lieut.-Gen. Wilhelm Groener; Labor, Dr. Heinrich Brauns (Centre); Food and Agriculture, Martin Schiele (German National People's party); Posts, Dr. Schaetzel (Bavarian People's party); Transport, Dr. Wilhelm Koch (German National People's party); Economic Affairs, Dr. Julius Curtius (German People's party).

HISTORY

SITUATION AT THE BEGINNING OF THE YEAR. The year opened with the Marx cabinet in a rather precarious position because of the continued dispute over the educational bill and the religious question, which have been discussed in previous YEAR BOOKS. About the middle of January a change in the cabinet took place, Dr. Otto Gessler being superseded by Lieut.-Gen. Wilhelm Groener. Dr. Gessler had been the stormy petrel of German politics for a number of years and had caused considerable trouble with the allied countries over the question of the position of the army in Germany. He had served through fifteen successive cabinets since his first appointment in 1919. During the first years of his service he had been bitterly attacked by the Right as being too republican, but in his later years he was attacked by the Left because of his conservatism and his gradual swing to the Nationalists.

THE ELECTIONS. Probably the outstanding event in the history of Germany during the course of the year was the general elections held on May 20, which resulted in decided gains for the Socialist group and corresponding losses for the Nationalist and pro-Kaiser groups. Altogether about 30 parties contested the election. It appeared that the chief issue was the continuation of Foreign Minister Stresemann's policy of international peace and reconciliation. The parties of the Left were naturally in favor of such a scheme, while the parties of the Right were just as naturally opposed to it. The results of the election carried out the expectations of pre-election observers, who predicted a swing to the Left. The Socialists and Communists increased their strength tremendously, while the Nationalists suffered their worst defeat since the establishment of the republic. The Centre party was considerably weakened by the swing to the Socialists and it was apparent on all sides that the Marx ministry would have to go. The Communists polled one-fourth of all the votes in the city of Berlin and increased their seats in the Reichstag from 45 to 54. The Socialists increased their seats from 131 to 152, while the representation of the German Nationalists was reduced from 111 to 73. The German people's party lost six seats and the Centrists seven.

NEW CABINET. As a result of the elections it was found necessary to organize a new cabinet. This was no easy task inasmuch as there was no common ground on which the parties of the Left could unite. The task of forming a government was given to Hermann Müller, the Socialist leader, who had formed a ministry in the early days of the republic, which lasted only a

few months. After laboring almost all the month of June he succeeded in getting together a group which consisted of leaders of five parties, The Socialists, Centrists, Democrats, German People's party, and Bavarian People's party. It was composed as follows: Chancellor and Minister of Labor, Hermann Müller (Socialist); Interior, Carl Severing (Socialist); Finance, Rudolf Hilferding (Socialist); Justice, Alvin Saenger (Socialist); Foreign Affairs, Dr. Gustav Stresemann (German People's party); Economic Affairs, Julius Curtius (German People's party); Food and Agriculture, Hermann Dietrich (Democrat); Defense, Lieut.-Gen. Wilhelm Groener (Centre); Transportation, Joseph Wirth (Centre); Posts, Dr. Schaetzel (Bavarian People's party).

In his introductory speech to the Reichstag, Chancellor Müller stated that the general foreign policy of Dr. Stresemann would be carried on by his government. In touching upon internal affairs the Chancellor was very careful to avoid any reference to the educational and religious issues, but limited himself to promising a reduction in taxation and appealing for the stabilization of German political life. His government was given a vote of confidence by the large majority of 261 to 134. Before it adjourned on July 13, the legislature passed a general amnesty bill releasing several thousand political prisoners, a tax bill reducing income taxes, and measures designed to relieve the financial stringency of the country.

On August 11, the entire country celebrated with appropriate ceremonies the anniversary of the adoption of the Weimar constitution. The balance of the year passed very quietly in German political life. The Reichstag did not reassemble until November 12 and was immediately confronted with a discussion of the budget which was not settled as noted above under FINANCE before the close of the year.

The last month of the year was taken up with a discussion pro and con of the industrial dispute in the Ruhr. The employers refused to accept an arbitral award of an increase in pay and locked out 250,000 workers. The Reichstag appropriated 20,000,000 marks for the relief of the workers, who were out of employment for five weeks. They finally went back on the old wage and hour scale, while the dispute was under advisement of Dr. Severing, Minister of the Interior. His final decision reduced the hours of labor and granted a wage increase which was below that of the original award of the arbitration commission. In the meantime the original award and the entire fabric of the Arbitration Law was to be passed on by the Supreme Court. This was not done before the close of the year. Upon the decision of the court rested the entire governmental control of disputes between workers and employers. Up to this time decisions reached under the law had been accepted by both sides.

GIBRALTAR. A possession of Great Britain on a small peninsula, comprising the Rock of

Gibraltar, on the southwest coast of Spain, commanding the entrance to the Mediterranean Sea. Area, $1\frac{1}{2}$ square miles; population, at the census of 1921, 20,638, of whom 2932 were military and 546, naval. On Jan. 1, 1927, the fixed population was estimated at 16,150, and there were also about 1153 aliens. The inhabitants are chiefly descendants of Spanish and Italian settlers, and in religion are Roman Catholics. Education is compulsory between the ages of 5 and 14. In 1926-27 there were 13 Government-aided elementary schools with 2630 pupils. There are also five secondary schools. The revenue in 1926 was £158,636 and the expenditure, £147,942. Trade is mainly transit. Vessels entered in 1926, 4327 of 6,121,288 tons; cleared 2269 of 5,318,496 tons. There is cable connection with the continent, with eastern Mediterranean ports, and with England. Gibraltar is under a governor who is also commander-in-chief. He is assisted by an executive council which was established in 1922. Governor in 1928, General Sir Charles C. Monro.

GIFTS AND BENEFACTIONS. See UNIVERSITIES AND COLLEGES.

GILBERT, HENRY F. An American composer, died in Boston, May 19. He was born in Somerville, Mass., Sept. 26, 1868. After graduation from the New England Conservatory, in 1888, he continued his studies in composition for three years with McDowell. His first compositions, which were published by the Wa-Wan Press, of which he was one of the founders, are the earliest impressionistic works by an American composer. At the time they attracted little attention. An exhaustive study of Negro and Indian melodies brought about a complete change of his style. With his *Comedy Overture on Negro Themes* (1906) he abandoned forever the vagueness of impressionism and developed an individual style characterized by simplicity of melodic and harmonic structure. This overture, which gained for its composer national recognition, was followed by other orchestral works: *Americanesque* (1907), *American Dances* (1911), a symphonic poem, *Dance in Place Congo* (1912), *A Negro Rhapsody* (1913), and a symphonic prologue, *Riders to the Sea* (1914). In the latter the composer employs Celtic folk-songs. Other works are *Salammbô's Invocation to Tanith* (for soprano and orchestra), *Indian Sketches* (for chorus and orchestra), a few piano compositions, and songs. The great popularity of the *Dance in Place Congo* induced the author to expand the work into a ballet which was produced at the Metropolitan Opera House, New York, in 1918.

GIOLITTI, GIOVANNI. Italian statesman, five times premier of his country, died at Cavour, Italy, July 17. He was born at Mondovì, Italy, Oct. 27, 1842, and was educated at Turin. As a young man he entered the service of the finance department of the Government, and he had reached the post of chief inspector when he was elected to the Chamber of Deputies in 1874. In 1889 he became minister of the treasury and in the following year minister of finance, which position he was compelled to resign soon afterward because of his policy of extreme economy. After the fall of Rudini, whose financial policy he had stoutly opposed, Giolitti became prime minister for the first time, in May, 1892. Although constantly opposed by the Chamber of Deputies, Giolitti, in his first term as premier, succeeded in introducing many needed reforms

in favor of the lower classes. In November, 1893, he resigned on account of the bank scandals, and especially on account of his friendly relations with Tanlongo, director of the Banca Romana, who had issued duplicate notes and had corrupted government officials, and whom Giolitti had appointed to the Senate. A parliamentary investigation acquitted Giolitti of personal dishonesty, but his retirement was forced. He remained in retirement several years, but in 1901 returned to power as minister of the interior in the Zanardelli cabinet. He was the real head of the Government, and, when Socialist agitation compelled Zanardelli to retire, Giolitti became premier, for the second time, in October, 1903, after he had resigned as minister in 1901. Before taking the portfolio as premier he had favored the Socialists, but once he was seated in the highest place of power he opposed them, and they forced him out in March, 1905. His third premiership began in May, 1906, when he succeeded Sonnino, and he held the office until December, 1909. Another term as prime minister followed before the World War. It terminated Mar. 4, 1914, after his colonial budget had been defeated. When the War broke out in August, 1914, he was in favor of a strict neutrality on the part of Italy, and when the question of participation by his country against her former partners in the Triple Alliance became acute in 1915, he attempted to overthrow the Salandra cabinet, which favored Italian entry into the War. Giolitti's influence in Parliament was strong, but the people of Italy were for war and his opposition failed. Throughout the course of the War, he was looked on as a "defeatist," and was out of favor, but the unsatisfactory peace conditions and the post-war troubles of Italy brought him once more into power, in May, 1920. His stay in office was short (until April, 1921), and was marked by a successful foreign policy. The internal programme was dominated first by the Socialists and then by the Fascists. He was defeated in the election of April, 1921, and resigned in June of the same year. Thereafter he played no large part in public life, but the Matteotti affair brought him forward again as a moderate opponent of the Fascist régime. He advocated parliamentarianism as against Mussolini's "strong man" ideas. Mussolini and his followers seemed to regard Giolitti as an "elder statesman" with antiquated notions of government, and treated him with tolerance. In 1922 he published *Memories of My Life*, in two volumes.

GIRL SCOUTS. A non-sectarian organization for girls started in Savannah, Georgia, in 1912, and incorporated under the laws of the District of Columbia in June, 1915. The plan for Girl Scouting is not a copy of the Boy Scout programme, although both organizations were founded by Sir Robert Baden-Powell, but it is rather a development of the Girl Guide movement, changed and adapted to meet the needs of American girls. The purpose of the organization is to help girls to realize the ideals of womanhood, as a preparation for their responsibilities in the home and service to the community; it aims to give girls, through natural, wholesome pleasures, those habits of mind and body which will make them useful, responsible women, to develop initiative, self-control, self-reliance, and service to others. When a girl becomes a scout she makes the following promise: "On my honor, I will try; To do my duty to God and my Country; to help

other people at all times; to obey the Scout Laws."

The unit of the organization is the troop, which is composed of one or more patrols. There are eight girl scouts in each patrol. The activities of the troop are developed through the Patrol System, under a Patrol Leader who is appointed from the group. The girls advance by a merit system which was developed by Sir Robert Baden-Powell.

The total active membership of the organization as of Sept. 30, 1923, was 186,634. There are 12 summer national training schools for Girl Scout leaders and young women who are interested in training for volunteer leadership. During 1927, 930 young women attended these schools. Continuing the work which was established as the result of a five-year experiment of giving Girl Scout training courses in colleges and institutions of higher learning, made possible by an appropriation from the Laura Spelman Rockefeller Memorial, it was further possible, through a contribution from the Julius Rosenwald Fund, to conduct, from October, 1927, to May, 1928, Girl Scout training courses in volunteer leadership in 38 different colleges and institutions of higher education, in 22 States, with an enrollment of 1330. Other training courses were given either locally or through educational institutions to 6505 Girl Scout leaders, who were encouraged to take up Girl Scout work in their own communities after leaving college. The Girl Scout programme extended to 27 leading counties in 1928. The official organ for Girl Scouts is *The American Girl Magazine*, and for leaders, *The Girl Scout Leader*, each a monthly publication. The budget for the year 1929 totaled \$367,327. The officers for 1929 are: Mrs. Calvin Coolidge, honorary president; Mrs. William H. Hoffman, president; Mrs. Herbert Hoover, first vice-president; Mrs. Arthur O. Choate, Mrs. Julius Rosenwald, Mrs. Vance C. McCormick, Mrs. Frederick Edey, Mrs. A. Clifford Shinkle, Mrs. William M. Chester, vice-presidents; Mrs. Nicholas F. Brady, chairman of board of directors; Mrs. Edgar Rickard, treasurer; Mrs. Julius H. Barnes, corresponding secretary; Mrs. Jane Deeter Rippin, national director; Chauncey Belknap, counsel. The national headquarters are at 670 Lexington Avenue, New York City.

GODDARD, PLINY EARLE. American anthropologist, died at Newtown, Conn., July 13. He was born at Lewiston, Me., Aug. 24, 1869. He was graduated from Earlham College, 1892, and received his Ph.D. from the University of California in 1904. He was instructor in anthropology at the University of California, 1901-06, and assistant professor, 1906-09; then he became associated with the American Museum of Natural History, New York City, first as assistant curator of anthropology, 1909-10, then as associate curator, 1910-14, and from 1914 until his death as curator. He was also a lecturer on anthropology at Columbia University. He was a member of the American Anthropological Society and of the American Folk-Lore Society, and a fellow of the American Academy of Arts and Sciences. He wrote: *Life and Culture of the Hupa* (1903); *Hupa Texts* (1904); *The Morphology of the Hupa Language* (1905); *The Phonol-*

ogy of the Hupa Language (1907); *Kato Texts* (1909); *Indians of the Southwest* (1913). He was joint editor of *The International Journal of American Linguistics*.

GOETHALS, GEORGE WASHINGTON. American military and civil engineer, engineer in chief of the Panama Canal, and first civil governor of the Panama Canal Zone, died at New York, January 21. He was born at Brooklyn, N. Y., June 29, 1858. After studying at the College of the City of New York, he entered the U. S. Military Academy. He was graduated in 1880 second in his class, and was appointed a second lieutenant in the Corps of Engineers, United States Army. After completing a special course in engineering at the Engineer School at Willets Point, where he remained two years, Lieutenant Goethals was assigned in 1882 to duty as engineer officer of the District of Columbia. Later in 1882 he was made a first lieutenant and received his first important engineering duty as assistant to the officer in charge of the improvements on the Ohio River near Louisville, Ky. A year later he was back at West Point as assistant professor of military engineering, and in 1888 he became principal assistant professor, remaining at the Military Academy another year.

His greatest task before the construction of the Panama Canal was, in his own opinion, the improvement of the Tennessee River below Chattanooga, Tenn., and the building of the canal around Muscle Shoals. He was made a member of the board of fortifications, and in 1903 a member of the general staff of the United States Army. In 1907 President Roosevelt, having decided that all bids for the construction of the Panama Canal should be rejected, and that, instead of leaving the work in charge of a civilian commission, the Government should undertake the construction, he appointed Goethals (then a colonel) chairman, as well as chief engineer, of a new commission, composed on its technical side of army and navy officers. An able engineer, familiar with the conditions attending the prosecution of government work, and a man of force and resources, strong in personality and able to inspire confidence and energy in others, Colonel Goethals straightway developed a system by which the building of the Canal could be done and the many allied problems could be solved. He soon had the entire work of design organized, so that the actual construction could be undertaken at a rate not before realized—a rate which constantly improved with the progress of the canal.

Colonel Goethals, who regarded his work as that of an administrator rather than as that of an engineer, and who possessed a peculiar genius for detail, received ample executive powers. Largely through the exceedingly important services of the late Gen. William C. Gorgas, of the U. S. Army Medical Department, the questions of sanitation, commissary, housing, and labor were all satisfactorily answered, and a complete social fabric, as well as a construction organization, was developed. The Panama Canal came to be known as a scene of industrial contentment no less than as a piece of sound engineering and a model of efficient labor. So vigorously was the work prosecuted that its virtual completion was possible in 1914, although the time schedule had called for completion in June, 1915. Colonel Goethals received unstinted praise from visiting engineers and from the technical

press of the entire civilized world. In 1913 the degree of LL.D. was conferred on him by the University of Pennsylvania, and in the spring of 1914 he was awarded medals by the National Geographic Society and the Civic Forum (New York) and the National Institute of Social Sciences.

Late in 1913 and early in 1914 he was much in demand for various administrative positions. He declined the police commissionership of New York and the city managership of Dayton, Ohio. On Feb. 13, 1914, President Wilson appointed him the first civil Governor of the Panama Canal Zone. This position he held until 1916, when he resigned and was made chairman of the board of inquiry in regard to the Adamson eight-hour law. He had been promoted to major general in 1915. He was state engineer of New Jersey in 1917 and in the same year became manager of the Emergency Fleet Corporation. Because of his lack of faith in the wooden fleet, he resigned after three months, and was appointed acting quarter-master general of the United States Army. In 1918 he was made chief of the division of purchase, storage, and traffic, and was also a member of the War Industries Board. At his own request, he was retired in 1919, after forty years' service, and he then became head of an engineering and construction company in New York. He had retired from this work several months before his death. General Goethals was associated with the Port of New York Authority for several years, and had much to do with the planning of the Holland tubes under the Hudson River between New York and Jersey City and with the plans for the bridge between New York and Fort Lee, N. J. He was the recipient of numerous honors, civic, military, and scientific, including the degree of LL.D. from the University of Pennsylvania and Princeton University. In 1915 the Congress of the United States thanked him formally, on behalf of the nation, for "distinguished service in constructing the Panama Canal."

GOITRE. OBJECTIONS TO IODIZED SALT AND DRINKING WATER. Despite the overwhelming evidence that goitre is favored by shortage of iodine in the soil water, evidence occasionally comes to light that goitre can prevail in regions where there is no iodine scarcity and may be absent where iodine scarcity is notable. It does not appear that in Great Britain there is any correlation between the two factors, although in parts of the world where the disease is highly prevalent this relationship is accepted as truth. This information is supplied from reports of the Rowett Research Institute at Aberdeen.

It has further been noted that the use of iodized salt is liable to cause acne in young women, who are most disposed both to ordinary acne and goitre. The acne from iodine disappears when the use of the salt is discontinued, but will return as soon as it is resumed. It is therefore possible that women and girls will object to this interference with their personal appearance.

GOLD. The U. S. Bureau of the Mint, with the cooperation of the U. S. Bureau of Mines, prepared the following statement of the preliminary estimate of refinery production of gold in the United States during the calendar year 1928: based on arrivals at U. S. Mints and Assay Offices and private refineries.

States	Gold	
	Ounces	Value
Alaska	309,668	\$6,401,400
Arizona	184,522	3,814,400
California	522,822	10,807,700
Colorado	253,577	5,241,900
Georgia	24	500
Idaho	20,545	424,700
Illinois
Michigan
Missouri
Montana	57,644	1,191,600
Nevada	174,895	3,615,400
New Mexico	31,705	655,400
North Carolina	34	700
Oregon	9,656	199,600
Pennsylvania	895	18,500
South Carolina	19	400
South Dakota	320,112	6,617,300
Tennessee	624	12,900
Texas	585	12,100
Utah	205,226	4,242,400
Washington	15,557	321,600
Wyoming	34	700
Philippine Islands	86,151	1,780,900
Totals	2,194,295	45,360,100

Production of Gold in Canada during 1927 amounted to 1,852,785 fine ounces valued at \$38,300,464, as compared with 1,754,228 fine ounces valued at \$36,263,110 in 1926. This establishes a new record. As a world producer of gold, Canada ranks third, with the Union of South Africa first and the United States second. In 1928 the gold output was expected to exceed that of 1927. The world production of gold in 1928 was estimated at \$417,000,000, an increase from \$412,000,000 in 1927, the increase coming from the Transvaal. This region in 1928 had an estimated production of \$220,000,000 as against \$215,000,000 in 1927. For commercial movement of gold in 1928, see FINANCIAL REVIEW.

² Estimate based on other years' production.

³ Amount exported.

GOLD COAST. A colony on the Gulf of Guinea in Africa belonging to Great Britain; bounded by the French Ivory Coast on the west, the French Sudan on the north, Togoland on the east, and extending on the south for 334 miles along the Gulf of Guinea; comprising in addition to the colony proper, Ashanti and the Northern Territories. The area of the three divisions is estimated at 80,000 square miles; population at the census of 1921, 2,078,043, of whom 2165 were Europeans. The capital and chief town is Accra, with a population of 38,000. Other large towns are Cape Coast (15,000), Sekondi (10,000), and Keta (10,000). In 1925-26 there were 22 government schools and 221 assisted schools,

which are under the control of various missions. The average attendance during 1926-27 at the primary and secondary schools was 29,332. There were also a large number of unassisted primary schools supported by the religious denominations.

Among the staple products, which also comprise the chief exports, are cocoa, palm oil, kola nuts, palm kernels, lumber, india-rubber, manganese, gold, and diamonds. The imports in 1927 were valued at £10,905,681; the exports, £14,005,002. The total value of the mineral products exported during the fiscal year ended Mar. 31, 1927, was £1,938,870—£803,369 for gold bullion, £715,382 for manganese ore, and £420,119 for diamonds. This valuation is the highest reached by the mineral industry of the colony. The revenue for 1926 was £4,365,321; the expenditure, £4,328,159; the public debt (Mar. 31, 1927), £11,791,000. In 1928 there were 394 miles of railway open to traffic and almost another hundred under construction. The shipping entered and cleared in the foreign trade in 1926 was 4,814,436 tons, of which 2,698,872 were British.

Ashanti, annexed by Great Britain in 1901, is under the Governor of the Gold Coast, although it has its own local laws and ordinances. The population at the census of 1921 was 407,000 of whom 400 were Europeans. Kumasi, with 20,000 inhabitants, is the chief town. In 1926-27 there were 789 pupils in the government schools and 3091 in the mission schools. The forests in the western part are rich in mahogany, cedar, and other valuable woods, and in trees that yield rubber, oil and gum copal, and fruits. Imports in 1926-27, £4,013,969; exports, £5,068,324; revenue, £102,214; local expenditure (except railway, posts, and telegraphs), £427,417.

The Northern Territories, constituted a British protectorate in 1901, are also under the Governor of the Gold Coast but locally administered by a high commissioner, with his headquarters at Tamale. Area, 35,000 square miles; population at the census of 1921, 527,914, of whom only 49 were Europeans. Navaro is the chief town with a population of about 15,000. Local revenue in 1926-27, £19,027; local expenditure, £118,793. Governor of the Gold Coast in 1928, Sir Alexander R. Slater; Chief Commissioner of Ashanti, T. S. W. Thomas; Chief Commissioner of Northern Territories, Maj. A. H. C. Walker-Leigh.

GOLF. Robert T. Jones, Jr., Johnny Farrell, Leo Diegel, Walter Hagen, Carl Kauffmann, T. P. Perkins, Miss Glenna Collett, and Mlle. Manette Le Blan were the leaders in golf during 1928. Jones for the fourth time captured the American amateur title, thus tying the mark set by Jerome D. Travers. Jones also put up a valiant battle to win the open championship. He was tied with Johnny Farrell, young professional, at the end of 72 holes only to lose out on the play-off. Diegel's greatest feat of the year was his victory in the Professional Golf Association tourney, where he successfully came through a field comprised of such players as Gene Sarazen, Walter Hagen, and Al Espinosa. Diegel also won the Canadian open title. Hagen scored the third triumph of his colorful career in the British open, but lost the P. G. A. honors which he had held for a period of four years. Kauffmann distinguished himself by winning the public links championship for the second year in succession. Perkins captured the British amateur

title. Miss Collett took the women's American amateur title for the third time and stamped herself as the foremost woman golfer of the day. Mlle. Le Blan was the victor in the British women's classic.

An international contest of paramount importance was the Walker Cup match held at Wheaton, Ill., the United States team winning 11 of the 12 competitions. The summary of the Walker Cup matches follows:

Jones, United States, defeated Perkins, Great Britain, 13 and 12; Von Elm, United States, defeated Tweddell, Great Britain, 3 and 2; Ouimet, United States, defeated Hazlet, Great Britain, 3 and 7; Sweetser, United States, defeated Hope, Great Britain, 1 up; Johnson, United States, defeated Storey, Great Britain, 4 and 2; Evans, United States, defeated Torrance, Great Britain, 1 up; Gunn, United States, defeated Hardman, Great Britain, 11 and 10; Mackenzie, United States, defeated Martin, Great Britain, 2 and 1; Sweetser and Von Elm, United States, defeated Perkins and Tweddell, Great Britain, 7 and 6; Jones and Evans, United States, defeated Hazlet and Hope, Great Britain, 5 and 3; Ouimet and Johnson, United States, defeated Torrance and Storey, Great Britain, 4 and 2; Gunn and Mackenzie, United States, defeated Beck and MacCallum, Great Britain, 7 and 5.

The winners of the more important tournaments of 1928 were:

United States National Open, Johnny Farrell; United States National Amateur, Robert T. Jones, Jr.; United States National (women), Miss Glenna Collett; United States Professional, Leo Diegel; Canadian Open, Leo Diegel; Canadian Amateur, R. Somerville; British Open, Walter Hagen; British Amateur, William Tweddell; British Women's, Mlle. Le Blan.

Princeton University for the second successive year captured the U. S. intercollegiate team championship, the individual title going to Maurice McCarthy, Jr., of Georgetown. Cambridge University defeated Oxford.

GOODCHILD, THE REV. DR. FRANK MARSDEN. American Baptist clergyman, died at New York, February 18. He was born at Philadelphia, Dec. 26, 1860, and was educated at Bucknell University (1884) and Crozer Theological Seminary (1887). He was ordained in the Baptist ministry in 1888, and after serving in pastorates at Amenia, N. Y., and Philadelphia, became pastor of the Central Church in New York City in 1895. He served there until 1924, when he became pastor emeritus. Bucknell University conferred the degree of D.D. on him in 1904. He was a prominent figure in the affairs of his denomination, and was president of the American and Foreign Bible Society; vice president of the Baptist Union for Ministerial Education; president of the Ministers' Home Society; and held other denominational offices. Dr. Goodchild was the leader of the "fundamentalists" of the Northern Baptist Convention. He contributed many articles to the religious press, published more than 500 sermons, and was a contributing editor of the *Watchman-Examiner*, New York.

GOODING, FRANK R. United States Senator from Idaho, died at Gooding, Idaho, June 24. He was born in England, Oct. 16, 1859, and was brought to America when he was eight years old. His family first settled in Michigan, and he was educated at the public schools at Paw Paw, Mich. When he was fifteen his family moved to California, and six years later he went to Idaho. He was for many years a contractor for mining companies in the Wood River country, and for thirty-four years before his death was actively engaged in farming and the raising of livestock. He was one of the largest sheep raisers in Idaho. Mr.

Gooding's first political office was membership in the State senate. He was also chairman of the Republican State Central Committee of Idaho, and was twice elected Governor of Idaho, serving 1905-08. He was elected to the United States Senate in 1920 for the term 1921-27, but before beginning his own term he was appointed to fill the vacancy caused by the resignation of Senator Nugent. In 1926 he was again elected for a full term. His name was given to the county and town of Gooding and to a Methodist Episcopal college of which he was known as a liberal benefactor.

GORDON BENNETT CUP COMPETITION. See **AERONAUTICS**.

GORDON, VICTOR. High commissioner for Newfoundland, died at London, October 6. He was born at St. Johns, Newfoundland, June 28, 1884, and after studying at St. Johns and at the Academeical Institution in Coleraine, Ireland, he worked for a time at a bank in Montreal. In 1912 he was called to the bar at the Inner Temple. He served with the British Army throughout the World War, on the Gallipoli Expedition and in Egypt and France, being seriously wounded at Monchy le Preux in April 1917 while engaged with the King's Own Scottish Borderers. Captain Gordon was made secretary of the High Commissioner for Newfoundland in 1919, and having acted as High Commissioner, 1922-24, he was given the permanent appointment. After representing Newfoundland at the Imperial Economic Conference in 1923, he served on the Imperial Economic Committee, 1925-26. He was made Companion of St. Michael and St. George in the latter year. He wrote extensively on Newfoundland.

GORDON-LENOX, CHARLES HENRY. See **RICHMOND AND GORDON, DUKE OF**.

GOSS, gös, WILLIAM FREEMAN MYRICK. American mechanical engineer and educator, died at New York, March 23. He was born at Barnstable, Mass., Oct. 7, 1859. He studied at Massachusetts Institute of Technology, 1877-79, and organized the department of practical mechanics at Purdue University, where he was dean of the school of engineering from 1890 to 1907. Thereafter he was dean of the college of engineering, director of the school of railway engineering and administration, and professor of railway engineering at the University of Illinois. He remained at Illinois until 1917, when he was made president of the Railway Car Manufacturers' Association, from which position he retired in 1925. In 1913-15 he was engineer for the committee of investigation of the smoke nuisance in Chicago. He served as president of the American Society of Mechanical Engineers in 1913. The great contributions of Professor Goss to the science of locomotive engineering were made when he was in charge of the department of practical mechanics at Purdue. He installed a full-sized locomotive, so mounted that speed and tractive effort, changeable at will, could be measured with precision, and with this he carried on tests, the results of which were transmitted annually to the American Railway Master Mechanics' Association and became embodied in improved practice in locomotive design. He received the degree of Doctor of Engineering from the University of Illinois in 1904. He was a member of many scientific societies, and wrote the following: *Bench Work in Wood* (1887; rev. ed., 1905); *Locomotive Sparks* (1902); *Locomotive Performance* (1907); *Super-*

heated Steam and Locomotive Service (1910); *Tests of a Jacobs-Shupert Boiler* (1921).

GOSSE, gös, SIR EDMUND WILLIAM. English poet, critic, and biographer, died at London, May 16. Born at London, Sept. 21, 1849, he was educated privately and did not have a university training, nevertheless later he received, in recognition of his services to letters, honorary degrees from the universities of Cambridge, St. Andrews, Strasburg, Gothenburg, and Paris (the Sorbonne). He received also a knighthood from King George (1925), and was a commander of the Legion of Honor of France and a member of orders of knighthood of Norway, Sweden, and Denmark. In 1867 he became assistant librarian of the British Museum, London; in 1875, translator to the Board of Trade; in 1884, Clark lecturer in English literature at Trinity College, Cambridge; and in 1904, librarian to the House of Lords. In 1884 he visited the United States, lecturing at Harvard, Yale, Johns Hopkins, and other universities. He was chairman of Scandinavian studies at University College, London, from 1917 until his death, and became president of the English Association in 1921. The especial field of literature cultivated by Gosse was that of combined biography and criticism, and his writings evinced wide knowledge and clear and well-balanced judgment. He was an accomplished linguist, especially in the Scandinavian languages, and it was he who, in his *Northern Studies*, introduced Henrik Ibsen and other Scandinavian writers to the notice of English readers. His obituary of Queen Victoria, published anonymously in January, 1901, in the *Quarterly Review*, was the literary sensation of the season. Gosse produced many books in verse and prose. Among them were: *Madrigals, Songs, and Sonnets* (1870); *On Viol and Flute* (1873); *Northern Studies* (1879); *History of Eighteenth Century Literature* (1889); *The Jacobean Poets* (1894); *Short History of English Literature* (1897); (with Richard Garnett) *An Illustrated History of English Literature* (1902); *Coventry Patmore* (1905); *Father and Son* (1907; an autobiographic work, crowned by the French Academy in 1913); *Henrik Ibsen* (1908); *Collected Essays* (5 vols., 1913); *Inter Arma* (1916); *The Life of Algernon Charles Swinburne* (1917); *Three French Moralists* (1918); *Diversions of a Man of Letters* (1919); *Malherbe* (1920); *Books on the Table* (1921); *Aspects and Impressions* (1922); *More Books on the Table* (1923); *Silhouettes* (1925); and *Leaves and Fruit* (1927).

GOUCHER COLLEGE. A non-sectarian college for women at Baltimore, Maryland; founded in 1885. The enrollment for the first semester of the year 1928-29 was 979 students, distributed as follows: First year students, 283; second year, 266; third year, 219; fourth year, 210, and graduate student, 1. The faculty had 103 members. The endowment funds of the College amounted to \$2,386,989. The library contained 40,500 volumes. President, William Westley Guth, Ph.D., LL.D.

GRAND ARMY OF THE REPUBLIC, THE. An order formed in 1866 among a number of former soldiers who had served in the Civil War. The first Post (No. 1) was organized in

Springfield, Ill., and given a charter by Dr. B. J. Stevenson, who had been active in securing its formation and who became the Department Commander of the States. This organization whose purpose is to enjoy "a companionship made sacred by common sufferings and sacrifices," has as its corner stones "Fraternity, Charity and Loyalty" and these demand the care and protection of sick and helpless comrades and their widows and orphans, the upholding of all comrades in their worthy endeavors, and loyalty to the flag and laws of the Republic. Auxiliary orders are the Woman's Relief Corps, Ladies of the G. A. R., Sons and Daughters of Union Veterans, and their auxiliaries. A national encampment is held in September, department encampments in June. Delegates to the national body are chosen by the Department of Encampments, and those to the Department Encampments by the Posts. The Sixty-second National Encampment was held at Denver, Colo., September, 1928, while Portland, Me., was chosen for the 1929 encampment. The officers elected for 1928-29 were: Commander-in-chief, John Reese, Broken Bow, Nebr.; senior vice commander-in-chief, James E. Jewel, Fort Morgan, Colo.; junior vice commander-in-chief, Henry J. Kearney, New York City; surgeon-general, S. W. Hopkins, Lodi, Calif.; and chaplain-in-chief, the Rev. J. King Gibson, Dayton, Ohio; trustee of the permanent fund, Louis F. Arensberg, East Millsboro, Pa. National headquarters were at 707 H. Street, Broken Bow, Nebr.

GRAPEFRUIT. See **HORTICULTURE**.

GRAPES. See **HORTICULTURE**.

GRAPHITE. The graphite industry in the United States in 1927 advanced on the whole, in spite of a slight reduction in total sales, for there was a considerable increase in the production of crystalline graphite, both in quantity and value, which more than offset a decrease in the production of the amorphous variety. Alabama, where the industry was most active during the War, experienced a revival in 1926 and 1927, after a period when the industry had almost died out, with three operators in 1927 reporting sales of 3,474,000 pounds of crystalline graphite, or two-thirds of the total output for the United States, and 74 per cent of the total value. There was also some activity in California, Michigan, Montana, Nevada, Rhode Island, Texas, and Virginia. According to statistics of the U. S. Bureau of Mines, the sales of natural graphite by producers in 1927 amounted to 5207 short tons, valued at \$232,971, a decrease of 5 per cent in quantity but an increase of 6 per cent in value, as compared with 1926. The output of the crystalline variety in 1927 amounted to 5,224,400 pounds, or 5 per cent more than in 1926. This was not only the largest output since 1920, but it exceeded the amount of amorphous graphite sold or used by producers for the first time since 1920, the value of the crystalline being \$197,121 and of the amorphous, \$35,850. Rhode Island was the largest source of amorphous graphite in 1927.

Natural graphite is used chiefly in the manufacture of pigments and paints, foundry facings, commutator brushes, crucibles, pencils, stove polish, lubricants, retorts, and batteries. Uses which were minor before the War were of much importance in 1927, as in pigments, while uses that formerly consumed large quantities were of relatively minor importance, as in the manu-

facture of crucibles. The Acheson Graphite Co., of Niagara Falls, N. Y., continued in 1927 to lead all competitors in the manufacture of graphite, its output being 12,257,239 pounds, as compared with 21,163,986 pounds in 1926, a decrease of 42 per cent in activity, but still an output greatly in excess of the total output of natural graphite. Madagascar continued to lead the world in exports of natural graphite, followed closely by Ceylon, the quantity exported being 14,239 and 13,091 metric tons, respectively. Imports of graphite into the United States in 1928 amounted to 17,591 short tons, valued at \$807,719, as compared with 17,452 short tons, valued at \$722,004 in 1927, an increase of 1 per cent in quantity, and a decrease of 12 per cent in value, as compared with 1927 figures for imports.

GRAVES, COL. CHARLES HINMAN. American soldier and diplomatist, died at Santa Barbara, Calif., October 7. He was born at Springfield, Mass., Aug. 14, 1839, and attended public schools in Boston, Mass., and Litchfield, Conn. At the outbreak of the Civil War he became sergeant in the Fortieth New York Infantry, June 27, 1861, and served throughout the war. He was commissioned second lieutenant Nov. 4, 1861, and successively promoted until at the end of the war, he was brevetted lieutenant-colonel, and colonel of volunteers, Mar. 13, 1865. He remained in the army, being commissioned first lieutenant in the Fourteenth U. S. Infantry, November 29 of that year, and was brevetted major, U. S. Army Mar. 2, 1867, for bravery at Gettysburg, and lieutenant-colonel for similar conduct at Fort Fisher. Retiring from the army in 1870, he engaged in various business enterprises at Duluth, Minn., and served in the Minnesota Senate, 1875-78. He was mayor of Duluth, 1881-83, and in 1889 was made speaker of the Minnesota House of Representatives, where he served until 1891. He acted as State capitol commissioner, 1893-1905. He was appointed United States Minister to Norway and Sweden in March, 1905, holding that position for a year, he was assigned to a similar office in Sweden, 1906-14.

GREAT BRITAIN. UNITED KINGDOM OF GREAT BRITAIN AND IRELAND. A constitutional monarchy comprising the British islands. Capital, London. Although the term literally applies only to the island including England, Scotland, and Wales, it is often used as above to include Ireland, the Isle of Man, and the Channel Islands. In view of the change in the status of Ireland, usage in this respect will probably be altered. The term British Empire applies to the United Kingdom and all its possessions and dependencies, that is to say, the dominions, colonies, protectorates, and other territories subject to the ultimate control of the British Parliament.

AREA AND POPULATION. The area of England, Scotland, Wales, the Isle of Man, and of the Channel Islands is 89,041 square miles; the area of Ireland, 32,586 square miles. (See **IRELAND**, **NORTHERN**, and **IRISH FREE STATE**.) The population of England, Scotland, and Wales in 1927 was 44,185,000. For details of the census of 1921 see **YEAR BOOK** for 1923 and preceding **YEAR BOOKS**.

The accompanying table from the *Statesman's Year Book* for 1928 gives a comparison of the estimated population (exclusive of Army, Navy, and merchant seamen abroad):

Year (30 June)	England and Wales	Scotland	Total of Great Britain
1914.....	36,960,684	4,747,167	41,707,851
1923.....	38,408,000	4,901,100	43,304,100
1924.....	38,746,000	4,881,637	43,627,637
1925.....	38,890,000	4,898,082	43,788,082
1926.....	39,067,000	4,897,000	43,964,000
1927 ^a	39,290,000	4,895,000	44,185,000

^a Provisional figures.

The provisional figures for the movement of population in England and Wales for 1927 were: Births, 654,969; deaths, 484,636; marriages, 307,818. Similar figures for Scotland were: Births, 96,669; deaths, 65,830; marriages, 32,589.

In 1927 the number of British subjects who emigrated to countries outside of Europe was 277,327; and the number of British subjects who returned from non-European countries was 173,724. The destinations of British subjects leaving the United Kingdom to take up permanent residence in non-European countries in 1926 were mainly the United States, 25,662; British North America, 52,916; Australia, 40,991; New Zealand, 7841; British South Africa, 7572; India and Ceylon, 6476.

Greater London, the largest city in the world, had a population in 1921 of 7,480,201 on the 443,449 acres covered by the Metropolitan and City Police districts. Registration London, which coincides with the administrative county and nearly coincides with the London Parliamentary boroughs, had a population of 4,484,523, with an area of 74,850 acres. The estimated population of Greater London in the middle of 1927 was 7,796,353. Birmingham, the second city of England, had a population in 1921 of 919,444 (estimated, 1927, 952,800). Liverpool continued to stand third, with 802,940 in 1921 (estimated, 1927, 872,900); and Manchester, fourth with 730,307 in 1921 (estimated 1927, 751,900). Other large cities with their populations are: Sheffield, 490,639 in 1921 (estimated in 1927, 524,900); Leeds, 458,232 in 1921 (estimated in 1927, 482,600); Bristol, 376,975 in 1921 (estimated in 1927, 385,700). Glasgow is the largest city in Scotland with a population of 1,034,174 in 1921 (estimated in June, 1927, 1,060,500); Edinburgh is next with 420,264 in 1921 (estimated in June, 1927, 426,300). The chief city of Wales is Cardiff, which had a population of 200,184 in 1921 and an estimated population of 225,600 in the summer of 1927. The census of 1921 did not include Ireland. For the populations of Australia, Canada, India, and other British possessions, see articles under those titles.

EDUCATION. Elementary instruction is free and compulsory between the ages of 5 and 14. In England and Wales in 1926 there were 21,336 schools, including public elementary, special, and certified efficient. The number of public elementary schools on Mar. 31, 1927, was 20,723, with 5,603,654 pupils on the registers and 169,702 teachers. There were also 555 special schools for the blind and deaf and for mentally and physically defective children; as well as 59 Poor Law schools, 28 nursery schools, and 265 play centres. The 109 training schools for teachers had 17,152 students, of whom 15,475 were training to teach in elementary schools. The number of secondary schools on the grant list in 1926 was 1310, with 367,290 pupils and 19,069 full-time teachers. In Scotland there were 2896 primary schools with an accommodation of 867,589 scholars; the average number on the regis-

ters was 658,963 and the average attendance 585,673. There were 18,372 certificated primary school teachers and 54 assistant teachers. In 1926-27 there were four training centres and three training colleges with 2515 students. In 1926 there were 249 secondary schools with a total accommodation of 179,814 and an average register of 152,537.

The accompanying table from the *Statesman's Year Book* for 1928 gives an estimate of the number of students and members of the teaching staff in the Universities of Great Britain in 1927-28:

Universities	Number of professors, etc.	Number of students
England:		
Oxford.....	228 ^a	4,417 ^b
Cambridge.....	346	5,475 ^b
Durham (1881).....	260	1,285
London (1836).....	1,089 ^a	9,468 ^{c,d}
Manchester (1880).....	263	2,466
Birmingham (1900).....	200	1,500
Liverpool (1903).....	389	2,038
Leeds (1904).....	315	1,415
Sheffield (1908).....	170	2,159 ^d
Bristol (1909).....	187	892
Reading (1926).....	138	1,563
Total for England.....	3,590	32,678
Scotland:		
St. Andrews (1411).....	116	700
Glasgow (1450).....	260	5,210
Aberdeen (1494).....	147	1,328
Edinburgh (1582).....	363	4,085
Total for Scotland.....	886	11,323
Wales (1903).....	363	3,526
Totals of above.....	4,839	47,527

^a Comprising 263 university professors and readers, and 826 "recognized teachers."

^b Undergraduates. ^c Internal students. In addition there are external students, i.e., matriculated students who have not taken a degree nor been registered as internal students. The number of these is not ascertainable but is probably greater than 9000.

^d Includes evening students.

^e Excluding College Tutors.

At most of the universities and university colleges women students are admitted on equal terms with men. There are, however, several colleges exclusively for female students; Bedford (62 teachers, etc., 600 students), Royal Holloway (35 teachers, 200 students), and Westfield colleges (16 teachers, etc., 147 students) in London; Newnham (11 teachers, etc., 277 students) and Girton (11 teachers, etc., 263 students) colleges in Cambridge; Lady Margaret Hall (8 teachers, etc., 134 students), Somerville College (10 teachers, etc., 156 students), St. Hugh's College (9 tutors, 150 students), St. Hilda's College (11 teachers, 108 students), in Oxford. The Society of Oxford Home Students numbered 235 students in 1928. Women were first admitted to membership of Oxford University, and to take degrees, in October, 1920.

AGRICULTURE. There were in the United Kingdom (including Northern Ireland) 14,707,000 acres of arable land in 1926, or about 24 per cent of the total area; 33,119,000 acres of permanent grass and pasture, much of it highly productive; and 295,000 acres of trees, shrubs, and bushes. Stock raising, including sheep raising, is carried on by intensive methods. The production of wool amounted to 117,676,000 pounds in 1927. The year 1927 was very unfavorable for agriculture. The price level of farm products, which was generally lower in 1926 than in any previous post-war year, fell still further. The difficult position was greatly aggravated by very unseasonable weather. Crops suffered from excessive rainfall. The tables on page 306, from the above mentioned source, show the distribution of the cultivated area and the livestock census of 1926 and 1927.

Cultivated area	England and Wales		Scotland	
	1926	1927	1926	1927
	<i>Acres</i>	<i>Acres</i>	<i>Acres</i>	<i>Acres</i>
Corn crops ^a	5,099,582	4,901,655	1,125,850	1,090,420
Green crops ^b	2,224,626	2,216,381	569,770	567,627
Hops	25,599	23,004
Small fruits ^c	69,523	69,154	7,811	8,064
Orchards ^c	240,689	248,705	1,264	1,288
Bare fallow	417,664	423,443	6,125	6,150
Clover and ro- tation grasses	2,502,237	2,460,892	1,484,979	1,496,363
Permanent pasture	15,128,186	15,280,243	1,498,635	1,512,597
Total	25,676,111	25,590,330	4,693,170	4,681,221

^a Corn crops are wheat, barley or bere, oats, mixed corn, rye, beans, peas.

^b Green crops are mainly potatoes, turnips and swedes, mangold, cabbage, kohlrabi, rape, vetches or tares.

^c In Scotland all orchard land is also included against the crop, grass or fallow beneath the trees. In England and Wales orchard land is only duplicated where small fruit is grown beneath the trees. The figures for small fruit in all cases, therefore, include small fruit in orchards.

Livestock	England and Wales		Scotland	
	June, 1926	June, 1927	1926	1927

MINING AND MANUFACTURING. Exports of anthracite and bituminous coal from Great Britain in 1927 amounted to 51,149,193 tons, as against 50,817,118 in 1925. Anthracite exports showed an increase of around 100,000 tons in 1927 over 1925, steam coal and household coal were about the same in each year, gas coal decreased approximately 251,000 tons, while sorts not specified increased 683,000 tons. Coke shipments declined from 2,111,757 tons in 1925 to 1,805,984 in 1927, but manufactured fuel increased from 1,160,561 tons to 1,348,861. Although exports of coal, coke, and briquets increased over 1925 shipments, their value was less in 1927.

According to the *Commerce Year Book* for 1928, the coal industry during 1927 passed through three more or less distinct phases. The first period was one of optimism, great activity, and remunerative trade, as a reaction from the disastrous mining stoppage which ended late in 1926. The second was one of intense competition, particularly for the regaining of export markets, with steadily declining price levels, increasing unemployment, substantial trading losses, and general depression. The third period, the closing months of the year, saw a continuation of depressed conditions, but with a tendency toward basic reorganization and reconstruction of the industry. This involved a movement toward centralized control of production, sales, and price levels in some of the leading districts, especially in the exporting areas. The recovery of 1927 brought the volume of coal production and exports even above the pre-stoppage level; but the decline in prices resulted in a net trading loss to the industry of £5,378,000. A steady increase in unemployment of miners occurred after the low point reached in May, 1927. There was a reduction of wages to the minimum rates allowed under the wage agreements. Substantial progress was made in the direction of more effi-
